The Berber's village is his state, and the government is vested in an assembly, the Jenda, formed of all males old enough to observe the fast at Ramadan. By them are determined all matters of peace or war, legislation, taxation and justice. The executive officer is the Amin, a kind of mayor, elected from some influential families in which the dignity is often in practice hereditary. He owes his position to the good-will of his fellows, receives no remuneration, and resigns as soon as he loses the confidence of the people. By him are appointed certain Temman (sing. Tamen) who act as overseers, though without executive powers, in the various quarters of the village. The poorest Berber has as great a voice in affairs as the richest. The undue power of the Jenda is checked by vendetta and a sort of lynch law, and by the formation of parties (sofs), within or without the assembly, for trade, political and other purposes. The Berbers are a warlike people who have never been completely subjugated. Every boy as soon as he reaches sixteen is brought into the Jenda and given weapons which he carries till he is sixty. Though each village is absolutely independent as far as its internal affairs are concerned, two or more are often connected by administrative ties to form an Arab or tribe. A number of these tribes form a Thakbit or confederation, which is an extremely loose organization. An exception to this form of government is constituted by the Tuareg, whose organization, owing to their peculiar circumstances of life, is monarchial. Wars are declared by special messengers; for every day of the week. Many Berbers still retain the Hereditary caste known as Marabouts are frequently in open opposition to the absolute authority of the Jenda. They are possessed of certain privileges, such as exemption from the chief taxes and the duty of bearing arms. They, however, often take a foremost part in tribal administration, and are frequently called upon to perform the office of arbitrators in questions of disputed policy, &c. In the Jenda, too, the Marabout at times takes the place of honour and keeps order. The Berbers, if irreligious, are very superstitious, never leaving their homes without exorcizing evil spirits, and have a good and evil interior. An exchange of speeches or guns renders an armistice inviolable. In some tribes a tablet, on which is inscribed the name of every man fit to bear arms, is placed in the mosque. The Berbers, though Mahomedans, do not often observe the prescribed ablutions; they break their fast at Ramadan, and eat wild boar's flesh and drink fig brandy. On the other hand, saints, both male and female, are paid more reverence by Berbers than by Arabs. Around their tombs their descendants settle, and thus sacred villages, often of considerable size, spring up. Almost every village, too, has its saint or prophet, and disputes other purposes. season and in travelling a burnous, usually a family heirloom, old and ragged; the women, in winter, throw a coloured cloth over their shoulders. The men's hair is cut short but their beards are allowed to grow. In some districts there are peculiar customs, such as the wearing of small silver nose-rings, seen in El-Jofra. The Berbers' weapons are those of the Arab: the long straight sword, the slightly curved and highly ornamented dagger, and the long gun. Berbers are not great town-builders. Their villages, however, are often of substantial appearance: with houses of untrammed stones, occasionally with two storeys, built on hills, and invariably defended by a bank, a stone wall or a hedge. Sometimes their homes are mere huts of turf, or of chaff tiles, made from the mold in which bread is baked.

The sloping roof is covered with reeds, straw or stones. The living room is on the right, the cattle-stall on the left. The dwelling is surrounded by a garden or small field of grain. The second storey is not added till a son marries. In the villages of the western Atlas the greater part of the upper storey consists of a sort of rough veranda. In this mountain district the natives spend the winter in vaults beneath the houses, and, for the sake of warmth, the tenements are built very close. Agriculture, which is carried on even in the mountain districts by means of laboriously constructed terraces, is the principal occupation of the Berbers. The plough, often replaced on the steeper slopes by the hoe, is similar to that depicted in ancient Egyptian drawings, and hand irrigation is usual. A sickle, toothed like a saw, is used for reaping. Corn is trodden by oxen, and kept in osier baskets narrowing to the top, or clay granaries. The staple crop is barley, but wheat, lentils, vetches, flax and gourds are also cultivated. Tobacco, maize and potatoes have been introduced; and the aloe, prickly pear, called in Morocco the Christian fig, are also found. The Kabyles understand grafting, have fine orchards and grow vines. The Beni-Abbas tribe in the Algerian Atlas is famed for its walnuts, and many tribes keep bees, chiefly for the commercial value of the wax. The Berber diet largely consists of cucumbers, gourds, water-melons and onions, and a small artichoke (Cynara humilis) which grows wild. At the beginning and end of their meal they drink a strongly sweetened liquid made from green tea and mint; tea-drinking probably became a habit in Morocco about the beginning of the 19th century; coffee came by way of Algiers. At feasts the food is served on large earthenware dishes with high basketwork covers, like bee-skeps but twice as high.

The Berbers make many indus-

tries. They mine and work iron, lead and copper. They have olive presses and flour mills, and their own millstone quarries, even travelling into Arab districts to build mills for the Arabs. They make lime, tiles, woodwork for the houses, domestic utensils and agricultural implements. They weave and dye several kinds of cloth, tan and dress leather and manufacture oil and soap. Without the assistance of the wheel the women produce a variety of pottery utensils, often of very graceful design, and decorated with patterns in red and black. Whole tribes, such as the Beni-Sliman, are occupied in the iron trade; the Beni-Abbas made firearms before the French conquest, and even cannon are said to have been made by boriing. Before it was proscribed by the French, the manufacture of gunpowder was general. The native jewellers make excellent ornaments in silver, coral and enamel. In some places wood-carving has been brought to considerable perfection; and native artists know how to engrave on metal both by etching and the burnin. In its collective industry the Berber race is far superior to the Arab. The Berbers are keen traders too, and, after the harvest, hawk small goods, traveling great distances.

A Berber woman has in many ways a better position than her Arab sister. True, her birth is regarded as an event of no moment, while that of a boy is celebrated by great rejoicings, and his mother acquires the right to wear on her forehead the tafsînâ, a mark which only the women who have borne an heir can assume. Her husband buys and can dismiss her at will. She has most of the hard work to do, and is little better than a servant. When she is old and past work, especially if she has not been the mother of a male child, she is often abandoned. But she has a voice in public affairs; she has laws to protect her, manages the household and goes unveiled; she has a right to the money she earns; she can inherit under wills, and bequeath property, though to avoid the alienation of real property, succession to it is denied her. But most characteristic of her social position is the Berber woman's right to enter into a sacred bond or agreement, repre-

sented by the giving of the anawa. This is some symbolic object, stick or what not, which passes between the parties to a contract, the obligations under which, if not fulfilled by the contracting parties during their lives, become the inheritance of the woman's daughter; and the Berber pays his wife the compliment of monogamy. The Kabyle women have stood side by side with their husbands in battle. Among many Berber tribes the law of inheritance is such that the eldest daughter's son succeeds. South of Morocco proper, Gerhard Rohlfs, who travelled extensively in the region (c. 1860-1867), states that a Berber religious corporation, the Savia Kartas, was ruled over by a woman, the chief's wife. The Berbers consult their women in many matters, and only one woman is really held in low esteem. She, curiously, is the wife of the chief, derived. Women have been allowed to bequeath sons. The Kabyles have many names in the Canary Islands and other remains of the aboriginal language there prove it to have been the native tongue. Although the Berber tongue shows a certain affinity with Semitic in the construction both of its words and sentences Berber is quite distinct from the Semitic languages; and a remarkable fact is that in spite of the enormous space over which the dialects are spread and the thousands of years that some of the Berber peoples have been isolated from the rest, these dialects show but slight differences from the long-extinct Egyptian. Archaic Berber may be called, the Kabyle, the Shilha, the Zenati, the Tuareg or Tamashke, the Berber language is still essentially one, and the similarity between the forms current in Morocco, Algeria, the Sahara and the far-distant oasis of Siwa is much more marked than between the Norse and English in the sub-Aryan Teutonic group. The Berbers have, moreover, a writing of their own, peculiar and little used or known, the antiquity of which is proved by monuments and inscriptions ranging over the whole of North Africa. The various spoken dialects, though apparently very unlike each other, are not more dissimilar than are Portuguese, Spanish, French and Italian, and their differences are doubtless attributable to the lack of a literary standard. Even where different words are used, there is evidence of a common stem from which the various branches have sprung. The great difficulty of satisfactory comparison arises from the fact that few of the Beber dialects possess any writings. The Tawâhid (The Unity of God), said to have been written in Moroccan Berber and believed to be the oldest African work in existence, except Egyptian and Ethiopic, was the work of the druzahadi leader Ibn Râshid, at a time when the officials of the Kairawan mosque were dismissed because they could not speak Berber. Most of the writings found, however, have been in the form of inscriptions, chiefly on ornaments. A collection of the various signs of the alphabet has shown thirty-two letters, four more than Arabic. De Slane, in his notes on the Berber historian Ibn Khaldûn, shows the following points of similarity to the Semitic class:—its tri-literal roots, the inflections of the verb, the formation of derived verbs, the genders of the second and
BERCEUSE—BEREKHIAH NAQDAN

third persons, the pronounal affixes, the aoristic style of tense, the whole and broken plurals and the construction of the phrase.

Among the peculiar grammatical features of Berber may be mentioned two numbers (no dual), two genders and six cases, and the declension of three radicals, and imperative and aorist tense only. As might be expected the Berber tongue is most common in Morocco and the western Sahara—the regions where Arab dominion was least exercised. When Arabic is mentioned as the language of Morocco it is seldom realized how small a proportion of its inhabitants use it as their mother tongue. Berber is the real language of Morocco, Arabic that of its creed and government.

BERCHEM (or BERGHEN), NICOLAAS (1620-1683), Dutch painter, was born at Haarlem. He received instruction from his father (Pieter Claesz van Haarlem) and from the painters W. Huygens and W. M. van der Meulen. It is not known why he called himself Berchem (or Berghem, and other variants). His pictures, of which he produced an immense number, were in great demand, as were also his etchings and drawings. His landscapes are highly esteemed; and many of them have been finely engraved by John Visscher. His finest pictures are at the Amsterdam Museum and at the Hermitage, St Petersburg.

BERCHTA (English Bertha), a fairy in South German mythology. She was at first a benevolent spirit, the counterpart of Hulda in North German myth. Later her character changed and she became a witch. In Pagan times Bertha had the rank of a minor deity.

BERCHTESGADEN, a town of Germany, beautifully situated on the south-eastern confines of the kingdom of Bavaria, 1700 ft. above the sea on the southern declivity of the Untersberg, 6 m. S.S.E. from Reichenhall by rail. Pop. (1890) 10,646. It is celebrated for its extensive mines of rock-salt, which were worked as early as 1174. The town contains three old churches, of which the early Gothic church with its Romanesque cloister is most notable, and some good houses. Apart from the salt works with its industries include toys and other small articles of wood, horn and ivory, for which the place has long been famous. The district of Berchtesgaden was formerly an independent spiritual principality, founded in 1100 and secularized in 1803. The abbey is now a royal castle, and in the neighbourhood a hunting-lodge was built by King Maximilian II. in 1852.

BERCK, a bathing resort of northern France, in the department of Pas-de-Calais, 25 m. S. of Boulogne by rail. Pop. (1906) 7638. It comprises two parts—Berck-Ville, 14 m. from the shore, and Berck-Plage, the latter with a fine sandy beach. There are two children's hospitals, the climate proving peculiarly beneficial in the treatment of bronchial affections. 150 boats are employed in the fisheries, and herrings form the staple of an active trade. Boat-building and fish-curing are carried on.

BERDICHIEV, a town of W. Russia, in the government of Kiev, 116 m. S.W. of Kiev by rail and not far from the borders of Volhynia. The cathedral of the Assumption, finished in 1873, is the principal place of worship. The fortified Carmelite monastery, founded in 1627, was captured and plundered by Czartorinski, chief of the Zaporogian Cossacks, in 1647, and desolated in 1864. An extensive trade is carried on in peltry, silk goods, iron and wooden wares, salt fish, grain, cattle and horses. Four fairs are held yearly, the most important being on the 1st of June and the 15th of August. The numerous minor industries include the manufacture of tobacco, soap, candles, oil, bricks and leather. Pop. (1867) 52,562; (1897) 53,728, Jews forming about 8%. In the treaty of demarcation between the Lithuanians and the Poles in 1546 Berdichev was assigned to the former. In 1768 Pulaski, leader of the confederation of Bar, fled, after the capture of that city, to Berdichev, adopting the name of Kierzow, and remaining there for a period of twenty-five years. The town belongs to the Radziwill family.

BERDYANSK, a seaport town of Russia, in the government of Taurida, on the north coast of the Sea of Azov, in 46° 45' N. lat. and 36° 40' E. long. The principal industries are in bricks and tiles, tallow and macaroni. The roads are protected from every wind except the south, which occasions a heavy surf; but against this a mole was constructed in 1863. The chief articles of export are cereals, flour, wool, hemp, skins and fish; and the imports include hardwoods, fruits, oil and tobacco. In the southern part of the town, in the Kuznetsky, are lagoon industries. Pop. (1867) 12,223; (1900) 29,168.

BEREA, a town of Madison county, Kentucky, U.S.A., 131 m. by rail S. of Cincinnati. Pop. (1900) 762. Berea is served by the Louisville & Nashville railway. It is pleasantly situated on the border between the Blue Grass and the Mountain region. The town is widely known as the seat of Berea College, which has done an important work among the mountaineers of Kentucky and of Tennessee. The college has about 70 acres of ground (and about 4000 acres of mountain land for forestry study), with a large recreation hall, a library, a chapel (seating 1000), a southern college hall, a brick work and flower plant, a woodwork building, a printing building, a tabernacle for commencement exercises and other buildings. In 1908 Berea had 65 instructors and 1150 students; and it paid the tuition of 141 negro students in Fisk University (Nashville, Tennessee) and in other institutions. The school out of which Berea College has developed was founded in the anti-slavery interests in 1855. An attempt was made to procure for it a college charter in 1859, but the slavery interests caused it to be closed before the end of that year and it was not reopened until 1877; the charter having then been obtained, as Berea College. Negroes as well as whites were admitted until 1904, when education of the two races at the same institution was prohibited by an act of the state legislature (upheld by the U.S. Supreme Court in 1908). This act did not, however, prohibit an institution from maintaining separate schools for the two races, provided these schools were at least 25 m. apart, and a separate school for the negroes was at once projected by Berea.

BEREKHIAH NAQDAN, Jewish fabulist, author of a collection of Fox Fables, written in Hebrew. As his title implies (Naqdan = author of the bibliographical text), Berakhiah was also a grammarian. He further wrote an ethical treatise and was the author of various translations. His date is disputed. Most authorities place him in the 13th century, but J. Jacobs has identified him with Benedictus le Puncteur, an English Jew of the 12th century.
BERENGIUS [Berengar] (d. 1088), medial theologian, was born at Tours early in the 11th century; he was educated in the famous school of Fulbert of Chartres, but even in early life seems to have exhibited great independence of judgment. Appointed superintendent of the cathedral school of his native city, he taught with such success as to attract pupils from all parts of France, and powerfully contributed to diffuse an interest in the study of logic and metaphysics, and to introduce that dialectical development of theology which is designated the scholastic. The earliest of his writings of which we have any record is an Exhortatory Discourse to the hermits of his district, written at their own request; and this was followed by other discourses on the doctrine of the transubstantiation, on the Paschasius, on the doctrine of the Sacrament (Hadri. i. 630), and on the position and reputation of Berengar. He was, moreover, an accomplished scholar, and was the author of Dissertations on the Miracle of the Host (Eng. trans.), and Neander, vii. 287-290 (Eng. trans.); A. Harnack, History of Dogma, 1. 225-238. (English trans.); and Herrmann Reut. Geschichte der religiösen Aufklärung des

ostri temporis." An attempt was made at the council of Poitiers in 1076 to ally the agitation caused by the controversy, but it failed, and Berengar narrowly escaped death in a tumult. Hildebrand, now pope as Gregory VII., next summoned him to Rome, and, in a synod held there in 1078, tried once more to obtain a declaration of his orthodoxy by means of a confession of faith drawn up in general terms; but even this strong-minded and strong-willed pontiff was at length forced to yield to the demands of the multitude and its leaders; and in another synod at Rome (1079), finding that he was only embarrassing his own position and reputation, he turned unexpectedly upon Berengar and pronounced that his writings were impious and his spirit unholy. He was therefore excommunicated, and his writings branded as "substantial" in the sacrament and bread and wine into the body and blood of Christ. "Then," says Berengar, "confounded by the sudden madness of the pope, and because God in punishment for my sins did not give me a steadfast heart, I threw myself on the ground, and confessed with impious voice that I had erred, fearing the pope would instantly pronounce against me the sentence of condemnation, and, as a necessary consequence, that the populace would hurry me to the worst of deaths." He was kindly dismissed by the pope not long after, with a letter recommending him to the protection of the bishops of Tours and Angers, and anathema was pronounced on all who should do him any injury or call him a heretic. He returned home overwhelmed with shame and bowed down with sorrow for having a second time been guilty of a great impiety. He immediately recalled his forced confession, and besought all Christian men "to pray for him, so that his tears might secure the pity of the Almighty." He now saw, however, that the spirit of the age was against him, and hopelessly given over to the belief of what he had combated as a delusion. He withdrew, therefore, into solitude, and passed the remainder of his days in retirement and prayer on the island of St. Côme near Tours. He died there in 1088.

Berengar left behind him a considerable number of followers. All those who in the middle ages denied the substantial presence of the body and blood of Christ in the eucharist were commonly designated Berengarians. They differed, of course, in many respects, even in regard to the nature of the supper. Berengar's own views—on the subject may be thus summed up:—1. That bread and wine should become flesh and blood and yet not lose the properties of bread and wine was, he held, contradictory to reason, and therefore irreconcilable with the truthfulness of God. 2. He admitted a change (conversio) of the bread and wine into the body of Christ, in the sense that to those who receive them they are transformed by grace into higher powers and influences —into the true, the intellectual or spiritual body of Christ. The unbelieving receive the external sign and sacrament; but the believing receive in addition, although invisibly, the reality represented by the sign, the res sacramenti. 3. He rejected the notion that the sacrament of the altar was a constantly renewed sacrifice, and held it to be merely a commemoration of the one sacrifice of Christ. 4. He dwelt strongly on the importance of men looking away from the externals of the sacrament to the spirit of love and piety. The transubstantiation doctrine seemed to him full of evil, from its tendency to lead men to overvalue what was sensuous and transitory. 5. He rejected with indignation the miraculous stories told to confirm the doctrine of transubstantiation. 6. Reason and Scripture seemed to him the only grounds on which a true doctrine of the Lord's supper could be rested. He attached little importance to mere ecclesiastical tradition or authority, and none to the voice of majorities, even when sanctioned by the decree of a pope. In this, as in other respects, he was a precursor of Protestantism.

The opinions of Berengar are to be ascertained from the works written in refutation of them by Adelmann, Lanfranc, Guimund, &c.; from the fragments of the De sac. coena adv. Lanfr. liber, edited by Stadulini (1829-1829); and from the Liber posterior, edited by A. F. and T. Vischer (1834). See the collection of texts by A. F. and T. Vischer (1830); also the Histoire des hérétiques, and the Histoire de la philosophie scolaïsque, ii. 225-238; and Herrmann Reut. Geschichte der religiösen Aufklärung des
BÉRÉNGER—BERENICE

BÉRÉNGER, ALPHONSE MARIE MARCELLIN THOMAS (1785-1860), known as Bérenger de la Drôme, French lawyer and politician, son of a deputy of the third estate of Dauphiné to the Constituent Assembly, was born at Valence on the 31st of May 1795. He entered the magistracy and became procureur général at Grenoble, but resigned his office on the restoration of the Bourbons. He now devoted himself mainly to the study of criminal law, and in 1818 published La Justice criminelle en France, in which with great courage he attacked the special tribunals, provosts’ courts or military commissions which were the main instruments of the Reaction, and advocated a return to the old common law and trial by jury. The book had a considerable effect in discreditng the reactionary policy of the government; but it was not until 1828, when Bérenger was elected to the chamber, that he had an opportunity of exercising a court’s political influence on affairs as a member of the group known as that of constitutional opposition. His courage, as well as his moderation, was again displayed during the revolution of 1830, when, as president of the parliamentary commission for the trial of the ministers of Charles X., he braved the fury of the mob and secured a sentence of imprisonment in place of the death penalty for which they clamoured.

His position in the chamber was now one of much influence, and he had a large share in the moulding of the new constitution, though his effort to secure a hereditary peerage failed. Above all he was instrumental in framing the new criminal code, based on humanist, but principles, which was issued in 1835. It was due to him that, in 1832, the right, so important in actual French practice, was given to juries to find “extenuating circumstances” in cases when guilt involved the death penalty. In 1831 he had been made a member of the court of appeal (cour de cassation), and the same year was nominated a member of the academy of moral and political sciences. He was raised to the peerage in 1839. This dignity he lost owing to the revolution of 1848; and as a politician his career now ended. As a judge, however, his activity continued. He was president of the high courts of Albe, Burgundy, and Versailles in 1849. Having been appointed president of one of the districts of the court of cassation, he devoted himself entirely to judicial work until his retirement, under the age limit, on the 31st of May 1860. He now withdrew to his native town, and occupied himself with his favourite work of reform of criminal law. In 1833 he had shared in the foundation of a society for the reclamation of young criminals, in which he continued to be actively interested to the end. In 1851 and 1852, on the commission of the academy of moral sciences, he had travelled in France and England for the purpose of examining and comparing the penal systems in the two countries. The result was published in 1855 under the title La Répression pénale, comparaison du système pénitentiaire en France et en Angleterre.

He died on the 15th of May 1866.

His son, RENÉ BÉRÉNGER (1839— ), continued the work of his father, and at the outbreak of the revolution of 1870 was avocat général of Lyons. He served as a volunteer in the Franco-German War, being wounded at Nuits on the 28th of December. Returned to the National Assembly by the department of Drôme, he was for a few days in 1873 minister of public works under Thiers. He then entered the senate, of which he was vice-president from 1894 to 1897. He founded in 1871 a society for the reclamation of discharged prisoners, and presided over various bodies formed to secure improvement of the public morals. He succeeded Charles Lucas in 1890 at the Academy of Moral and Political Science.

BERENICE, or BEREINE, the Macedonian forms of the Greek Phereine, the name of (A) five Egyptian and (B) two Jewish princesses.

(A) 1. BERENICE, daughter of Lagus, wife of an obscure Macedonian soldier and subsequently of Ptolemy Soter, with whose bride Eurydice she came to Egypt as a lady-in-waiting. Her son, Ptolemy Philadephus, was recognized as heir over the heads of Eurydice’s children. So great was her ability and her influence that Pyrrhus of Epirus gave her name Berenices to a new city. Her son Philadephus decreed divine honours to her on her death. (See Theocritus, Idyls xv. and xvi.)

2. BERENICE, daughter of Ptolemy Philadephus, wife of Antiochus Theos of Syria, who, according to agreement with Ptolemy (240), had divorced his wife Laodice and transferred the succession to his daughter’s children. On Ptolemy’s death, Antiochus repudiated Berenice and took his wife Laodice, who, however, at once poisoned him and murdered Berenice and her son. The prophecy in Daniel xi. 6 seq. refers to these events.

3. BERENICE, the daughter of Magas, king of Cyrene, and the wife of Ptolemy III. Euergetes. During her husband’s absence on an expedition to Syria, she dedicated her hair to Venus for his safe return, and placed it in the temple of the goddess at Zephyrium. The hair having by some unknown means disappeared, Conon of Samos, the mathematician and astronomer, explained the phenomenon in early phrase, by saying that it had been carried to the heavens and placed on the stars. The name Cuma Berenices, applied to a constellation, commemorates this incident. Callimachus celebrated the transformation in a poem, of which only a few lines remain, but there is a fine translation of it by Catullus. Soon after her husband’s death (221 B.C.) she was murdered at the instigation of her son Ptolemy IV., with whom she was probably associated in the government.

4. BERENICE, also called CLEOPATRA, daughter of Ptolemy X., married as his second husband Alexander II., grandson of Ptolemy VII. He murdered her three weeks after their marriage.

5. BERENICE, daughter of Ptolemy Auletes, eldest sister of the great Cleopatra. The Alexandrians placed her on the throne in succession to her father (58 B.C.). She married Seleucus Cybiosces, but soon caused him to be slain, and married Archelas, who had been made king of Comana in Pontus (or in Cappadocia) by Pompey. Auletes was restored and put both Berenice and Archelas to death in 55 B.C.

1) BERENICE, daughter of Salome, sister of Herod I., and wife of her cousin Aristobulus, who was assassinated in 6 B.C. Their relations had been unhappy, and she was accused of complicity in his murder. By Aristobulus she was the mother of Herod Agrippa I. Her second husband, Theudion, uncle on the mother’s side of Antipodes, son of Herod I., having been put to death for conspiring against Herod, married Archelas. Subsequently she went to Rome and enjoyed the favour of the imperial household.

2. BERENICE, daughter of Agrippa I., king of Judaea, and born probably about A.D. 28. She was first married to Marcus, son of the abalarch Alexander of Alexandria. On his early death she married Herod, brother of Chæles, after whose death (A.D. 48) she lived for some years with her brother, Agrippa II. Her third husband was Polemon, king of Cilicia, but she soon deserted him, and returned to Agrippa, with whom she was living in 60 when Paul appeared before him at Caesarea (Acts xxviii.). During the devastation of Judea by the Romans, she fascinated Titus, whom along with Agrippa she followed to Rome as his promised wife (A.D. 75). When he became emperor (A.D. 79) he dismissed her finally, though reluctantly, to her own country. Her influence had been exercised vainly on behalf of the Jews in A.D. 66, but the burning of her palace alienated her sympathies. For her influence see Juvenal, Satires, vi., and Tacitus, Hist. ii. 2.

BERENICE, an ancient seaport of Egypt, on the west coast of the Red Sea, in 23° 56’ N., 35° 34’ E. Built at the head of a gulf, the Sinus Immundus, or Foul Bay, of Strabo, it was sheltered on the north by Ras Benas (Lepte Extrema). The port is now nearly filled up, has a sand-bar at its entrance and can be reached only by small craft. Most important of the ruins is a temple; the remnants of its sculptures and inscriptions preserve the name of Tibbers and the figures of many deities, including a goddess 1 Alamchar or Arrabakh (Gr. Ἀλαμχαρη, or Αρραβάκη), the name of the head magistrate of the Jews in Alexandria under the Ptolemaic and Roman rules.
BERESFORD, LORD CHARLES WILLIAM DE LA POER (1816-__), British admiral, second son of the 4th marquess of Waterford, was born in Ireland, and entered the "British Navy" as a naval cadet in 1839. He became lieutenant in 1866, and commander in 1875. In 1874 he was returned to parliament as Conservative M.P. for Waterford, retaining his seat till 1880, and he was already known in this period as a gallant officer, with a special interest in naval administration. In 1875-1876 he accompanied the then prince of Wales on his visit to India as naval A.D.C.; from 1878 to 1881 he was commander of the royal yacht, "Osborne." He was in command of the gunboat "Condor" in the Mediterranean when the Egyptian crisis of 1882 occurred; and he became a popular hero in England in connexion with the bombardment of Alexandria (July 11), when he took his ship close in to the forts and engaged them with such conspicuous gallantry that the admiral ordered a special signal: "Well done, Condor!" He was promoted captain for his services, and, after taking an active part in the re-establishment of order in Alexandria, was appointed in Egypt and in the Mediterranean the command of the expedition of 1884-85, commanding the naval brigade at Abu Klea, Abu Kru and Metemneh, and, with the river steamer "Safieh," rescuing Sir C. Wilson and his party, who had been wrecked on returning from Khartum (Feb. 4, 1885).

In November 1885 he was again returned to parliament as member for East Marylebone (re-elected 1886), and in Lord Salisbury's ministry of 1886 he was appointed a lord of the admiralty. The press agitation in favour of a stronger navy was now in full swing, and it was well known that in Lord Charles Beresford it had an active supporter, but very little impression was made on the government, and in 1888 he resigned his office on this question, a dramatic step which had considerable effect. In the House of Commons he advocated an expenditure of twenty millions sterling on the fleet, and the passing of the Naval Defence Act in 1889 was largely due to his action. At the end of 1889 he became captain of the cruiser "Undaunted" in the Mediterranean, and when this ship was paid off in 1893 he was appointed in command of the steam reserve at Chatham, a post he held for three years. In 1897 he became rear-admiral, and again entered parliament, winning a by-election at York; he retained his seat till 1900, but was mainly occupied during these years by a mission to China on behalf of the Associated Chambers of Commerce; he published his book The Break-up of China in 1890. In 1902 he was returned to parliament for Woolwich, but resigned on his appointment to command the Channel squadron (1903-1905); in 1905 he was given the command of the Mediterranean fleet, and from 1906 to 1909 was commander-in-chief of the Channel fleet; in 1906 he became a full admiral. At sea he had always shown himself a remarkable disciplinarian, possessed of great influence over his men, and his reputation as one who would, if necessary, take the lead in the most terrific fighting was well known; and, even when serving aforesaid and therefore unable to speak direct to the public, he was in the forefront of the campaign for increased naval efficiency. During the administration (1903-1910) of Sir John Fisher (see Fisher, BARON) as first sea lord of the admiralty it was notorious that considerable friction existed between them, and both in the navy and in public a great deal of party-spirit was engendered in the discussion of their opposing views. When Lord Charles Beresford's term expired as commander-in-chief in March 1909 he was finally "unmuzzled," and the attack which for some years his supporters had made against Sir J. Fisher's administration came to a head at a moment coinciding with the new shipbuilding crisis occasioned by the revelations as to the increase of the German fleet. He himself came forward with proposals for a large increase in the navy and a reorganization of the administrative system, his first step being a demand for an inquiry, to which the government promptly assented (May) in the shape of a small Committee under the prime minister. Its report (August), however, gave him no satisfaction, and he proceeded with his public campaign, bitterly attacking the ministerial policy. In January 1910, at the general election, to which he had already been appointed a M.P. for Portsmouth; but meanwhile Sir John Fisher's term of office came to an end, and in his successor, Admiral Sir Arthur Kayeby Wilson (b. 1824), the navy obtained a first sea lord who commanded universal confidence.

BERESFORD, JOHN (1738-1803), Irish statesman, was a younger son of Sir Marcus Beresford, who, having married Catherine, sole heiress of James Power, 3rd earl of Tyrone, was created earl of Tyrone in 1746. After the death of the earl in 1753, Beresford's mother successfully asserted her claim suo jure to the barony of La Poer. John Beresford, born on the 14th of March 1738, thus inherited powerful family connexions. He was educated at Trinity College, Dublin, was called to the Irish bar, and entered the Irish parliament as member for Waterford in 1760. His industry, added to the influence of his family, procured his admission to the privy council in 1768, and his appointment as one of the commissioners of revenue two years later. In 1780 he became first commissioner of revenue, a position which gave him powerful influence in the Irish administration. He introduced some useful reforms in the machinery of taxation, and he was the author of many improvements in the architecture of the public buildings and streets of Dublin. He was first brought into conflict with Grafton and the popular party, in 1784, by his support of the proposal that the Irish parliament in return for the removal of restrictions on Irish trade should be bound to adopt the English navigation laws. In 1786 he was sworn a member of the English privy council, and the power which he wielded in Ireland through his numerous dependants and connexions grew to be so extensive that a few years later he was spoken of as the "king of Ireland." He was a vehement opponent of the increasing demand for relief of the Roman Catholics, and when it became known that Lord Fitzwilliam was to succeed Lord Westmorland as lord lieutenant in 1795 for the purpose of carrying out a conciliatory policy, Beresford expressed strong hostility to the appointment. One of Fitzwilliam's first acts was to dismiss Beresford from his employment but with permission to retain his entire official salary for life, and with the assurance that no other member of his family would be removed. Beresford immediately exerted all his influence with his friends in England, to whom he described himself as an injured and persecuted man; he appealed to Pitt, who, in a long letter to a friend, described the dismissal as "an open breach of the most solemn promise." In a letter to Lord Carlisle,justifying his action, Fitzwilliam mentioned that malversation had been imputed to Beresford. Beresford sent a challenge to Fitzwilliam, but the combatants were interrupted on the field and Fitzwilliam then made an apology.

When Lord Camden replaced Fitzwilliam in the viceroyalty in March 1795, Beresford resumed his former position. On the eve of the rebellion in 1798 his letters to Lord Auckland gave an alarming description of the condition of Ireland, and he counselled strong measures of repression. When first consulted by Pitt on the question of the union Beresford appears to have disliked the idea; but he soon became reconciled to the policy and warmly supported it. After the union Beresford continued to represent

1 Standhope, Life of Pitt, ii. 301.
BERESFORD—BERG

Waterford in the imperial parliament, and he remained in office till 1802, taking an active part in settling the financial relations between Ireland and Great Britain. He died near Londonderry on the 5th of November 1805. John Beresford was twice married: in 1760 to a foreign lady, Constantia Ligondes, who died in 1772; and, secondly, in 1774 to Barbara Montgomery, a celebrated beauty who figures in Sir Joshua Reynolds's picture of "The Ladies of Cornwall." He had large estates by the Irish sea. His son, John Claudius, kept a riding school in Dublin, which acquired an evil reputation as the chief scene of the floggings by which evidence was extorted of the conspiracy which came to a head in 1798. He took a prominent part in the Irish House of Commons, where he unsuccessfully moved the reduction of the proposed Irish contribution to the imperial exchequer in the debates on the Act of Union, of which, unlike his father, he was to the last an ardent opponent.

BERESFORD, WILLIAM CARR BERESFORD, VISCOUNT (1765-1854), British general and Portuguese marshall, illegitimate son of the first marquess of Waterford, was born on the 2nd of October 1765. He entered the British army in 1783, and in 1807, and while in Nova Scotia with his regiment in the following year lost the sight of one eye by a shooting accident. He first distinguished himself at Toulon in 1793, receiving two wounds by firing from the gun of the 88th regiment (Connaught Rangers). In 1799 his regiment was ordered to India, and a few months later Beresford left with Sir David Baird's expedition for Egypt, and was placed in command of the first brigade which led the march from Kossor across the desert. When, on the evacuation of Egypt in 1803, he returned home, his reputation was established. In 1805 he accompanied Sir David Baird to South Africa, and was present at the capture of Cape Town and the surrender of the colony. From South Africa he was despatched to South America. He had a hand by side. By his capturing Buenos Aires with only a couple of regiments. But this force was wholly insufficient to hold the colony. Under the leadership of a French émigré, the chevalier de Tiniers, the colonists attacked Beresford, and at the end of three days' hard fighting he was compelled to capitulate. After six months' imprisonment he escaped, and reached England in 1807, and at the end of that year he was sent to Madeira, occupying the island in the name of the king of Portugal. After six months in Madeira as governor and commander-in-chief, during which he learnt Portuguese and obtained an insight into the Portuguese character, he was ordered to join Sir Arthur Wellesley in Lisbon, and was promoted to the command in Lisbon, but accompanied Sir John Moore on the advance into Spain, and took a conspicuous part in the battle of Corunna (see Peninsular War). In February 1809 Beresford was given the task of reorganizing the Portuguese army. In this task, by systematic weeding-out of inefficient officers and men, he succeeded beyond expectation. By the summer of 1810 he had so far improved the moral and discipline of the force that Wellington brigaded some of the Portuguese regiments with English ones, and at Busaco Portuguese and English fought side by side. By his capturing Buenos Aires with only a couple of regiments by the British government with a knighthood of the Bath and by the Portuguese with a peerage.

In the spring of 1811 Wellington was compelled to detach Beresford from the Portuguese service. The latter was next in seniority to General (Lord) Hill who had gone home on sick leave, and on him, therefore, the command of Hill's corps now devolved. Unfortunately Beresford never really gained the confidence of his new troops. At Campo Mayor his light cavalry brigade got out of hand, and a regiment of dragoons was practically annihilated. He invested Badajoz with insufficient forces, and with the result the town surrendered without he being made a siege and offer battle at Albuera. His personal courage was even more than usually conspicuous, but to the initiative of a junior staff officer, Colonel (afterwards Viscount) Hardinge, rather than to Beresford's own generalship, was the hardly-won victory to be attributed. Beresford then went back to his work of reorganizing the Portuguese army. He was present at the siege of Badajoz and at the battle of Salamanca, where he was severely wounded (1812). In 1813 he was present at the battle of Vittoria, and at the battles of the Pyrenees, while at the battle of the Pyrenees, while at the battle of the Nive, he distinguished himself. In 1814 he commanded the British centre, and later he led a corps at the battle of Toulouse. At the close of the Peninsular War he was created Baron Beresford of Albuera and Cappoquin, with a pension of £2000 a year, to be continued to his two successors.

In 1819 the revolution in Portugal led to the dismissal of the British officers in the Portuguese service. Beresford therefore left Portugal and placed the question of the arrears of pay of his army before the king at Rio Janeiro. On his return the new Portuguese government refused to allow him to land, and he accordingly left for home. On arriving in England he turned his attention to politics, and strongly supported the duke of Wellington in the House of Lords. In 1823 his barony was made a viscountcy, and when the duke of Wellington formed his first cabinet in 1828 he gave Beresford the office of master-general of the ordnance. In 1830 Beresford retired from politics, and for some time subsequently he was occupied in a heated controversy with William Napier, the historian of the Peninsular War, who had severely criticised his tactics at Albuera. On this subject Wellington's opinion of Beresford is to the point. The duke of Wellington held Beresford to be a great general, but thought very highly of his powers of organisation and statesmanship, and went so far as to declare, during the Peninsular War, that, in the event of his own death, he would on this ground recommend Beresford to succeed him. The last years of Beresford's life were spent at Bedegbury, Kent, where he had purchased a country estate. He died on the 8th of January 1854.

BEREZINA, a river of Russia, in the government of Minsk, forming a tributary of the Dnieper. It rises in the marshes of Borizov and flows south, inclining to east, for 350 m. (250 m. navigable), for the most part through low-lying but well-wooded country. As a navigable river, and forming a portion of the canal system which unites the Black Sea with the Baltic, it is of importance for commerce, but is subject to severe floods. It was just above Borizov that Napoleon's army forced the passage of the Berezina, with enormous losses, on the 26th-28th of November 1812, during the retreat from Moscow.

BEREZOV, a town of Asiatic Russia, in the government of Tobolsk, 700 m. N. of the city of that name, situated on three hills on the left bank of the Ob, 26 m. above its mouth in the Ob, in 63° 55' N. lat. and 65° 7' E. long. It has more than once been destroyed by conflagrations—for example, in 1779, when it was burnt by Prince Menshikov, the favourite of Peter the Great and Catherine I., died here an exile, in 1729. In 1750 his enemy and rival, Prince Dolgoruki, was interned here with his family; and in 1742 General Ostermann was sent to Berezov with his wife and died there in 1747. The yearly mean temperature is 25° Fahr., the maximum cold being 47°. It has a cathedral, near which lies buried Mary Menshikov, once betrothed to the tsar Peter II., and some of the Dolgoruks. There is a trade in furs, mammoth bones, dried and salted fish. *Bp. (1807) 1073.*

BEREZOVSK, a town of Russia, in the government of Perm, on the eastern slope of the Urals, 8 m. N.E. of Ekaterinburg. It is the centre of an important gold-mining region (5 m. by 2) of the same name. The mines have been known since 1747. The inhabitants also manufacture boots, cut stone and carry on cabinet-making.

BERG (Ducatus Montensis), a former duchy of Germany, on the right bank of the Rhine, bounded N. by the duchy of Cleves, E. by the countyship of La Marck and the duchy of Westphalia, and S. and W. by the bishopric of Cologne. Its area was about 40 sq. m. The district was raised in 1108 to the rank of a countyship, but did not become a duchy till 1380, after it had passed into the possession of the Jülich family. In 1423 the duchy of Julich fell to Adolf of Berg, and in 1437 the countyship...
of Ravensberg was united to the duchies. The male line of the dukes of Jülich-Berg-Ravensberg became extinct in 1531, and the duchy passed by marriage to John III. (d. 1539), duke of Cleves and count of La Marck, whose male line became extinct with the death of John William, bishop of Münster, in 1609. Of the latter's four sisters, the eldest (Marie Eleonore) was married to Albert Frederick, duke of Prussia, the second (Anna) to Philip of Holstein (the future Duke of Holstein-Gottorp), the third to Maximilian of Bavaria, and the youngest, count palatine of Zweibrücken, and the fourth (Sybille) to Charles of Habsburg, margrave of Burgau. The question of the succession led to a prolonged contest, which was one of the causes of the Thirty Years' War. It was settled in 1614 by a partition, under which Berg, with Jülich, was assigned to the count palatine of Neuburg, in whose line it remained till 1742, when it passed to the Sulkzbach branch of the house of Wittelsbach. On the death of Charles Theodore, the last of this line, in 1799, Jülich and Berg fell to Maximilian Joseph of Zweibrücken (Maximilian I. of Bavaria), who ended the duchies in 1806 to Napoleon. Berg was bestowed by Napoleon, along with the duchy of Cleves and other possessions, on Joachim Murat, who bore the title of grand-duke of Berg; and after Murat's elevation to the throne of Naples, it was transferred to Louis, the son of the king of Holland. By the congress of Vienna in 1815 it was made over to Prussia.

BERGAMASK, or Bergomum (from the town of Bergamo in North Italy), a clumsy rustic dance (cf. Shakespeare, Midsummer Night's Dream, v. 360) copied from the natives of Bergamo, reputed to be very awkward in their manners.

BERGAMO (anc. Bergomum), a city and episcopal see of Lombardy, Italy, capital of the province of Bergamo, situated at the foot of the Alps, at the junction of the Brembo and Serio, 33° 3 m. N.E. of Milan by rail, and 26 m. direct. Pop. (1901) town, 25,142; commune, 46,861. The town consists of two distinct parts, the older Città Alta, upon a hill 1200 ft. above sea-level, strongly fortified by the Venetians, and the new town (Città Bassa) below, the two being connected by a funicular railway. The most interesting building of the former is the fine Romanesque church of S. Maria Maggiore, founded in 1137 and completed in 1355, with a baroque interior and some interesting works of art. Adjoining it to the north is the Cappella Colleoni, with a richly sculptured polychrome façade, and a modernized interior, containing the fine tombs of Bartolommeo Colleoni (c. 1400-1473), a native of Bergamo, and his daughter Medea. The work was executed in 1470-1476 by Giovanni Antonio Amadeo, who was also employed by the Venetians, and the town council. The town contains a city market-place (now Piazza Garibaldi) containing the Gothic Palace Vecchio or Broletto; close by are the cathedral (1614) and a small baptistery of 1340, rebuilt in 1808. The lower town contains an important picture-galley, consisting of three collections of works of northern Italian masters, one of which was bequeathed in 1891 by the art critic Giovanni Morelli. Bergamo has fine modern buildings and numerous silk and cotton factories. It also has a considerable cattle market, though its yearly Fiera di S. Alessandro (the patron saint) has lost some of its importance. Railways radiate from it to Lecco, Ponto della Selva, Usmate (for Monza or Seregno), Treviglio (on the main line from Milan to Verona and Venice) and (via Rovato) to Brescia, and steam tramways to Treviglio, Sarnico and Soncino.

The ancient Bergomum was the centre of the tribe of the Orobi; it became, after their subjection to Rome, a Roman municipality with a considerable territory, and after its destruction by Attila, became the capital of a Lombard duchy. From 1264 to 1428 it was under Milan, but then became Venetian, and remained so until 1797. Remains of the Roman city are not visible above ground, but various discoveries made are recorded by G. Mantovani in Not. Scien., 1843, pp. 257 onwards.

BERGAMOT, OIL OF, an essential oil obtained from the rind of the fruit of the Citrus bergamia. The bergamot is a small tree with leaves and flowers like the bitter orange, and a round fruit nearly 3 in. in diameter, having a thin lemon-yellow smooth rind. The tree is cultivated in southern Calabria, whence the entire supply of bergamot oil is drawn. Machinery is mostly used to express the oil from the fruit, which is gathered in November and December. The oil, which on standing deposits a stearoptene, bergamot camphor or Bergapten, is a limpid green-yellow fluid of specific gravity of c. 0-882 to 0-886. The latter's powerful but pleasant odour is mainly due to the presence of linalyl acetate, or bergamotol, which can be artificially prepared by heating linalol with acetic anhydride. The chief use of bergamot oil is in perfumery. The word apparently is derived from the Italian town Bergamo. The name Bergamot, for a variety of pear, is an entirely different word, supposed to be a corruption of the Turkish berg-armudi (= prince's pear; cf. Ger. Fürstenbier).
BERGEN-OP-ZOOM—BERGK

BERGEN ranks first of the Norwegian ship-owning centres, having risen to this position from fifth in 1870. The trade, however, is exceeded by that of Christiania. The staple export trade is in fish and their products; other exports are butter, copper ore and hides. The principal imports are coal, machinery, salt, grain and provisions. The manufactures are not extensive, but the preparation of fish products, shipbuilding, weaving and distillery, with manufactures of paper, pottery, tobacco and ropes are carried on. Bergen is an important centre of the extensive tourist traffic of Norway. Regular steamers serve the port from Hull and Newcastle (about 40 hours), from Hamburg, and from all the Norwegian coast towns. Many local steamers penetrate the fjords, touching at every village and gorge. Bergen is the nearest port to the famous Hardanger Fjord, and is the starting-point of a remarkable railway which runs through many tunnels and fine scenery towards Voss-vangen or Voss. In 1866 a beginning was made with the continuation of this line through the mountains to connect with Christiania. In the first 50 m. from Voss the line ascends 4080 ft., passing through a tunnel 5760 yds. long.

Bergen (formerly Bjørgvin) was founded by King Olaf Kyrre in 970-975, and rapidly grew to importance, the Byfjord becoming the scene of several important engagements in the course of various conflicts. The famous Hanseatic merchant maintained a falling position here from 1746.

The town suffered frequently from fire, as in 1702 and 1855, and the broad open spaces (Almenninge) which interrupt the streets are intended as a safeguard against the spread of flames.

See Y. Nielsen, Bergen fra de ældste tider indtil nutiden (Christiania, 1877); H. Jager, Bergen og Bergensere (Bergen, 1889).

BERGEN-OP-ZOOM, a town in the province of North Brabant, Holland, situated on both sides of the small river Zoom, near its confluence with the East Scheldt, 38 m. by rail E. by N. of Flushing. It is connected by a steamship service with Antwerp (20 m. S.) and with the islands of Tholen and Duiveland to the north-west. Pop. (1900) 13,663. The houses are well built, the market-places and squares handsome and spacious. It possesses a port and an arsenal, and contains a fine town hall, with portraits of the ancient margraves of Bergen-op-Zoom, a Latin school, and an academy of design and architecture. The remains of the old castle of the margraves have been converted into barracks. The tower is still standing and is remarkable for its increase in size as it rises, which causes it to rock in a strong wind. The church contains a monument to Lord Edward Bruce, killed in a duel with Lord Edward Sackville on the 1st of December 1613. There are numerous tile-works and potteries of fine ware; and a considerable trade is carried on in anchovies and oysters caught in the Scheldt. A large sugar-beet industry has also sprung up here in modern times.

Bergen-op-Zoom is a very old town, but little is known of its early history beyond the fact that it was taken by the Normans in 880. In the 11th century it became the seat of Count Gerhard of Wesemael, who surrounded it with walls and built a castle. By the end of the 13th century it had become one of the most prosperous towns of Holland on account of its fisheries and its cloth-trade. In 1576 the town joined the United Netherlands, and was shortly afterwards fortified. In 1588 it was successfully defended against the duke of Parma by an English and Dutch garrison commanded by Colonel Morgan, and in 1605 it was suddenly attacked by Du Tertul. In 1622 the Spaniards, under Spinola, made another attempt to take the town, but were forced to abandon the enterprise after a siege of ten weeks and the loss of 1200 men. Towards the end of the 17th century the fortifications were greatly strengthened by Coehorn, and in 1725 they were further extended. In 1747, however, the town was taken by the French, under Marshal Léopold, who surprised it by means of a subterranean passage. Restored at the end of the war, it was again taken by the French under Picquegru in 1795. The English, under Sir Thomas Graham, afterwards Lord Lynedoch, in March 1814 made an attempt to take it by a coup de main, but were driven back with great loss by the French, who surrendered the place, however, by the treaty of peace in the following May.

The lordship of Bergen-op-Zoom appears, after the definite union of the Low Countries with the Empire in 1814, as an hereditary fief of the Emperor, and BERGHAUS (1822-1850) may be traced from Henry (1068-1125), who also held Breda. In 1533 it was raised to a margravate by the emperor Charles V., and was held by various families until in 1790 it passed, through the Sultzbach branch of the Wittelsbachs, to the royal house of Bavaria, by whom it was renounced in favour of the Batavian republic in 1801.

BERGERAC, a town of south-western France, capital of an arrondissement in the department of Dordogne, on the right bank of the Dordogne, 60 m. E. of Bordeaux on the railway to Cahors. Pop. (1901) town, 16,645; commune, 15,533. The river is rendered navigable by a large dam and crossed by a fine bridge which leads to the suburb of La Madeleine. Apart from a few old houses in the older quarter by the river, the town contains no monuments of antiquarian interest. There is a handsome modern church built in the middle of the 17th century. Bergerac is the seat of a sub-prefect and has tribunals of first instance and of commerce and a communal college. Wine of fine quality is grown in the district and is the chief source of the commerce of the town, which is mainly carried on with Libourne and Bordeaux. There is a good trade in truffles, chestnuts, brandy and in the salmon of the Dordogne. The town has flour-mills, iron-works, tanneries, distilleries and nursery-gardens, and it has manufactures of casks and of vinegar. There are quarries of millstone in the vicinity. In the 16th century Bergerac was a very flourishing and populous place, but most of its inhabitants having embraced Calvinism it suffered greatly during the religious wars and by the revocation of the edict of Nantes (1685).

It was in 1577 the scene of the signing of the sixth peace between the Catholics and Protestants. Its fortifications and citadel were demolished by Louis XIII in 1626.

BERGHAUS, HEINRICH (1702-1884). German geographer, was born at Kleve on the 3rd of May 1702. He was trained as a surveyor, and after volunteering for active service under General Tavenzien in 1813, joined the staff of the Prussian trigonometrical survey in 1816. He carried on a geographical school at Potsdam in company with Heinrich Lange, August Petermann, and others, and long held the professorship of applied mathematics at the Bauakademie. But he is most famous in connexion with his cartographical work. His greatest achievement was the Physikalischer Atlas (Gottha, 1838-1849), in which work, as in theיבורק, and in the other works of this date, he was closely associated with him. He also had a share in the re-issue of the great Stieler Handatlas (originally produced by Adolf Stieler in 1817-1823), and in the production of other atlases. His written works were numerous and important, including Allgemeine Länder- und Völkerkunde (Stuttgart, 1837-1840), Grundriss der Geographie in fünf Büchern (Berlin, 1842), Die Völker des Erdballs (Leipzig, 1845-1847), Was man von der Erde weiß (Berlin, 1856-1860), and various large works on Germany. In 1863 he published Briefwechsel mit Alexander von Humboldt (Leipzig). He died at Steitten on the 17th of February 1884.

BERGK, THEODOR (1812-1881), German philologist, was born at Leipzig on the 22nd of May 1812. After studying at the university of his native town, where he profited by the instruction of G. Hermann, he was appointed in 1835 to the lectureship in Latin at the orphan school at Halle. After holding posts at Neustrelitz, Berlin and Cassel, he succeeded (1842) K. F. Hermann as professor of classical literature at Marburg. In 1852 he went to Freiburg, and in 1857 returned to Halle. In 1868 he resigned his professorship, and settled down to study and literary work in Bonn. He died on the 20th of July 1881, at Regaz in Switzerland, where he had gone for the benefit of his health. Bergk's literary activity was very great, but his reputation mainly rests upon his work in connexion with Greek literature and the Greek lyric poets. His Poetae Lyrici Graeci (1843, 5th ed. 1900, &c.), and Griechische Literaturgeschichte (1872-1887, completed by G. Hinrichs and R. Peppmüller) are standard
works. He also edited Anacreon (1834), the fragments of Aristophanes (1840), Aristophanes (3rd ed., 1872), Sophocles (2nd ed., 1868), a lyric anthology (4th ed., 1890). Among his other works may be mentioned: Augusti Rerum a se gestarum Index (1873?); Inschriften römischer Schleudergesche (1876); Zur Geschichte und Topographie der Rheinlande in römischer Zeit (1879). His Beiträge zur Pamaphigie (1882).

His Kleine philologische Schriften have been edited by Peppmüller (1884–1886), and contain, in addition to a complete list of his writings, a sketch of his life. See Sandys, Hist. of Class. Schlo. iii. 146 (1908).

BERGLER, STEPHANIE, (1686–1733), was born at Kronstadt in Transylvania. The date of his death is uncertain. After studying at Leipzig, he went to Amsterdam, where he edited Homer and the Oenonomus of Julius Pollus for Wetzstein the publisher. Subsequently, at Hamburg, he assisted the great bibliographer J. A. Fabricius in the production of his Bibliotheca Graeca and his edition of Sextus Empiricus. He finally found a permanent post in Bucharest as secretary to the prince of Walachia, Alexander Mavrocordato, whose work Il ple tavo vapidhov (De Officis) he had previously translated for Fritzsch, the Leipzig bookseller, who had been empress of poetry and literary hack. In the prince's library Bergler discovered the introduction and the first three chapters of Eusebius's Demonstratio Evangelica. He died in Bucharest, and was buried at his patron's expense. According to another account, Bergler, finding himself without means, drifted to Constantinople, where he came to an untoward end (c. 1740). He is said to have become a convert to Islam; this report was probably a mistake for the undisputed fact that he embraced Roman Catholicism. Bergler led a wild and irregular life, and offended his friends and made many enemies by his dissipated habits and cynical disposition. In addition to writing numerous articles for the Leipzig Acta Eruditorum, Bergler edited the edito princeps of the Byzantine historiographer Genesis (1733), and the letters of Aleiphron (1715), in which seventy-five hitherto unpublished letters were for the first time included.

BERGMAN, TOBERN OLOF (1735–1784), Swedish chemist and naturalist, was born at Katrineberg, Vastergotland, Sweden, on the 20th of March 1735. At the age of seventeen he entered the university of Upsala. His father wished him to read either law or divinity, while he himself was anxious to study mathematics and natural science; in the effort to please both himself and his father he overworked himself and injured his health. During a period of enforced abstinence from study, he amused himself with field botany and entomology, to such good purpose that he was able to send Linnaeus specimens of several new kinds of insects, and in 1756 he succeeded in proving that, contrary to the opinion of that naturalist, Coccus coxaci was really the ovum of a kind of leech. In 1758, having returned to Upsala, he graduated there, and soon afterwards began to teach mathematics and physics at the university, publishing papers on the rainbow, the aurora, the pyrotechnic phenomena of tourmaline, &c.

In 1767 Johann Gottschalk Wallerius (1705–1758) having resigned the chair of chemistry and miningology, Bergman determined to become a candidate, though he had paid no particular attention to chemistry. As evidence of his attainments he produced a memoir on the manufacture of alum, but his pretensions were strongly opposed, and it was only through the influence of Gustavus III., then crown prince and chancellor of the university, that he gained the appointment, which he held till the end of his life. He died at Medovi on Lake Vetter on the 9th of July 1784. Bergman's most important chemical work is his Enquiries and Essay on Chemical Affinity (1775), a study of chemical affinity. In methods of chemical analysis, both by the blowpipe and in the wet way, he effected many improvements, and he made considerable contributions to mineralogical and geological chemistry, and to crystallography. He also made observations of the transit of Venus in 1761, and published a Physical Description of the Earth in 1766.

His works were collected and printed in 6 vols. as Opuscula Physica et Chemica in 1779–1799, and were translated into French, German and English.

BERGSCHRUND (Ger. Berg, mountain; Schruad, cleft or crevice), a gaping crack in the upper part of a snowfield or glacier, near the rock wall, caused by the glacier moving bodily away from the mountain-side as the mass settles downwards. The crack is roughly parallel to the rock-face of the upper edge of the glacier basin and extends downwards to the solid rock beneath the glacier where at the bottom of this huge crevass there are blocks of ice, and large pieces of rock torn off by the lower portion of the glacier from the rock wall and floor.

BERGUES, a town of northern France, in the department of Nord, at the junction of the canal of the Colme with canals to Dunkirk and Furnes (in Belgium), 5 m. S.S.E. of Dunkirk by rail. Pop. (1906) 4499. The town has a belfry, the finest in French Flanders, dating from the middle of the 16th century and restored in 1767. The church of St Ours is a brick building of the 17th century in the Gothic style with a modern façade. The town hall, dating from the latter half of the 19th century, contains a municipal library and an interesting collection of pictures. The industries of the town include brewing and malting, and the manufacture of brushes and oil.

BERHAMPUR, a town of British India, the headquarters of Murshidabad district, in Bengal, situated on the left bank of the river Bhagirathi, 5 m. below Murshidabad city. Pop. (1901) 24,397. Berhampur was fixed upon as the site of the chief European station for Bengal; and a square of brick barracks was erected in 1767, at a cost of £5,000. Here was committed the first overt act of the mutiny, on the 25th of February 1857. No troops are now stationed here, and the barracks have been utilized for a jail, a lunatic asylum and other civic buildings. A college, founded by government in 1853, was made over in 1888 to a local committee, being mainly supported by the munificence of the rani Svanamayi. In the municipality of Berhampur is included the remnant of the once important, but now utterly decayed city ofコストbazar (p.e.).

BERHAMPUR, a town of British India, in the presidency of Madras. Pop. (1901) 25,720. It is the headquarters of Ganjam district, and is situated about 9 m. from the sea. It is a station on the East Coast railway, which connects Calcutta with Madras. Berhampur had a military cantonment, sometimes distinguished as Baupur, containing a wing of a native regiment; but the troops have been transferred elsewhere. There is some weaving of silk cloth, and export trade in sugar. The college, originally founded by government, is now maintained by the raja of Kallikota. Silk-weaving and sugar-manufacture are carried on.

BERI-BERI, a tropical disease of the greatest antiquity, and known to the Chinese from an extremely remote period. It gradually dropped out of sight of European practice, until an epidemic in Brazil in 1863, and the opening up of Japan, where it prevailed extensively, and the investigations into the disease in Borneo, brought it again into notice. The researches of Scheube and Bälz in Japan, and of Pekelharing and Winkler in the Dutch Indies, led to its description as a form of peripheral neuritis (see also NEUROPATHOLOGY). The geographical distribution of beri-beri is between 4° N. and 15° S. It occurs in Japan, Korea and on the Chinese coast south of Shanghai; in Manila, Hongkong, Cochin China, Burma, Singapore, Malacca, Java and the neighbouring islands; also in Ceylon, Mauritius, Madagascar and the east coast of Africa. In the Western hemisphere it is found in Cuba, Panama, Venezuela and South America. It has been carried in ships to Australia and to England. Sir P. Manson has "known it originate in the port of London in the crews of ships which had been in harbour for several months," and he suggests that when peripheral neuritis occurs in epidemic form it is probably beri-beri. The disease is believed by many authorities to be an infective agent of a parasitic nature, but attempts to identify it have not been entirely successful. It is "not obviously communicable from person to person" (Manson), but may be carried from...
place to place. It clings to particular localities, buildings and ships, in which it has a great tendency to occur; for instance, it is apt to break out again and again on certain vessels trading to the East. It haunts low-lying districts along the coast, and the banks of rivers. Moisture and high temperature are required to develop its activity, which is further favored by bad ventilation, overcrowding and underfeeding. Another strongly supported hypothesis is that it is caused by an unwholesome diet. The experience of the Japanese navy points strongly in this direction. Beri-beri was constantly prevalent among the sailors until 1884, when the dietary was changed. A striking and progressive diminution at once set in, and continued until the disease wholly disappeared. Major Ronald Ross suggested that beri-beri was really arsenical poisoning. A natural surmise is that it is due to some fungoid growth affecting grain, such as rice, maize or some other food stuff commonly used in the localities where beri-beri is prevalent, and among sailors. The conditions under which their food is kept on board certain ships might explain the tendency of the disease to haunt particular vessels. Dr Charles Hose is the principal advocate of this theory. Having had much experience of beri-beri in Sarawak, he associates it with the eating of muddy rice, a germ in the fungus constituting the poison. But Dr Hose’s views as to rice have been strongly opposed by Dr Hamilton Wright and others.

The most susceptible age is from 15 to 40. Children under 15 and persons over 50 or 60 are rarely attacked. Men are more liable than women. The Race has no influence. Previous attacks possibly predispose.

The symptoms are mainly those of peripheral neuritis with special implication of the phrenic and the pneumogastric nerves. There is usually a premonitory stage, in which the patient is languid, easily tired, depressed, and complains of numbness, stiffness and cramps in the legs; the ankles are oedematous and the face is puffy. After this, pronounced symptoms set in rapidly, the patient suddenly loses power in the legs and is hardly able to walk or stand; this paresis is accompanied by partial anaesthesia, and by burning or tingling sensations, particularly in the feet, legs and arms; the finger and toe nails are thickened, and the calf muscles tender. These symptoms increase; the oedema becomes general, the paralysis more marked; breathlessness and palpitation come on in paroxysms; the urine is greatly diminished. There is no fever, unless it is of an incidental character, and no brain symptoms arise. The patient may remain in this condition for several days or weeks, when the symptoms begin to subside. On the disappearance of the oedema the muscles of the legs are found to be atrophied. Recovery is very slow, but appears to be certain when once begun. When death occurs it is usually from syncope through over-distension of the heart. The mortality varies greatly, from 2 to 50% of the cases. The disease is said to be extremely fatal among the Malays. After death there is found to be serious infiltration into all the tissues, and often haemorrhages into the muscles and nerves, but the most important lesion is degeneration of the peripheral nerves. The cerebrospinal centres are not affected, and the degeneration of the nerve fibres is more marked the farther they are from the point of origin. The implication of the phrenic and pneumogastric nerves, and of the cardiac plexus, accounts for the breathlessness, palpitation and heart failure; that of the vaso-motor system for the oedema and diminution of urine, and that of the spinal nerves for the loss of power, the impairment and perversion of sensation. According as these nerves are variously affected the symptoms will be modified, some being more prominent in one case and some in another.

Authorities.—See Sir Patrick Manson, Tropical Diseases (new ed., 1907); for a critical discussion of the subject, see The Times of 28th October 1905; a full bibliography is given by Manson in Allbutt and Rolleston’s System of Medicine (1907).

BERING (Beréing), VITUS (1680–1741), Danish navigator, was born in 1680 at Horsens. In 1703 he entered the Russian navy, and served in the Swedish war. A series of explorations of the north coast of Asia, the outcome of a far-reaching plan devised by Peter the Great, led up to Bering’s first voyage to Kamchatka. In 1725, under the auspices of the Russian government, he went overland to Okhotsk, crossed to Kamchatka, and built the ship “Gabriel.” In her he pushed northward in 1728, until he could no longer observe any extension of the land to the north, or its appearance to the east. In the following year he made an abortive search for land eastward, and in 1730 returned to St Petersburg. He was subsequently commissioned to a further expedition, and in 1740 established the settlement of Petropavlovsk in Kamchatka; and built two vessels, the “St Peter” and “St Paul,” in which in 1741 he led an expedition towards America. A storm separated the ships, but Bering sighted the southern coast of Alaska, and a landing was made at Kayak Island or in the vicinity. Bering was forced by adverse conditions to return quickly, and discovered some of the Aleutian Islands on his way back. He was afflicted with scurvy, and became too ill to command his ships, which were at last driven to refuge on an uninhabited island in the south-west of Bering Sea, where Bering himself and many of his company died. This island bears his name. Bering died on the 10th of December 1741. It was long before the value of his work was recognized; but Captain Cook was able to prove his accuracy as an observer.

See G. F. Müller, Sammlung russischer Geschichten, vol. iii. (St Petersburg, 1758); P. Lauridsen, Bering og de Russiske Opdagelsesrejser (Copenhagen, 1885).

BERING ISLAND, SEA, AND STRAIT. These take their name from the explorer Vitus Bering. The island (also called Avatcha), which was the scene of his death, lies in the south-western part of the sea, off the coast of Kamchatka, being one of the Commander or Komandor group, belonging to Russia.

It is 60 m. long and 28 m. in extreme breadth; the area is 615 sq. m. The extreme elevation is about 300 ft. The smaller Copper Island lies near. The islands are treeless, and the climate is severe, but there is a population of about 650. Bering Sea is the northward continuation of the Pacific Ocean, from which it is demarcated by the long chain of the Aleutian Islands. It is bounded on the east by Alaska, and on the west by the Siberian and Kamchatkan coast. Its area is estimated at 570,000 sq. m. In the north and east it has numerous islands (St Lawrence, St Matthew, Nunivak and the Pribiloff group) and is shallow; in the south-west it reaches depths over 2000 fathoms. The seal-fisheries are important (see Bering Sea Arbitration). The sea is connected with the Arctic Ocean northward by Bering Strait, at the narrowest part of which East Cape (Deshnev) in Asia approaches within about 36 m. of Cape Prince of Wales on the American shore. North and south of these points the coasts on both sides rapidly diverge. They are steep and rocky, and considerably indented. The extreme depth of the strait approaches 50 fathoms, and it contains two small islands known as the Diomedes Islands. These granite domes, lacking a harbour, lie about a mile apart, and the boundary line between the possessions of Russia and the United States passes between them. They are occupied by a small tribe of about 80 Eskimo, who have
BERING SEA ARBITRATION.

The important fishery dispute between Great Britain and the United States, which was closed by this arbitration, arose in the following circumstances.

In the year 1867 the United States government had purchased from Russia all her territorial rights in Alaska and the adjacent islands. The boundary between the two powers, as laid down by the treaty for purchase, was thereafter drawn from the middle of Bering Strait south-west to a point midway between the Aleutian and Komandorski Islands dividing Bering Sea into two parts, of which the larger was on the American side of this line. This portion included the Pribilof Islands, which are the principal breeding-grounds of the seals frequenting those seas. By certain acts of congress, passed between 1868 and 1873, the killing of seals was prohibited upon the islands of the Pribilof group in "the waters adjacent thereto" except upon certain specified conditions. No definition of the meaning of the words "adjacent waters" was given in the act. In 1876 the exclusive rights of killing seals were granted to the United States and the United States were authorized to cede to the United States to the Alaska Commercial Company, upon conditions limiting the numbers to be taken annually, and otherwise providing for their protection. As early as 1872 the operations of foreign sealers attracted the attention of the United States government, but any precautions then taken seem to have been directed against the capture of seals on their way through the passages between the Aleutian Islands, and no claim to jurisdiction beyond the three-mile limit appears to have been put forward. On the 12th of March 1881, however, the acting secretary of the United States, Mr. Sedgwick, in a letter addressed to the British consul in Seattle, asking for an interpretation of the words "waters adjacent thereto" in the acts of 1868 and 1873, stated that all the waters east of the boundary line were considered to be within the waters of Alaska territory. In March 1886 this letter was communicated to the San Francisco customs by Mr Daniel Manning, secretary of the treasury, for publication. In the same summer three British sealers, the "Carolina," "Onward" and "Thornton," were captured by an American revenue cutter 50 m. from land. They were condemned by the district judge on the express ground that they had been sealing within the limits of Alaska territory. Diplomatic representations followed, and an order for release was issued, but in 1887 further captures were made and were judicially supported upon the same grounds. The respective positions taken up by the two governments in the controversy which ensued may be thus indicated. The United States claimed as a matter of right an exclusive jurisdiction over the sealing industry in Bering Sea; they also contended that the protection of the fur seal was, upon grounds both of morality and interest, an international duty, and should be secured by international arrangement. The British government repudiated the American rights, but was largely dependent upon the question of international regulation. Between 1887 and 1890 negotiations were carried on between Russia, Great Britain and the United States with a view to a joint convention. Unfortunately the parties were unable to agree as to the principles upon which regulation should be based. The negotiations were wrecked upon the question of pelagic sealing. The only seal nurseries were upon the Pribilof Islands, which belonged to the United States, and the Komandorski group, which belonged to Russia. Consequently to prohibit pelagic sealing would have been to exclude Canada from the industry. The United States, nevertheless, insisted that such prohibition was indispensable on the grounds—(1) that pelagic sealing involved the destruction of breeding stock, because it was practically impossible to distinguish between the male and female seal when in the water; (2) that it was unnecessarily wasteful, inasmuch as a large proportion of the seals so killed were lost. On the other hand, it was contended by Great Britain that in all known cases the extermination of seals had been the result of operations upon land, and had never been caused by sealing exclusively pelagic. The claim that Bering Sea was more crucial was abandoned, but it was asserted that Russia had formerly exercised therein rights of exclusive jurisdiction which had passed to the United States, and they relied inter alia upon the ukase of 1821, by which foreign vessels had been forbidden to approach within 100 Italian miles of the coasts of Russian America. It was pointed out by Great Britain that this ukase had been the subject of protest both by Great Britain and the United States, and that by treaties similar in their terms, made between Russia and each of the protesting powers, Russia had agreed that their subjects, should not be troubled or molested in navigating or fishing in any part of the Pacific Ocean. The claims of Russia were withdrawn, but it was contended that the United States did not include Bering Sea. They also claimed an interest in the fur seals, involving the right to protect them outside the three-mile limit. In August 1890 Lord Salisbury proposed that the question at issue should be submitted to arbitration. This was ultimately assented to by the secretary of state, James Gillespie Blaine, on the understanding that certain specific points, which he indicated, should be laid before the arbitrators. On the 29th of February 1892 a definitive treaty was signed at Washington. Each power was to name two arbitrators, and the third was to be appointed by the arbitrators. The arbitrators of Norway and Sweden were each to name one. The points submitted were as follows:—(1) What exclusive jurisdiction in the sea now known as Bering Sea, and what exclusive rights in the seal fisheries therein, did Russia assert and exercise prior to and up to the time of the cession of Alaska to the United States? (2) How far were her claims of jurisdiction as to the seal fisheries recognized and conceded by Great Britain? (3) Was the body of water now known as Bering Sea included in the phrase "Pacific Ocean," as used in the treaty of 1825 between Great Britain and Russia, and what rights, if any, in Bering Sea were held exclusively exercised by Russia? (4) Did not all the rights of Russia as to jurisdiction and as to the seal fisheries in Bering Sea east of the water boundary, in the treaty between the United States and Russia of the 30th of
BERIOT—BERKELEY FAMILY

March 1867, pass unimpaired to the United States under that treaty? (5) Had the United States any and what right of protection over, or property in, the fur seals frequenting the islands of Bering Sea when such seals are found outside the three-mile limit? In the event of a determination in favour of Great Britain the arbitrators were to determine what concurrent regulations were necessary for the preservation of the seals, and a joint commission was to be appointed by the two powers to assist them in the investigation of the facts of seal life. The question of damages was reserved for further discussion. In this way liberty was given to the arbitrators to determine any question of fact to suit their purpose, and to ask for a finding thereon. The tribunal was to sit at Paris. The treaty was approved by the Senate on the 29th of March 1892, and ratified by the president on the 22nd of April.

The United States appointed as arbitrator Mr John M. Harlan, a justice of the Supreme Court, and Mr John T. Morgan, a member of the Senate. The British arbitrators were Lord Hannen and Sir John Thompson. The neutral arbitrators were the baron de Courcel, the marquis Visconti Venosta, and Mr Gregor von Gutmann appointed respectively by the president of the French Republic, the king of Italy, and the king of Norway and Sweden. The sittings of the tribunal began in February and ended in August 1893. The main interest of the proceedings lies in the second of the two claims put forward on behalf of the United States. This claim cannot easily be stated in language of precision; it is indicated rather than formulated in the last of the five points specially submitted by the treaty. But its general character may be gathered from the arguments addressed to the tribunal. It was suggested that the seals had some of the characteristics of the domestic animals, and could therefore be the subject of something in the nature of a right of property. They were so far amenable to human control that it was possible to take their increase without destroying the stock. Sealing upon land was legitimate sealing; the United States being the owners of the land, the industry was a trust vested in them for the benefit of mankind. On the other hand, pelagic sealing, being a method of promiscuous slaughter, was illegitimate; it was contra bonos mores and analogous to piracy. Consequently the United States claimed a right to restrain such practices, both as proprietors of the seals and as proprietors and trustees of the natural history of the industry. It is obvious that such a claim is a novelty hitherto unrecognized by any system of law. Mr J. C. Carter, therefore, as counsel for the United States, submitted a theory of international jurisprudence which was equally novel. He argued that the determination of the tribunal must be grounded upon the "principles of right," that the "by the rule or principle of right was meant a moral rule dictated by the general standard of justice among which civilized nations are agreed, that this international standard of justice is but another name for international law, that the particular recognized rules were but cases of the application of a more general rule, and that where the particular rules were silent the general rule applied." The practical result of giving effect to this contention would be that an international tribunal could make new law and apply it retrospectively. Mr Carter's contention was successfully combated by Sir Charles Russell, the leading counsel for Great Britain.

The award, which was signed and published on the 15th of August 1893, was in favour of Great Britain on all points. The question of damages, which had been reserved, was ultimately settled by a mixed commission appointed by the two powers in February 1896, the total amount awarded to the British sealers being $731,511.66.

BERIO, CHARLES AUGUSTE DE (1802-1879), Belgian violinist and composer. Although not definitely a pupil of Viotti or Baillot he was much influenced by both. He was very successful in his concert tours, and held appointments at the courts of Belgium and France. From 1843 to 1852 he was violin professor at the Brussels conservatoire. Then his eyesight began to fail, and in 1858 he became blind. His compositions are still often played, and are good, clear displays of technique.

BERJA, a town of southern Spain, in the province of Almería, on the south-eastern slope of the Sierra de Gádor, 10 m. N.E. of Adra by road. Pop. (1900) 13,224. Despite the lack of a railway Berja has a considerable trade. Lead is obtained among the mountains, and the more sheltered valleys produce grain, wine, oil, fruit and esparto grass. These, with the paper, linen and cotton goods manufactured locally in small quantities, are exported from Adra.

BERKA, a town and watering-place of Germany, in the grand-duchy of Saxe-Weimar, on the Ilm and the Weimar-Kranichfeld railway (50 m. S.E. of Weimar). It has hot springs, which are largely frequented in the summer. Berka was once celebrated for its Cistercian nunnery, founded in 1251. Two m. down the Ilm is the curious castle of Burgforth, partly hewn out of the solid rock.

BERKELEY, the name of an ancient English family remarkable for its long tenure of the feudal castle built by the water of Severn upon the lands from which the family takes its name. It traces an undoubted descent from Robert (d. 1170) son of Harding. Old pedigree-makers from the 14th century onward have made of Harding and his younger son a king of Denmark and a companion of the Conqueror, while modern historians assert his identity with one Harding who, although an English thane, is recorded by Domesday Book in 1086 as a great landowner in Somerset. This Harding the thane was son of Elnod or Alnod, who is recognized as Eadnoth the Staller, slain in beating off the sons of Harold when they attacked his county. But if Harding the Berkeley ancestor be the Harding who, as the queen's butler, witnesses King Edward's Waltham charter of 1062, his dates seem strangely apart from those of Robert his son, dead a hundred and eight years later. Of Robert fitz Harding we know that he was a Bristol man whose wealth and importance were probably increased by the trade of the port. A partisan of Henry, son of the empress, that prince before his accession to the throne granted him, by his charter at Bristol in the earlier half of 1153, the Gloucestershire manor of Bitton, and a hundred librales of land in the manor of Berkeley, Henry agreeing to strengthen the castle of Berkeley, which was evidently already in Robert's hands. In his rhyed chronicle Robert of Gloucester tells how—

"A bourgeois at Bristowe—Robert Harding Votry who treasured and richener son of the king That he got him and is eis—the noble baronie That so riche is of Berkele—mid al the seignorie."

Later in the same year the duke of Normandy granted to Robert fitz Harding Berkeley manor and the appurtenant district called "Berkelsaihernesse," to hold in fee by the service of one knight or at a rent of 100 s. Being at Berkeley, the duke confirmed to Robert a grant of Bedminster made by Robert, earl of Gloucester, and in the first year of his reign as king of England he confirmed his own earlier grant of the Berkeley manor. About this time Robert, who had founded St Augustine's Priory in Bristol, gave to the Black Canons there the five churches in Berkeley and Berkeley Herness. In their priory church he was buried in 1170, Berkeley descending to his son and heir Maurice. Berkeley had already given a surname to an earlier family sprung from Roger, its Domesday tenant, whose descendants seem to have been ousted by the partisan of the Angevin. But if there had been a feud between the families it was ended by a double alliance, a covenant having been made at Bristol about November 1153 in the presence of Henry, duke of Normandy, whereby Maurice, son of Robert fitz Harding, was to marry the daughter of Roger Berkeley, Roger's own son Roger marrying the daughter of Robert. In his charters of 1160 Robert tells the king that, although he owes the service of five knights for Berkeley, Roger of Berkeley still holds certain lands of the honour for which he does no service to Robert. This elder line of Berkeley survived for more than two centuries on their lands of Dursley and Cubberley, but after his father's death Maurice, son of Robert, is styled Maurice of Berkeley. Robert of Berkeley, the eldest son of Maurice, paid in 1190 the vast sum of £1000 for lively of his great inheritance, but, rising with the rebellious
BERKELEY FAMILY

Barons against King John, his castle was taken into the king's hands. Seizin, however, was granted in 1220 to Thomas his brother and heir, but the estate was again forfeit in the next generation for a new defection, although the wind of the royal displeasure was tempered by the fact that Isabel de Creoun, wife of Maurice, lord of Berkeley, was the king's near kinswoman. Thomas, son of Maurice, was allowed to succeed his father in the lands, and, having a writ of summons to parliament in 1205, he is reckoned the first hereditary baron of the line.

Even in the age of chivalry the lords of Berkeley were notable warriors. One of these, who as a lad had ridden on the barons' side at Evesham, followed the king's wars for half a century of his long life, flying at Falkirk and at Bannockburn, in which fight he was taken by the Scots. His seal of arms is among those attached to the famous letter of remonstrance addressed by the barons of England to Pope Boniface VIII.

Maurice, his son, joined the confederation against the two Despensers, and lay in prison at Wallingford until his death in 1326, the queen's party gaining the upper hand too late to release him. But as the queen passed by Berkeley on her way to seize Bristol, she left back the castle, which had been held by Maurice. The king seized Maurice, as well as his brother, John. These were treated after the capture of the castle and the victualing of it. The chronicler agrees that Thomas Berkeley had no part in the murder of the king, whom he treated kindly. It was then when Thomas was away from the castle that Mautravers and Gournay made an end of their charge. Through the providence of this Thomas the Berkeley estates were saved to the male line of his house, a fine levied in the twenty-third year of Edward III. settling them. Thomas of Berkeley fought at Crecy and Poitiers, bringing six knights and thirty-two squires with him. He was captured by the king's ransom, raised for the first time on the day of Poitiers, rode after a flying Picard squire, by whom he was grievously wounded and held to ransom. Gournay etrs in describing this knight as Thomas, lord of Berkeley, for the covenant made in 1360 for the release of Maurice is still among the Berkeley muniments, the ransom being stated at £1,000.

Being by his mother a nephew of Roger Mortimer, earl of March, the paramour of Queen Isabel, Maurice Berkeley married Elizabeth, daughter of Hugh Despenser, the younger of Edward II.'s favourites and the intruder in Berkeley Castle. With his son and heir Thomas of Berkeley, one of the commissioners of parliament for the deposing of Richard II. and a warden of the Welsh marchers who harried Owen of Glendower, the direct male line of Robert Fitz Hardinge failed, but for the settlement of the estates Berkeley would have passed from the family. On this Thomas's death in 1417 Elizabeth, his daughter and heir, and her husband, Richard Beauchamp, earl of Warwick, the famous traveller, statesman and joustor, seized Berkeley Castle. Earl and countess only withdrew after James Berkeley, the nephew and heir male, had lived on his lands by the purchased aid of Humphrey of Gloucester. But the Beauchamps returned more than once to vain attacks on the stout walls of Berkeley, and a quarrel of two generations ended with the pitched battle of Nibley Green. Fought between the retainers of William, lord Berkeley, son of James, and those who followed Thomas Talbot, viscount Lisle, grandson of the illustrious Talbot and great-grandson of the countes of Warwick, this was the last private battle on English ground between two feudal lords. Young Lisle was shot under the beaver by an arrow, and the feud ended with his death, all claims of his widow being settled with an annuity of £60. Bitter as was the long quarrel, it kept the Berkeleys from casting their interest into the Wars of the Roses, in which most of their fellows of the ancient baronage sank and disappeared.

The victorious Lord Berkeley, whose children died young, was on ill terms with his next brother, and made havoc of the great Berkeley estates by grants to the Crown and the royal house, for which he was rewarded with certain empty titles. Edward IV. gave him a viscount's patent in 1481, and Richard III. created him earl of Nottingham in 1483. His compliance extending to the new dynasty, Henry VII. made him earl marshal in 1485 and marquis of Berkeley in 1487. For this last patent he, by a settlement following a recovery suffered, gave the king and his heirs male Berkeley Castle and all that remained to him of his ancestors' lands, enjoying for his two remaining years a bare life interest. At his death in 1491 the king took possession, bringing his queen with him on a visit to Berkeley.

He follows a chapter in the history of the Berkeley peerage. When Thomas, Lord Berkeley, died in 1417, it might have been presumed that his dignity would descend to his heir, the countess of Warwick. Nevertheless, his nephew and heir male was summoned as a baron from 1421, apparently by reason of his tenure of the castle and its lands. When the marquess of Berkeley was dead without surviving issue, the castle having passed to the crown, Maurice, the brother and heir, had no summons. Yet this Maurice's son, another Maurice, had a summons as a baron, although not with the room in the peerage which Berkeley was due to inherit. The old precedent was restored when Thomas, brother and heir of this baron, was summoned. This Thomas, who had a command at Flodden, held his ancestors' castle as constable for the king. A final remainder under the marquess's settlement brought back castle and lands on the failure in 1553 of the heirs male of the body of Henry VII., and Henry, Lord Berkeley, had special livery of them in his minority. Yet although seized of the castle he took a lower seat in the parliament house than did his grandfather who was not so seized, being given place after Abercarn, Audley and Strange.

By these things we may see that peerage law in old time rested upon the pleasure of the sovereign and upon no ascertained and unvarying custom. Of the power behind that pleasure this Henry, Lord Berkeley, had one sharp reminder. He was, like most of his line, a keen sportsman, and returning to Berkeley to find that a royal visit had made great slaughter among his deer, he showed his resentment by disparking Berkeley Park. Thereat Queen Elizabeth sent him a warning in round Tudor fashion. Let him beware, she wrote, for the earl of Leicester coveted the castle by the Southern.

At the Restoration, George, Lord Berkeley, who had been one of the commissioners to invite Charles II.'s return from the Hague, petitioned for a higher place in parliament, claiming a barony by right of tenure before 1205, but his claim was silenced by his advancement on September 11, 1679, to be viscount of Durley and earl of Berkeley. James, the 3rd earl, an active sea captain who was all but lost in company with Sir Cloudesley Shovel, became knight of the Garter and lord high admiral and commander-in-chief in the Channel, and his house being loyal supporters of the Hanoverian dynasty.

The last and most curious chapter of the history of the Berkeley honours was opened by Frederick Augustus, the 5th earl of Berkeley (1745-1810). This peer married at Lambeth, on the 10th of May 1766, one Mary Cole, the daughter of a small tradesman at Wotton-under-Edge, with whom he had already lived for several years, several children having been born to them. In order to legitimize the issue born before the marriage, the earl in 1801 made declaration of an earlier marriage contracted privately at Berkeley in 1785. On his death in 1811 the validity of this alleged marriage was tested by the committee of privileges of the House of Lords, and it was shown without doubt that the evidence for it, a parish register entry, was a forgery.

Under the will of his father, Colonel William Berkeley, the eldest illegitimate son, had the castle and estates, and on the failure of his claim to the earldom he demanded a writ of summons as a baron by reason of his tenure of the castle. No judgment was given in the matter, the king in council having declared in 1669 that baronies by tenure were “not in being and so not fit to be revived.” But Colonel Berkeley's political influence afterwards procured him (1831) a peerage as Lord Segrave of
BERKELEY, BISHOP

779

Berkeley, and ten years later an earldom with the title of Fitzhardinge. He died without issue in 1857. His brother, Sir Maurice Fitzhardinge Berkeley, who succeeded to Berkeley under the terms of the 5th earl’s will, revived the claims, and was likewise given a new barony (1861) as Lord Fitzhardinge, a title in which he was succeeded by two of his sons, the 3rd baron (b. 1856) being in 1909 owner of the Berkeley and Cranford estates. The earldom of Berkeley was never assumed by the eldest legitimate son of the 4th earl, and in 1909 enjoyed by Royal, Thomas Moreby Berkeley, 6th, 6th, grandson, of Admiral Sir George Cranfield Berkeley, second son of the 6th earl. Berkeley, claimed the barony of Botetourt and had a summons in 1764, dying without issue in 1770. Sir Maurice Berkeley of Bruton, a cadet of Stoke Giffard, was forefather of the Viscounts Fitzhardinge, the Lords Berkeley of Stratton (1658–1773) and the earls of Falmouth, all extinct, the Berkeleys of Stratton bequeathing their great London estate, including Berkeley Square and Stratton Street, to the main line. Edward Berkeley of Pylle in Somerset, head of a cadet line of the Bruton family, married Philippa Speke, whose mother was Joan, daughter of Sir John Portman of Orchard Portman, baronet. His grandson William, on succeeding to the Orchard Portman and Bryanston estates, took the additional name of Portman, and from him come the Viscounts Portman of Bryanston (1875). From James, Lord Berkeley, who died in 1466, descended Rowland Berkeley, a clothier of Worcester, who bought the estates of Spetchley. Rowland’s second son, Sir Robert Berkeley, the king’s bench justice who supported the imposition of ship-money, was ancestor of the Berkeleys of Spetchley, now the only branch of the house among entitled squires. See John Smith’s Lives of the Berkeley, compiled in 1618, edited by Sir John Maye (1883–1885); J. H. Round’s introduction to the Somerset Domesday, V.C.H. series; G. E. (Cokayne’s Complete Peerage; Jeayes’s Descriptive Catalogue of the Charters and Records of Berkeley Castle (1895); Dictionnaire de la Biographie; Transactions of Bristol and Gloucestershire Archaeological Society, 3 vols., viii., xiv., et passim; The Red Book of the Exchequer, Chronicles of Roger of Wendover, Matthew Paris, Adam of Muriel, Sir Thomas Stradon, Thomas, Letters of Huntington, England (Rolls Series); British Museum Charters, &c. (O. B.A.).

BERKELEY, GEORGE (1685–1753). Irish bishop and philosopher, the eldest son of William Berkeley (an officer of customs who had, it seems, come to Ireland in the suite of Lord Berkeley of Stratton, lord lieutenant, 1670–1672, to whom he was related), was born on the 12th of March 1685, in a cottage near Dysert Castle, Thomastown, Ireland. He passed from the school in Kilkenny to Trinity College, Dublin (1700), where, owing to the peculiar subtlety of his mind and his determination to accept no doctrine on the evidence of authority or convention, he left the beaten track of study and was regarded by some as a dunce, by others as a genius. During his career at Dublin the works of Descartes and Newton were superseding the older text-books, and the doctrines of Locke’s Essay were eagerly discussed. Thus he “entered on an atmosphere which was beginning to be charged with the elements of reaction against traditional scholasticism in physics and in metaphysics” (A. C. Fraser). He had been a student of John Toland, and Berkeley’s philosophy led him to take a prominent share in the foundation of a society for discussing the new principles, and is further shown by his Common Place Book, one of the most valuable autobiographical records in existence, which throws much light on the growth of his ideas, and enables us to understand the significance of his early writings. We find here the consciousness of creative thought focused in a new principle which is to revolutionize speculative science. There is no sign of any intimate knowledge of ancient or scholastic thought; to the doctrines of Spinoza, Leibnitz, Malebranche, Norris, the attitude is one of indifference or lack of appreciation, but the influence of Descartes and specially of Locke is evident throughout. The new principle (nowhere in the Common Place Book explicitly stated) may be expressed in the proposition that no existence is conceivable—and therefore possible—which is not either conscious spirit or the ideas (i.e. objects) of which such spirit is conscious. In the language of a later period this principle may be expressed as the absolute synthesis of subject and object; mind is, therefore, present in thought and in existence, if for the moment we assume the popular distinction. Berkeley thus diverted philosophy from its beaten track of discussion as to the meaning of matter, substance, cause, and preferred to ask first whether these have any significance apart from the conscious spirit. In the pursuit of this inquiry he rashly invaded other departments of science, and much of the Common Place Book is occupied with a polemic, as vigorous as it is ignorant, against the fundamental conceptions of the infinitesimal calculus. In 1701 he published two short mathematical tracts; in 1709, in his New Theory of Vision, he applied his new principle for the first time, and in the following year stated it fully in the Principles of Human Knowledge. In these works he attacked the existing theories of externality which to the unphilosophical mind is proved by visual evidence. He maintained that visual consciousness is merely a system of arbitrary signs which symbolize for us certain actual or possible tactile experience—in other words a purely conventional language.

The contents of the visual and the tactual consciousness have no element in common. The visible and visible signs are definitely connected with tactual experiences, and the association between them, which has grown up in our minds through custom or habit, rests upon, or is guaranteed by, the constant conjunction of the two by the will of the Universal Mind. But this synthesis is not brought forward prominently by Berkeley. It was evident that a similar analysis might have been applied to tactual consciousness which does not give externality in its deepest significance any more than the visual; but with deliberate purpose Berkeley at first drew out only one side of his argument. In the Principles of Human Knowledge, externality is recognized as an independent of all mind is conscious of. Matter, as an abstract, unperceived substance or cause, is shown to be impossible, an unreal conception; true substance is affirmed to be conscious spirit, true causality the free activity of such a spirit, while physical substantiality and causality are held to be merely arbitrary, though constant, relations among phenomena connected subjectively by suggestion or association, objectively in the Universal Mind. In ultimate analysis, then, nature is conscious experience, and forms the sign or symbol of a divine, universal intelligence and will.

In 1711 Berkeley delivered his Discourse on Passive Obedience, in which he deduced moral rules from the intention of God to promote the general happiness, thus working out a theological utilitarianism, which may be compared with the later expositions of Austin and J. S. Mill. From 1707 he had been engaged as college tutor; in 1712 he paid a short visit to England, and in April 1713 he was presented by Swift at court. His abilities, his courtesy and his upright character made him a universal favourite. While in London he published his Dialogues (1713), a more popular exposition of his new theory; for exquisite facility of style these are among the masterpieces in the English language. In November he became chaplain to Peterborough, whom he accompanied on the continent, returning in August 1714. He travelled again in 1715–1720, as tutor to the only son of Dr St George Ashe (1658–1718, bishop successively of Cloyne, Clogher and Derry). In 1721, during the disturbed state of social relations consequent on the bursting of the South Sea bubble, he published an Essay towards preventing the Ruin of Great Britain, which shows the intense interest he took in practical affairs. In the same year he returned to Ireland as chaplain to the duke of Grafton, and was made
BERKELEY, BISHOP

divinity lecturer and university preacher. In 1722 he was appointed to the deanship of Dromore, a post which seems to have entailed no duties, as we find him holding the offices of Hebrew lecturer and senior proctor at the university. The following year Miss Vanhomrigh, Swift's Vanessa, left him half her property. It would appear that he had only met her once at dinner. In 1724 he was nominated to the rich deanship of Derry, but had hardly been appointed before he was using every effort to resign it in order to devote himself to his scheme of founding a college in the Bermudas, and extending its benefits to the Americans. With infinite exasperation he succeeded in obtaining from government a promise of 2000l. per annum and after an expedition special operation failed in September 1728, accompanied by some friends and by his wife, daughter of Judge Forster, whom he had married in the preceding month. Three years of quiet retirement and study were spent in Rhode Island, but it gradually became apparent that government would never hand over the promised grant, and Berkeley was compelled to give up his cherished plan. Soon after his return he published the fruits of his studies in Alcephen, or the Minute Philosopher (1733), a finely written work in the form of a dialogue, critically examining the various forms of scepticism and bringing them to his own theory, which shows all nature to be the language of God. In 1734 he was raised to the bishopric of Cloyne. The same year, in his Analyst, he attacked the higher mathematics as leading to freethinking; this involved him in a hot controversy. The Querist, a practical work in the form of questions on what would now be called social or economical philosophy, appeared in three parts, 1735, 1736, 1737. In 1744 the elder son died, and in 1752 he removed with his family to Oxford for the sake of his son George, who was studying there. He died suddenly in the midst of his family on the 14th of January 1753, and was buried in Christ Church, Oxford.

In the philosophies of Descartes and Locke a large share of attention had been directed to the idea of matter, which was held to be the abstract, unperceived background of real experience, and was supposed to give rise to our ideas of external things through its action on the senses. Knowledge of these produced could never extend to the unappreciated matter, or substance, or cause which produced them, and it became a problem for speculation how it is possible to know or suppose the existence of matter. Philosophy seemed about to end in scepticism or in materialism. Now Berkeley put this whole problem in a new light by pointing out a preliminary question. Before we deduce results from experience, we must assume what cause, what principle, or essence do in reality mean?—what is the actual content of consciousness which corresponds to these words? Do not all these ideas, whether they be formal or substantial, belong to our consciousness alone, or do they exist apart from all knowledge of it, involve a contradiction? In putting this question, not less than in answering it, consists Berkeley's originality as a philosopher. The essence of the answer is that the universe is inconceivable apart from mind—that existence, as such, denotes conscious spirits and the objects of consciousness. Matter and external things, in so far as they are thought to have an existence beyond the circle of consciousness, are impossible, inconceivable. Everything which we can be sure of is in immediate perception. To this conclusion Berkeley seems, in the first place, to have been led by the train of reflection that naturally conducted to such an objection to materialism. It is indeed true that even the limits of self-consciousness; whatever words it use, whatever notions I have, must refer to and find their meaning in facts of consciousness. But this is by no means the whole or even the principal part of Berkeley's philosophy; it is essentially a theory of causality, and this is brought out gradually under the pressure of difficulties in the first solution of the early problem. To merely subjective idealism, sense percepts differ from ideas of imagination in degree, not in kind; both belong to the individual, but the one is in immediate perception, the other by the division of labour. Berkeley, however, the difference is fundamental; sense ideas are not due to our own activity; they must therefore be produced by some other will—by the divine will, which is thus the constant action upon our minds of supreme active intellect, and is not the consequence of dead inert matter. It might appear, therefore, that sensible things had an objective existence in the mind of God; that an idea so soon as it passes out of our conscious existence into that of God. This is an interpretation, frequent and not without some justice, put upon Berkeley's own expression. But it is not a satisfactory account of his theory. Berkeley is compelled to see that an immediate analysis means sensuous causality; that a theory of mere experience would be felt in conjunction with these. Our belief in the reality of a thing may therefore be said to mean assurance that this association in our minds between actual occurrences is infallible, and however many sensations we may have which are consistent with our own theory would never permit him to speak of possible sensations, meaning by that the ideas of sensations called up to our minds by present experience. He could never have held that these afforded the evidence of real existence of the objects which he supposed. His theory is quite distinct from this, which really amounts to nothing more than subjective idealism. External things are produced by the divine will, and the divinity of Man is in the same regular order; there exists in the divine mind archetypes, of which sense experience may be said to be the realization in our finite minds. Our belief in the permanence of which corresponds to the belief in our minds of a certain order of archetypes, the belief in the orderliness of nature; and that is merely assurance that the universe is pervaded and regulated by mind. Physical science is occupied in endeavouring to decipher the divine ideas which find realization in our limited experience, in trying to interpret the divine language of which natural things are the words and letters, and in striving to bring human conceptions into harmony with the divine idea. In this way of thinking the universe of another unknown, a living, active mind is looked upon as the centre and spring of the universe, and this is the essence of the Berkeleean metaphysics.

Deeper aspects of Berkeley's new thought have been almost universally neglected or misunderstood. Of his spiritual empiricism one side only has been accepted by later thinkers, and looked upon as the whole of his system. The more personal and philosophical side of Berkeley is an idealism by nature, the proposition warranted by consciousness; the empiricism of his philosophy has been eagerly welcomed, while the spiritual intuition, without which the whole is to Berkeley meaningless, has been cast aside. From this he is himself in no small measure to blame. The deeper spiritual intuition, present from the first, was only brought into clear relief in order to meet difficulties in the earlier statements, and in the expansion of the idea of the universe. The idea of self-consciousness, which completely removes his position from mere subjectivism, rests on foundations uncritically assumed, and at first sight irreconcilable with certain positions of his system. The necessity and universality of the judgments of causality and substantiality are taken for granted; and there is no investigation of the place held by these notions in the mental constitution. The relation between the divine mind and finite intelligence, at first found to be baffling to the mind, is most weightily expressed by Berkeley when the necessity for explaining the permanence of real things comes forward. The divine archetypes, according to which sensible things are to be divided, are the very bosom of the universe, different in kind from mere sense ideas, and the question then arises whether in these we have not again the "things as they are," which Berkeley at first so contemptuously dismissed. He leaves it undecided how far the mind knows whether the universe is not entirely presentative, involves some reference to this objective course of nature or thought of the divine mind. And if so, what is the nature of the notions necessarily implied in the simplest knowledge of a thing, as distinct from mere sense feeling? That in knowing objects certain thoughts are implied which are not presentations or their copies is at times dimly seen by Berkeley himself; but he was unable to ponder a question with regard to those notions, and to look upon them as merely Locke's idea of relation. Such ideas of relation are in truth the stumbling-block in Locke's philosophy, and Berkeley's empiricism is equally far from accounting for these ideas of relation.

With all these defects, however, Berkeley's new conception marks a distinct stage of progress in human thought. His true place in the history of speculation may be seen by comparing the difficulties or obstructions in his scheme with those on which later philosophy has turned. He once for all lifted the problem of metaphysics to a higher level, and, in conjunction with his successor, Hume, determined the form into which later meta-physical questions have been thrown.

BIBLIOGRAPHY.—The standard edition of Berkeley's works is that of A. Campbell Fraser in 4 vols. (1.-iii. Works; iv. Life, Letters and Dialogues) (Edinburgh, 1833-35). It has been published in London, revised throughout and largely re-written, was re-published by the same author (1901). Another complete edition edited by G. Sampson, with a life of Berkeley, and a complete bibliography, appeared in 1871-1897. Prof. Fraser also published an excellent volume of selections (5th ed., 1899), and a short general account in a volume on Berkeley in the Blackwood Philes. Class. For Berkeley's theory of vision see manuals of psychology (e.g. G. F. Stout, Wm. James); for his ethical views H. Sidgwick, Hist. of Ethics (5th ed., 1902); A. Bain, Mental and.
BERKELEY, M. J.—BERKELEY

BERKELEY, MILES JOSEPH (1803–1889), English botanist, was born on the 1st of April 1803, at Biggin Hall, Northamptonshire, and educated at Rugby and Christ's College, Cambridge, of which he became an honorary fellow. Taking holy orders, he became incumbent of Apethorpe in 1837, and vicar of Sibber- toft, near Market Harborough, in 1868. He acquired an enthusiastic love of cryptogamic botany in his early years, and soon was recognized as the leading British authority on fungi and plant pathology. He was especially famous as a systematicist in mycology, some 6000 species of fungi being credited to him, but his Introduction to Cryptogamic Botany, published in 1857, and his papers on "Vegetable Parasites" in the Gardener's Chronicle in 1854 and onwards, show that he had a very broad grasp of the whole domain of physiology and morphology as understood in those days. Moreover, it should be pointed out that Berkeley began his work as a field naturalist and collector, his earliest objects of study having been the mollusca and other branches of zoology, as testified by his papers in the Zoological Journal and the Magazine of Natural History, between 1828 and 1836. As a microscopist he was an assiduous and accurate worker, as is shown by his numerous drawings of the smaller algae and fungi, and his admirable dissections of mosses and hepaticae. His investigations of the Bryophyta, caused by Phytophthora infestans, on the grape mildew, to which he gave the name Oldium Tuckeri, and on the pathogenic fungi of wheat rust, hop mildew, and various diseases of cabbage, peas, coffee, onions, tomatoes, &c., were important in results bearing on the life-history of these pests, at a time when very little was known of such matters, and must always be considered in any historical account of the remarkable advances in the biology of these organisms which were made between 1830 and 1880, and when it is remembered that this work was done without the aid of the modern "Vegetable Parasites" in the Gardener's Chronicle, the real significance of Berkeley's pioneer work becomes apparent. It is as the founder of British mycology, however, that his name will live in the history of botany, and his most important work is contained in the account of native British fungi in Sir W. Hooker's British Flora (1836), in his Introduction to Cryptogamic Botany (1857), and in his Outlines of British Fungology (1860). His magnificent herbarium at Kew, which contains over 9000 specimens, and is enriched by numerous notes and sketches, forms one of the most important type series in the world. Berkeley died at Sibbertoft on the 30th of July 1890. He was a man of refined and courteous bearing, an accomplished classical student, with the simple and modest habits that befit a man of true learning.

A list of his publications will be found in the Catalogue of Scientific Papers of the Royal Society, and sketches of his life in Proc. Roy. Soc., 1890, 47, 9, by Sir Joseph Hooker, and Annals of Botany, 1890, 30, 565, by E. T. Thiers.

BERKELEY, SIR WILLIAM (c. 1668–1677), British colonial governor in America, was born in or near London, England, about 1668, the youngest son of Sir Maurice Berkeley, an original member of the London Company of 1606, and brother of John, first Lord Berkeley of Stratton, one of the proprietors of the Carolinas. He graduated at Oxford in 1629, and in 1632 was appointed one of the royal commissioners for Canada, in which office he won the personal favour of Charles I., who appointed him a gentleman of the privy chamber. During this period he tried his hand at literary work, producing among other things a tragic-comedy entitled The Lost Lady (1638). In August 1641 he was appointed governor of Virginia, but did not assume his duties until the following year. His first term as governor, during which he seems to have been extremely popular with the majority of the colonists, was notably favorable for his religious intolerance and his expulsion of the Puritans, who were in a great minority. During the Civil War in England he remained loyal to the king, and offered an asylum in Virginia to Charles II. and the loyalists. On the arrival of a parliamentary fleet in 1652, however, he retired from office and spent the following years quietly on his plantation. On the death, in 1660, of Samuel Mattie, the last parliamentary governor, he was chosen governor by the Virginia assembly, and was soon recommissioned by Charles II. His natural arrogance and tyranny seems to have increased with years, and the second period of his governorship was a stormy one. Serious frontier warfare with the Indians was followed (1676) by Bacon's Rebellion (see Virginia), brought on by Berkeley's misrule, and during its course all his worst traits became evident. His cruelty and barbarity in punishing the rebels did not meet with the approval of Charles II., who is said to have remarked that "the old fool has put to death more people in that naked country than I did here for the murder of my father." Berkeley was called to England in 1677 ostensibly to report on the condition of affairs in the colony, and a lieutenant-governor (Herbert Jeffreys) was put in his place. Berkeley sailed in May, but died soon after his arrival, at Twickenham, and was buried there on the 13th of July 1677. In addition to the play mentioned he wrote A Discourse and View of Virginia (London, 1678). BERKELEY, a city of Alameda county, California, U.S.A., on the E. shore of San Francisco Bay, named after Bishop Berkeley on account of his line "Westward the course of empire takes its way." Pop. (1890) 5103; (1900) 13,214, of whom 3216 were foreign-born; (1910) 40,434. It is served by the Southern Pacific and the Santa Fé railway systems, both transcontinental; and is connected by electric lines (and ferry) with San Francisco, and by five electric lines with Oakland. Its attractive situation and pleasant outlooks have made it a favourite residential suburb of San Francisco, which lies at a distance of 7 m. across the bay. Berkeley is the seat of the California state university (see California, University of), opened in 1873; the inter-related Berkeley Bible Seminary (1866, Disciples of Christ); Pacific Theological Seminary (established in 1866 at Oakland, in 1901 at Berkeley, Congregational); Seminary of the Pacific Coast Baptist Theological Union, and Unitarian Theological School—all associated with the University of California; and the state institution for the deaf, dumb and blind. The site of Berkeley was a farming region until its selection for the home of the university. Berkeley was incorporated as a town in 1878.

As BERKELEY, a market town of Gloucestershire, England, near the river Severn, in that part of its valley known as the Vale of Berkeley, on a branch from the Midland railway. Pop. (1901) 774. It is pleasantly situated on a gentle eminence, in a rich pastoral vale to which it gives name, celebrated for its dairy, producing the famous cheese known as "double Gloucester." The town has a handsome church (Early English and Decorated), a grammar school, and some trade in coal, timber, malt and cheese. Berkeley was the birthplace of Dr Edward Jenner (1749), who is buried in the church. Berkeley Castle, on an eminence south-east of the town, is one of the noblest baronial castles in England. The late Duke of Beaufort had a new and splendid ship canal connects Gloucester with docks at Sharpness, avoiding the difficult navigation of the upper part of the Severn estuary.

The manor of Berkeley gives its name to the noble family of Berkeley (q.v.). According to tradition, a nunnery to which the manor belonged existed here before the Conquest, and Earl Godwin, by bringing about its dissolution, obtained the manor. All that is certainly known, however, is that in Domesday the manor is assigned to one Roger, who took his surname from it. His descendants seem to have been ousted from their possessions during the 12th century by Robert Fitz Harding, an Angevin partisan, who already held the castle when, in 1155, Henry de Normandy (who became King Henry II in the following year), granted him the manor. Under an agreement made in the same year, Maurice, son of Robert Fitz Harding, married a daughter
BERKHAMSTEAD—BERKSHIRE

of Roger of Berkeley. Their descendants styled themselves of Berkeley, and in 1200 the town was confirmed to Robert of Berkeley with toll, soc, sac, &c., and a market on whatever day of the week he chose to hold it. This charter was confirmed to Thomas, Lord Berkeley, in 1330, and in 1353–1366 Lord Berkeley received a grant of another fair on the vigil and day of Holyrood. The descendants of the Berkeley family still hold the manor and town. Berkeley Castle was the scene of the death of Edward II. The king was at first entrusted to the care of Lord Berkeley, who, being considered too lenient, was obliged to give up his prisoner and castle to Sir John Mautravers and Thomas Gournay. The town has no charter, but has been described as a borough in 1284–1285. It was governed by a mayor and twelve burgesses from 1554, though this change had become merely nominal, and the corporation was dissolved in 1885 under the Municipal Corporations Act. Berkeley was formerly noted for the manufacture of clothing, but the trade had decreased by the 17th century, for Leland, writing about 1520, says "the town of Berkeley is no great thing. . . . It hath very much occupied and yet somewhat doth clothing."

Sec John Fisher, History of Berkeley (1804).

BERKSHIRE (Great Berkshire), a market town in the Watford parliamentary division of Hertfordshire, England. It lies near the southern border of Berkshire, and is connected by the Metropolitan Southern railway. Pop. of urban district (1901) 5145. It lies pleasantly in the narrow well-wooded valley of the Bulborne, and is close to the Grand Junction canal. The church of St Peter, a large cruciform structure, exhibits all the Gothic styles, and earlier fragments are traceable. There are several brasses of interest. The poet William Cowper was born in the rectory in 1731. The large grammar school is a foundation of 1541. Straw-plaiting and the manufacture of small wooden wares are the principal industries, and there are large chemical works. Of the castle earthworks and fragments of walls remain. The name of the town is Great Berkhamstead (or Berkhamsted), in distinction from Little Berkhamstead near Hatfield in this county.

Berkhamsted (Beorhhamstede, Berchehamstede) was undoubtedly of some importance in Saxon times since there were fifty-two burgesses there at the time of the Conquest. In 1156 Henry II. granted the men and merchants of the town the same laws and customs as they had in the time of Edward the Confessor, and that they should be quit of toll throughout England. Normandy, Aquitaine and Anjou. Berkhamsted rose to importance with the castle, which is said to have been built by Robert, count of Mortain, and when the castle fell it was destroyed. In 1496 the town also began to decay. In 1618, however, the burgesses received an incorporation charter; but after the civil wars the corporate body began to fall through poverty, and in the 18th century had ceased to exist. The burgesses returned two members to parliament in 1320 and again in 1338 and 1341, but were never re-elected again. Before the 13th century the burgesses held a weekly market on Sunday and a yearly fair on St James's day, but in 1218 Henry III. altered the market day to Monday. Roofing tiles were manufactured in Berkhamstead as early as the 13th century, and in Elizabeth's reign the making of malt was the chief industry.

BERKSHIRE, THOMAS HOWARD, 1st Earl of (1587–1669), 2nd son of Thomas Howard, 1st earl of Suffolk and of Catherine, daughter of Sir Henry Knevet, Kt., widow of Richard Rich, was baptized on the 5th of October 1587. He succeeded to his mother's estate of Charlton in Wiltshire, was created K.B. in 1605, became master of the horse to Prince Charles, and was created Lord Howard of Charlton and Viscount Andover in 1622, K.G. in 1626, and Earl of Berkshire in 1626. In 1634 he was chosen high steward of the university of Oxford, and was a commissioner for the administration of the college of Ripon in 1649, and accompanied the king to York in 1642. While attempting to execute the king's commission of array in Oxfordshire in August he was taken prisoner by Hampden at Watlington and imprisoned in the Tower, but after being censured by the Lords was liberated in September. In 1643 he was made governor of the prince of Wales, a post for which he was in no way fitted, and in which he showed himself factious and obstructive. He accompanied the prince to Scilly and to Jersey, but on the latter's departure for France went to Holland. At the Restoration he was made a privy councillor between receiving the knighthood. He died on the 5th of July 1669, and was buried in Westminster Abbey. According to Clarendon "his affection for the crown was good; his interest and reputation less than anything but his understanding." He married Elizabeth, daughter and co-heir of William, earl of Exeter, by whom he had nine sons and four daughters. Of these Charles succeeded him as 2nd earl of Berkshire; Thomas succeeded the latter; and Philip was ancestor of John, 15th earl of Suffolk and 8th earl of Berkshire, and so of the later earls of Suffolk and Berkshire.

BERKSHIRE (Suffolk), a county of England, bounded N. by Oxfordshire and Buckinghamshire, E. by Surrey, S. by Hampshire, W. by Wiltshire, and N.W. for a short distance by Gloucestershire. Its area is 712 sq. m. Its entire northern boundary is formed by the river Thames, in the basin of which practically the whole county is included. In the north-west a narrow and broken line of hills, pierced in the west by the Cole stream, which here forms the county boundary, extends past Faringdon and culminates in a height over 500 ft. at Cumnor Hurst, which, with Wytham Hill, Chalkland of the Kennet valleys, and overlooks the city of Oxford from the west. The range of mountains runs from the Thames valley from the Vale of White Horse which is traversed by the small river Ock, and bounded on the south by a line of hills known as the White Horse Hills or Berkshire Downs, richly wooded along their base, and rising sharply to bare rounded summits. In White Horse Hill on the western confines of the county a height of 865 ft. is reached. The line of these hills is continued north-eastward by the Chiltern Hills in Oxfordshire, but a division between the two is made by the Thames in a narrow valley or gap at Goring. Southward the Downs are bordered with deep narrow valleys, the valley of the Lambourn and the Pang. The last stream runs eastward directly to the Thames; but the Lambourn and others join the Kennet, which drains a beautiful sylvan valley to the Thames at Reading. Another line of downs closely confines the vale of Kennet on the south from Newbury upwards, and although the greater part of these does not fall within the county, their highest point, Inkpen Beacon (1011 ft.), does so. The Enborne stream, rising here, and flowing parallel to the Kennet until turning north to join it, is for a considerable distance the county boundary. Between the Thames and the Downs is a large heath, the great part of which, to the east of the Lambourn and the Pang. The last stream runs eastward directly to the Thames; but the Lambourn and others join the Kennet, which drains a beautiful sylvan valley to the Thames at Reading. Another line of downs closely confines the vale of Kennet on the south from Newbury upwards, and although the greater part of these does not fall within the county, their highest point, Inkpen Beacon (1011 ft.), does so. The Enborne stream, rising here, and flowing parallel to the Kennet until turning north to join it, is for a considerable distance the county boundary. Between the Thames and the Downs is a large heath, the great part of which, to the east of the

Geology.—The dominant feature of the county, the Chiltern and White Horse Hills, owes its form to the Chalk, which spreads from Ashbury and Hungerford on the west to Henley and Maidenhead on the east. In the northern face of the escarpment we find the Lower Chalk with a hard bed, the Tottenshaw Stone; on the southern slope lies the Chalk-Whitlins. At Clifton it is quarried for the manufacture of whit. At the foot of the chalk bed is the Upper Greensand with a narrow crop towards the west which is broken up into patches eastward. Looking northward from the Chalk hills, the low-lying ground is occupied successively by the Gault Clay, the Kimmerton Clay, and finally by the Oxford Clay, which extends beyond the Thames into Oxfordshire. This low-lying tract is relieved by an elevated ridge of Corallian beds, between the Kimmerton Clay and the Gault. It extends from near Faringdon past Abingdon

he showed himself factious and obstructive. He accompanied the prince to Scilly and to Jersey, but on the latter's departure for France went to Holland. At the Restoration he was made a privy counsellor between receiving the knighthood. He died on the 5th of July 1669, and was buried in Westminster Abbey. According to Clarendon "his affection for the crown was good; his interest and reputation less than anything but his understanding." He married Elizabeth, daughter and co-heir of William, earl of Exeter, by whom he had nine sons and four daughters. Of these Charles succeeded him as 2nd earl of Berkshire; Thomas succeeded the latter; and Philip was ancestor of John, 15th earl of Suffolk and 8th earl of Berkshire, and so of the later earls of Suffolk and Berkshire.

BERKSHIRE, THOMAS HOWARD, 1st Earl of (1587–1669), 2nd son of Thomas Howard, 1st earl of Suffolk and of Catherine, daughter of Sir Henry Knevet, Kt., widow of Richard Rich, was baptized on the 5th of October 1587. He succeeded to his mother's estate of Charlton in Wiltshire, was created K.B. in 1605, became master of the horse to Prince Charles, and was created Lord Howard of Charlton and Viscount Andover in 1622, K.G. in 1626, and Earl of Berkshire in 1626. In 1634 he was chosen high steward of the university of Oxford, and was a commissioner for the administration of the college of Ripon in 1649, and accompanied the king to York in 1642. While attempting to execute the king's commission of array in Oxfordshire in August he was taken prisoner by Hampden at Watlington and imprisoned in the Tower, but after being censured by the Lords was liberated in September. In 1643 he was made governor of the prince of Wales, a post for which he was in no way fitted, and in which

to Cumnor and Wytham Hill. At Faringdon there are some interesting gravels of Lower Greensand age, full of the fossil remains of sponges. South of the Chalk, the county is occupied by Eocene rocks, unrolled clays, well exposed in the brickfields about Reading, and hence called the Reading beds. At Finchampstead, Sunninghill and Ascot, these deposits are overlaid by the much sandy beds of the Bagshot series. Between the two last named formations is a broad outcrop of London Clay. Numerous outliers of Eocene rest on the Chalk beyond the main line of boundary. The Chalk of Inkpen Beacon is brought up to the southern side of the Tertiary rocks by a synclinal fold; similarly, an anticline has brought up the small patch of Chalk in Windsor Park. Clay-with-Flints lies in patches and holes on the Poplar and flat gravels places; high up on either side of the Thames. Fairly thick beds of peat are found in the alluvium of the Kennet at Newbury.

Industries.—About seven-ninths of the total area is under cultivation; a large proportion of this being in permanent pasture, as much attention is paid to dairy-farming. Butter and cheese are largely produced, and the making of condensed milk is a branch of the industry. Many sheep are pastured on the Downs, important sheep-markets being held at the small town of East or Market Iseley; and an excellent breed of pigs is now being raised in the county. The part about the培训机构 is noted for them. Oats are the principal grain crop; although a considerable acreage is under wheat. Turnips and swedes are largely cultivated, and apples and cherries are grown. Besides the royal castle of Windsor, fine county seats are especially numerous.

The only manufacturing centre of first importance is Reading, which is principally famous for its biscuit factories. The manufacture of clothing and carpets is carried on at Abingdon; but a woollen industry introduced into the county as early as the Tudor period is long extinct. Engineering works and paper mills are established at various places; and boat-building is carried on at Reading and other riverside stations. There are extensive seed warehouses and testing grounds near Reading; and the Kennet and Windsor ales are in high repute. Whiting is manufactured from chalk at Kintbury on the Kennet.

Communications.—Communications are provided principally by the Great Western railway, the main line of which crosses the county from east to west by Maidenhead, Reading and Didcot. A branch line serves the Kennet valley from Reading; and the northern line of the company leaves the main line at Didcot, a branch from it serving Abingdon. The Basingstoke branch runs from Reading, and lines from Wallingford, Hungerford, Cholsey, and Faringdon from Uffington. Communication with the south of England is maintained by a joint line of the South Western and South Eastern & Chatham companies terminating at Reading, and there are branches of the Great Western and South Western systems to Windsor. The Lambourn valley light railway runs north-west to Lambourn from Newbury. Wide water-communications are afforded by the Thames, and the Kennet is in part canalized, to form the eastern portion of the Kennet and Avon canal system, connecting with the Bristol Avon above Bath.

I. Topography. and Administration.—The area of the ancient county is 462,208 acres; with a population in 1891 of 320,138, and in 1901 of 256,509. The area of the administrative county is 462,457 acres. The county contains twenty hundreds. The municipal boroughs are Abingdon (pop. 6,840), Maidenhead (12,900), Newbury (11,601), Reading, the county town and a county borough (72,217), Wallingford (2,808), Windsor or New Windsor (14,130), Wokingham (3,551). Wantage (3,760) is an urban district. Among lesser towns may be mentioned Faringdon in the north-west (2,809), Hungerford on the Kennet (2,009), and Lambourn in the valley of that name (2,077), the villages of Bray (978), Cookham (894) and Tilehurst (2,545) which, like others on the banks of the Thames, have grown into residential towns; and Sandhurst (2,586). The county is in the Oxford circuit, and assizes are held at Reading. It has one court of quarter sessions, and is divided into twelve petty sessional divisions. The boroughs of Abingdon, Newbury, Maidenhead, Reading, Wallingford and Windsor have separate commissions of the peace, and Abingdon, Newbury, Reading and Windsor have separate courts of quarter sessions. There are 108 civil parishes. Berkshire forms an archdeaconry in the diocese of Oxford; a small portion, however, falls within the diocese of Salisbury. There are 202 ecclesiastical parishes or districts, wholly or in part within the county. There are three parliamentary divisions, Northern or Abingdon, Southern or Newbury, and Eastern or Wokingham, each returning one member; while the parliamentary borough of Reading returns one member, and parts of the borough of Oxford and Windsor are included in the county. There are several important educational establishments in the county. Radley College near Abingdon, Wellington College near Sandhurst, and Bradfield College, at the village of that name, S. m. west of Reading, are among the more important modern public schools for boys. Bradfield College was founded in 1850, and is well known for the realistic performances of classical Greek plays presented by the scholars in an open theatre designed for the purpose. Abingdon and Reading schools rank among the lesser public schools. At Reading is a university extension college, and in the south-east of the county is the Sandhurst Royal Military College.

History.—During the Heptarchy Berkshire formed part of the kingdom of Wessex, and interesting relics of Saxon occupation have been discovered in various parts of the county. Of these the most remarkable are the burial grounds at Long Wittenham and Friolord, and there is evidence that the Lambourn valley was occupied in early Saxon times. The cinerary urns found in Berkshire undoubtedly contain the ashes of the Anglians who came south under Penda in the 7th century. The fortification called Cherbury Castle, not far from Denchworth, is said to have been first made up by Canute. At the battle of Hastings the county was formed part of the earldom of Harold, and supported him stanchly at the battle of Hastings. This loyalty was punished by very sweeping confiscations, and at the time of the Domesday survey no estates of any importance were in the hands of Englishmen. When Alfred divided the country into shires, this county received the name of Berroiscir, as Asser says, "from the wood of Berro, where the box-tree grows most plentifully." At the time of the survey it comprised twenty-two hundreds; at the present day there are only twenty, of which eleven retain their ancient names. Many parishes have been transferred from one hundred to another, and the boundaries of the county are practically unchanged. Part of the parishes of Shilton and Langford formed detached portions of the shire, until included in Oxfordshire in the reign of William IV. Portions of Combe and Shalbourne parishes have also been restored to Hampshire and Wiltshire respectively, while the Wiltshire portion of Hungerford has been transferred to Berkshire. The county was originally included in the see of Winchester, but in A.D. 906 it was removed to the newly-formed see of "Wiltshire," afterwards united with Sherborne. In 1075 the seat of the bishopric was transferred to Salisbury, and in 1356 by an order in council Berkshire was transferred to the diocese of Oxford. The archdeacony is of very early origin and is co-extensive with the county. Formerly it comprised four rural deaneries, but the number has lately been increased to nine. Much of the early history of the county is recorded in the Chronicles of the abbey of Abingdon, which at the time of the survey was second only to the crown in the extent and number of its possessions. The abbots also exercised considerable judicial and administrative powers, and his court was endowed with the privileges of the hundred court and was freed from liability to interference by the sheriff. Berkshire and Oxfordshire had a common sheriff until the reign of Elizabeth, and the shire court was held at Grauntfoot. The assizes were formerly held at Reading, 1

1 The derivation from Bilbocir, a British tribe in the time of Caesar, which probably inhabited Surrey or Middlesex, seems philologically impossible.
BERLAD

Abingdon and Newbury, but are now held entirely at Reading.

At the time of the Domesday survey the chief lay-proprietor was Henry de Ferrers, ancestor of the earls of Derby, but it is remarkable that none of the great Berkshire estates has remained with the same family long. Thomas Fuller quaintly observes that "the lands of Berkshire are very skittish and apt to cast their owners." The De la Pole family succeeded to large estates by a marriage with the heiress of Thomas Chaucer, son of the poet, but the family became extinct in the male line, and the estates were alienated. The same fate befell the estates of the Achards, the Fitzwarrens and later the families of Norris and Befils.

The natural advantages of this county have always encouraged agriculture rather than commercial pursuits. The soil is especially adapted for sheep-farming, and numerous documents testify to the importance and prosperity of the wool-trade in the 12th century. At this first trade was confined to the export of the raw material, but the reign of Edward III. saw the introduction of the clothing industry, for which the county afterwards became famous. This trade began to decline in the 17th century, and in 1641 the Berkshire clothiers complained of the deadness of their trade and the difficulty of getting ready money, attributing the depression in the export of their wares mostly to the clothing industry and the timber trade also flourished in the county until the 16th century. Agriculturally considered, the Vale of the White Horse is especially productive, and Camden speaks of the great crops of barley grown in the district.

Owing to its proximity to London, Berkshire has from early times been the scene of frequent military operations. The earliest recorded historical fact relating to the county is the occupation of the district between Wallingford and Ashbury by Offa in 758. In the 10th and 11th centuries the county was greatly impoverished by the ravages of the Danes, and in 871 they were defeated by Æthelwulf at Englefield and again at Reading. During the disorders of Stephen's reign Wallingford was garrisoned for Matilda and was the scene of the final treaty in 1153. Meetings took place between John and his barons in 1213 at Wallingford and at Reading, and in 1216 Windsor was besieged by the barons. At the opening of the civil war of the 17th century, the sheriff, on behalf of the inhabitants of Berkshire, petitioned that the county might be put in a posture of defence, and here the royalists had some of their strongest garrisons. Reading endured a ten days' siege by the parliamentary forces in 1642, and Wallingford did not surrender until 1646. Newbury was the site of two battles in 1643 and 1644.

In 1205, Berkshire returned two members to parliament for the county and two for the borough of Reading. Later the boroughs of Newbury, Wallingford, Windsor and Abingdon secured representation, and from 1557 until the Reform Act of 1832 the county was represented by a total of ten members. By this act Abingdon and Wallingford were each deprived of a member, but the county returned three members instead of two. Since the Redistribution of Seats Act 1885 the county has returned three members for three divisions, and Windsor and Reading return one member each, the remaining boroughs having lost representation.

Antiquities.—The remains of two great Benedictine monasteries at Abingdon and Reading are scanty. The ecclesiastical architecture of the county is not remarkable, excepting a few individual churches. Thus for Norman work the churches of Shellingford and Cholsey may be noted, together with the very small chapel, of early date, at Upton near Didcot. The church of Windham in the same locality is in the main a transplant of Norman, and retains some of its original vaulting. Of Early English churches there are several good examples, notably at Uffington, with its unusual angular-headed windows, Buckland near Faringdon, and Wantage. The tower of St Helen's, Abingdon, well illustrates this period. The cruciform church of Shottesbrooke, with its central spire, is a beautiful and almost unaltered Decorated building; and St George's chapel in Windsor Castle is a superb specimen of Perpendicular work.

Apart from Windsor, Berkshire retains no remarkable medieval castles or mansions.

TUTUAVES.—Chief of the older works are: Elias Ashmole, Antiquities of Berkshire (3 vols., 1719, 2nd ed., London, 1723; 3rd ed., Reading, 1730); D. and S. Lysons, Magna Britannia, vol. i. Other works are: Marshall, Topographical and Statistical Details of the County of Berkshire (London, 1808); Archibald Fullarton, Archaeology of Berkshire (London, 1859); C. King, History of Berkshire (London, 1887); Lowesly, Glossary of Berkshire Words (London, 1880); and Bury to Will's in the Court of the Archdeacon of Berkshire, 1508-1525 (Oxford, 1863); Victoria County History, Berkshire. See also The Berks Archaeological Society's Quarterly Journal, and Berkshire Notes and Queries.

BERBLAD, the capital of the department of Tutova, Romania, on the river Beller. The waters of the high plains of Rumania and Moldavia. Pop. (1900) 24,484, about one-fourth of whom are Jews. At Beller the railway from Jassy diverges, one branch skirting the river Sereth, the other skirting the Pruth; both reunite at Galatz. Among a maze of narrow and winding streets Beller possesses a few good modern buildings, including a fine hospital, administered by the St Spiridion Foundation of Jassy. Beller has manufactures of soap and candles, and some trade in timber and farm-produce, while the annual horse-fairs are visited by dealers from all parts of the country. In the vicinity are the ruins of the Roman town of Rustica.

BERLICHINGEN, GOETZ of GOTTFRIED VON (1480-1562), German knight, was born at the castle of Jagsthauzen now in Württemberg. In 1497 he entered the service of Frederick IV., margrave of Brandenburg-Ansbach, and in 1498 fought for the emperor Maximilian I. in Burgundy, Lorraine and Brabant, and next year in Switzerland. About 1500 he raised a company of mercenaries, and at their head took part in various private wars. In 1505, whilst assisting Albert IV., duke of Bavaria, at the siege of Landschut, his right hand was shot away, and an iron one was substituted which is still shown at Jagsthauzen. In spite of this "Goetz with the iron hand" soon showed his feats of arms to be merely boastful and rampant. In 1512 an attack near Forchheim on some merchants returning from the great fair at Leipzig, caused him to be put under the ban of the empire by Maximilian, and he was only released from this in 1514 upon a promise to pay 14,000 gulden. In 1516 he made a raid into Hesse and captured Philip IV., count of Waldeck, whom he compelled to pay a ransom of 8,000 gold gulden, and in 1518 was again placed under the ban. He fought for Ulrich I., duke of Württemberg, when he was attacked by the Swabian League in 1521. After a defeat at Neideck, he was compelled to surrender without much resistance, and with the want of ammunition and provisions, to surrender the town of Möckmühl. In violation of the terms of the capitulation he was held prisoner, and handed over to the citizens of Heilbronn, but owing to the efforts of Sickingen and Georg von Frundsberg was released in 1522, upon paying 2000 gulden, and swearing not to take vengeance on the League. When the Peasants' War broke out in 1525 Goetz was compelled by the rebels of the Odenwald district to act as their leader. He accepted the position, according to his own account, partly because he had no choice, partly in the hope of curbing the excesses of the insurgents; but, finding himself in this respect powerless, after a month of ministerial leadership, he took the first opportunity of escaping to his castle. For his part in the rebellion he was called to account before the diet of Speier, and on the 17th of October 1526 was acquitted by the imperial chamber. In spite of this the Swabian League seized the opportunity of paying off old scores against him. Lured to Augsburg, under promise of safe conduct, to clear himself of the charges made against him on behalf of the League, he was there treacherously seized on the 28th of November 1528, and kept a close prisoner for two years. In 1530 he was libelled on repeating his oath of 1522, and undertaking not to leave the neighbourhood of his castle of Hornberg on the Neckar. He appears to have remained there quietly until 1540 when the emperor Charles V. released him from his oath. In 1542 he fought against the Turks in Hungary, and in 1544 accompanied Charles when he invaded France. He returned to Hornberg, where he passed his time until his death on the 23rd of July 1562. He was twice married and left three daughters and seven...
sons. The counts von Berlichingen-Rossach, of Helmstadt near Heidelberg, one of the two surviving branches of the family, are his descendants. The other branch, that of the Freiherrn von Berlichingen-Jagthaussen, is descended from Goetz's brother Hans. "Goetz von Berlichingen" is the title of Goethe's play, which, published in 1773, marked an epoch in the history of German drama (see Goethe).

See R. Fallmann, Der historische Goetz von Berlichingen (Berlin, 1894); E. W. G. Graf von Berlichingen-Rossach, Geschichte des Ritters Goetz von Berlichingen und seiner Familie (Leipzig, 1906). Goethe's Autobiography, valuable as a record of his times, was first published by Pistorius at Nuremberg (1731), and again at Halle (1788).

**BERLIN, ISAIAH** (1725-1790), an eminent rabbi of Breslau; he was the author of acute notes on the Talmud which had their influence in advancing the critical study of that work.

**BERLIN**, the largest city of the German empire, the capital of the kingdom of Prussia. It is the principal residence of the German emperor and king of Prussia, the seat of the imperial parliament (Reichstag) and the Prussian diet (Landtag) and of the state offices of the empire, except of the supreme court of justice (Reichsgericht), which is fixed at Leipzig. It lies in a flat, sandy plain, 150 ft. below sea-level, on both banks of the navigable Spree, which intersects it from S.E. to N.W. The highest elevation in the immediate neighbourhood is the Kreuzberg (200 ft.), a hill in the southern suburb of Schöneberg, which commands a fine view of the city. The situation of Berlin, midway between the Elbe and the Oder, with which rivers it is connected by a web of waterways, at the crossing of the main roads from Silesia and Poland to the North Sea ports and from Saxony, Bohemia and Thuringia to the Baltic, made it in medieval days a place of considerable commercial importance. In modern times the great network of railways, of which it is the centre and which mainly follow the lines of the old roads, further established its position. Almost equidistant from the remotest frontiers of Prussia, from north to south, and from west to east, 180 m. from Hamburg and 84 m. from Stettin, its situation, so far from being prejudicial to its growth and prosperity, as was formerly often asserted, has been, in fact, the principal determining factor in its rapid rise to the position of the greatest industrial and commercial city on the continent of Europe. In point of wealth and population it ranks immediately after London and Paris.

The city have not been essentially extended since 1866, and though large and important suburbs have crept up and practically merged with it, its administrative area remains unchanged. It occupies about 29 sq. m., and has a length from E. to W. of 6 and a breadth from N. to S. of 5½ m., contains nearly 1000 streets, has 87 squares and open spaces, 73 bridges and a population (1905) of 2,033,900 (including a garrison of about 22,000). If, however, the outer police district, known as "Greater Berlin," embracing an area of about 10 m. radius from the centre, be included, the population amounts to about 5½ millions.

Berlin is essentially a modern city, the quaint two-storied houses, which formerly characterized it, having given place to palatial business blocks, which somewhat dwarf the streets and squares, which once had an air of stately spaciousness. The bustle of the modern commercial city has superseded the austere dignity of the old Prussian capital. Thus the stranger entering it for the first time will find little to remind him of its past history. The oldest part of Berlin, the city and Alt-Kölln, built along the arms of the Spree, is, together with that portion of the town lying immediately west, the centre of business activity. The west end and the south-west are the residential quarters, the north-west is largely occupied by academic, scientific and military institutions, the north is the seat of machinery works, the north-east of the wooden manufactures, the east and south-east of the dyeing, furniture and metal industries, while in the south are great barracks and railway works.

In 1870 Berlin was practically bounded on the south by the Landwehr Canal, but it has since extended far beyond, and the Tempelhofer Feld, where military reviews are held, then practically in the country, is now surrounded by a dense belt of houses. The Landwehr Canal, leaving the Spree near the Schlesische Tor (gate), and rejoining it at Charlottenburg, after a course of 6 m., adds not a little to the charm of the southern and western districts, being flanked by fine boulevards and crossed by many handsome bridges. The object of this canal was to relieve the congestion of the water traffic in the heart of Berlin. It was superseded, however, in its turn by a new broad and deep canal opened in 1906, lying from 3 to 4 m. farther south. This, the Teltow Canal, leaves the Spree above Berlin at Köpenick, and running south of Rixdorf, Sündersee, and Unter- und Ober-Lichterfelde, enters the Havel at Teltow. This important engineering work was primarily to establish a more convenient waterway between the upper Spree and the Havel (and thus to the Elbe), but was to remove from the city to its banks and vicinities those factories of which the noxious gases and other poisonous emanations were regarded as dangerous to the health of the community. A dislocation of the manufacturing factors has therefore been in progress, which with the creation of a "trans Tiberim" (as in ancient Rome) is, in many respects, altering the character and aspect of the metropolis and banks of the Spree.

The effect upon Berlin of the successful issue of the Franco-Prussian War of 1870-71 was electrical. The old Prussian capital girded itself at once to fulfil its new rôle. The concentration upon the city of a large garrison flushed with victory, and eager to emulate the vanquished foe in works of peace, and vie with them in luxury, was an incentive to Berliners to put forth all their energy. Besides the military, a tremendous immigration of civilian officials took place as the result of the new conditions, and, as accommodation was not readily available, rents rose to an enormous figure. Doubts were often expressed whether the capital would be able to bear the burden of empire, so enormous was the influx of new citizens. It is due to the magnificent services of the municipal council that the city was enabled to assimilate the hosts of newcomers, and it is to its indefatigable exertions that Berlin has in point of organization become the model city of Europe. In no other has public money been expended with such enlightened discretion, and in no other has the municipal system kept pace with such rapid growth and displayed greater resource in emergencies. In 1870 the sanitary conditions of Berlin were the worst of any city in Europe. It needed a Virthow to open the eyes of the municipality to the terrible waste of life such a state of things entailed. But open sewers, public pumps, cobble-paved roads, open market-places and overcrowded subterranean dwellings are now abolished. The city is excellently drained, well-paved, well-lighted and furnished with an abundant supply of filtered water, while the cellar dwellings have given place to light and airy tenements, and Berlin justly claims to rank among the cleanest and healthiest capitals in Europe. The year 1878 marks a fresh starting-point in the development of the city. In that year Berlin was the meeting-place of the congress which bore its name. The recognition of Germany as a leading factor in the world's councils had been given, and the people of Berlin could indulge in the task of embellishing the capital in a manner befitting its position. From this time forward, state, municipal and private enterprise have worked hand in hand to make the capital cosmopolitan. The position it has at length attained is due not alone to the enterprise of its citizens and the municipality. The brilliancy of the court and the triumph of the sense of unity in the German nation over the particularism of the smaller German states have conducted more than all else to Berlin's result without being directly the cause of the victory of Germany; and though the standard of morality, owing to the enormous influx of people bent on amusement, has become lower, yet there is so much healthy, strenuous activity in intellectual life and commercial rivalry as to entitle it, despite many moral deficiencies, to be regarded as the centre of life and learning in Germany. Dr A. Shadwell (Industrial Efficiency, London, 1906) describes it as representing "the most complete application of science, order and method of public life," adding
it is a marvel of civic administration, the most modern and most perfectly organized city that there is.

**Strassen.—**The social and official life of the capital centres round Unter den Linden, which runs from the royal palace to the Brandenburger Tor. This street, one of the finest and most spacious in Europe, nearly a mile in length, its double avenue divided by a favourite promenade, planted with lime trees, presents Berlin life in all its varying aspects. Many historical events have taken place in this famous boulevard, notably the entry of the troops in 1871, and the funeral pageant of the aged Kaiser Wilhelm II., both of Unter den Linden lies the Friedrichstadt, with its parallel lines of straight streets, including the Behren-strasse,—(the seat of finance)—the Wilhelm-strasse, with the palace of the imperial chancellor, the British embassy, and many government offices—the official quarter of the capital—and the busy Leipziger-strasse, running from the Potsdamer-platz to the Dönhoff-platz. This great artery and Unter den Linden are crossed at right angles by the Friedrichstrasse, 2 m. long, flanked by attractive shops and restaurants, among them the beer palaces of the great breweries. In the city centre, sculptures; the Kunstakademie, the Kurfürstenstrasse, the latter a continuation of Unter den Linden, are the chief streets; while in the fashionable south-west quarter Viktoria-strasse, Bellevue-strasse, Potsdamer-strasse and Kurfürstenstrasse and the Kurfürstendamm are the most imposing. Among the most important public squares are the Opern-platz, around or near which stand the opera house, the royal library, the university and the armoury; the Gendarmen-markt, with the royal theatre in its centre, the Schloss-platz; the Lustgarten, between the north side of the royal palace, the cathedral and the old and new museums; the Pariser-platz with the French embassy, at the Brandenburg Gate; the Königs-platz, with the column of Victory, the Reichstagsgebäude and the Bismarck and Moltke monuments; the Wilhelms-platz; the circular Belle-Alliance-platz, with a column commemorating the battle of Waterloo; and, in the western district, the spacious Lützow-platz.

**Bridges.**—Of the numerous bridges, the most remarkable are the Schloss-brücke, built after designs by Schinkel in 1822—1824, with eight colossal figures of white marble, representing ideal stages in a warrior's life, the work of Drake, Albert Wolff and other eminent sculptors; the Kurfürstenbrücke, 2.4 miles long, built 1862—1895, and restored in 1895, with an equestrian statue of the great elector, and the Kaiser-Wilhelm-brücke (1886—1898) connecting the Lustgarten with the Kaiser-Wilhelm-strasse in the inner town. In the modern residential quarter are the Potsdamer-Viktoria-brücke, which carries the traffic from two converging streets into the outer Potsdamer-strasse, and the Herkules-brücke connecting the Lützow-platz with the Tiergarten. The first three cross the Spree and the last two the Landwehr Canal.

**Churches.**—Berlin, until the last half of the 19th century, was in respect of its churches probably the poorest of the capitals of Christendom, and the number of worshippers on an average Sunday was then less than 2% of the population. The city now contains over a hundred places of worship, of which ten are Roman Catholic, and nine Jewish synagogues. Of the older Evangelical churches but four date from medieval days, and of them only the Marien-kirche, with a tomb of Field marshal O. C. von Sparr (1605—1665), and the Nikolai-kirche are particularly noteworthy. Of a later date, though of no great pretensions to architectural merit, are the Petri-kirche with a lofty spire, the Schloßkirche, and the Kupferstichkabinett, in the dome of which is a colossal - (Zeughaus), the war office and the ministry of public works, while the royal mews (Marstall) has been entirely rebuilt with an imposing façade.
Among the public monuments comes first, in excellence, Rauch's celebrated statue of Frederick the Great, which stands in Unter-den-Linden opposite the palace of the emperor William I.; and in size the monument to the emperor William I., (by R. Weges), erected opposite the west portal of the royal palace. The space for the site was gained by pulling down the old houses composing the Schlossfriesen and damming the Spree. The monument, which cost £200,000, is surmounted by an equestrian statue of the emperor in a martial cloak, his right hand resting on a field marshal's baton, reining in his charger, which is led by a female genius of peace. The high pedestal on which these figures stand is surrounded by an Ionic colonnade. The equestrian statue of the great elector on the Lange-brücke has been already mentioned. In the Lustgarten is a statue of Frederick William III., by Wolff; in the Tiergarten, Drake's monument runs the broad same ruler; and in the third of the park in Charlottenburg he and his queen, Louisa, are sculptured in marble by Rauch. Here also lie the emperor William I. and the empress Augusta under marble effigies by Encke. A second group of monuments on the Wilhelms-platz commemorates the generals of the Seven Years' War; and a third in the neighbourhood of the opera-house the generals who fought against Napoleon I. On the Kreuzberg a Gothic monument in bronze was erected by Frederick William III. to commemorate the victories of 1813-1815; and in the centre of the Königs-platz stands a lofty column in honour of the triumphs of 1866 and 1870-1871, surmounted by a gilt figure of Victory. Literature, science and art are represented in different parts of the city by statues and busts of Rauch, Schinkel, Thaer, Beuth, Schadow, Winckelmann, Schiller, Hegel and Jahn. On the Königs-platz between the column of Victory and the Reichstagsgebäude, and immediately facing the western façade of the latter, is the bronze statue of Bismarck, unveiled in 1901, a figure 20 ft. in height standing on a granite base. From the south side of the Königs-platz crossing the Tiergarten and intersecting the avenue from the Brandenburg Gate to Charlottenburg runs the broad same ruler; and in the thirteenth group of marble statuary representing famous rulers of the house of Hohenzollern, the gift of the emperor William II. to the city. The Tiergarten, the beautiful west-end park with its thickets of dense undergrowth and winding lanes and lakes has lost somewhat of its sylvan character owing to building encroachments on the north side and the laying out of new rides and drives. It has, in addition to those above enumerated, statues of Queen Louisa, Goethe and Lessing.

Communications.—Berlin is the centre of the North German network of railways. No fewer than twelve main lines connect the city. The rail network is served by the Ringbahn, or outer circle, which was opened in 1871, and by a well-devised system connects the termini of the various main lines. The through traffic coming from east and west is carried by the Stadtbahn, or city railway, which also connects with and forms an integral part of the outer circle. This line runs through the heart of the city, and was originally a private enterprise. Owning, however, to the failure of the company, the work was taken in hand by the state, and the line opened in 1876. It has four tracks—two for the main-line through traffic, and two for local traffic. Services are also maintained at a high speed of about 20 ft. above the streets. Its length is 12 m., the total cost £3 millions sterling. The chief stations are Zoologischer Garten, Friedrich-strasse, Alexander-platz and Schlesischer Bahnhof. Lying away from the system are the Lehrter Bahnhof for Hamburg and Bremen, the Stettin for Baltic ports, and the Görlitzer, Anhalter and Potsdam for traffic to the south, of which the last two are fine specimens of railway architecture. Internal communication is also provided for by an excellent system of electric tram-lines, by an overhead electric railway running from the Zoologischer Garten to the Schlesische Tor with a branch to the Potsdam railway station, and by an underground railway laid at a shallow depth under the Leipziger-strasse. Most of the cabs (victorias and broughams) have fare-indicators. Steamboats ply above and below the city.

Industry, Trade and Commerce.—It is in respect of its manufacture and trade that Berlin has attained its present high pitch of economic prosperity. More than 50% of its working population are engaged in industry, which embraces almost all branches, of which new ones have lately sprung into existence, while some of the older have taken a new lease of life. The old wool industry, for example, has recouped its losses, and now embraces such products as shawls, carpets, hosiery, &c. Its silk manufactures, formerly so important, have, however, gradually gone back. It is particularly in the working of iron, steel and cloth, and in the by-products of these, that Berlin excels. The manufacture of machinery and steam-engines shows an enormous development. No fewer than 100 large firms, many of them of world-wide reputation, are engaged in this branch alone. Among the chief articles of manufacture are railway plant, sewing machines, bicycles, steel pens, chronometers, electric and electric-telegraph plant, bronze, chemicals, soap, lamps, linoleum, china, pianofortes, furniture, gloves, buttons, artificial flowers and ladies' mantles, the last of an annual value exceeding £5,000,000. It has extensive breweries and vies in the amount of the output of this production with Munich. Berlin is also the great centre and the chief market for speculation in corn and other cereals which reach it by water from Poland, Austria and South Russia, while in commerce in spirits it rivals Hamburg. It is also a large publishing centre, and has become a serious rival to Leipzig in this regard. Writers of all names, from great professors to whom the chief market in Germany for stocks and shares, and its dealings are of great influence upon the gold market of the world. Numerous banks of world-wide reputation, doing an extensive international business, have their seats in Berlin, chief among them, in addition to the Reichebank, the Berlinische Kassen-Verein, the Diskontgesellschaft, the Deutsche Bank, and the Boden-Kredit Bank.

Learning and Art.—Berlin is becoming the centre of the intellectual life of the nation. The Friedrich Wilhelm University, although young in point of foundation, has long outstripped its great rival Leipzig in numbers, and can point with pride in the fact that its teaching staff has yielded to none in the number of illustrious names. It was founded in 1810, when Prussia had lost her celebrated university of Halle, which Napoleon had included in his newly created kingdom of Westphalia. It was as a weapon of war, as well as a nursery of learning, that Frederick William III. and the great men who are associated with its origin, called it into existence. Wilhelm von Humboldt was at that time at the head of the educational department of the kingdom, and men like Fichte and Schleiermacher worked upon the popular mind. Within the first ten years of its existence the university numbered among its professors such names as Sander, Stemmler, Eichhorn, Buik, Beck, Hegel, Raumer, Niebuhr and Buttmann. Later followed men like Hengstenberg, Homeyer, Bethmann-Hollweg, Puchta, Stahl and Heffter; Schelling, Trendelenburg, Bopp, the brothers Grimm, Zumpt, Carl Richter; later still, Twesten and Dorner, Gneist and Hinschius; Langenbeck, Bardeleben, Virchow, Du-Bois-Reymond; von Ranke, Curtius, Lipsius, Hofmann the chemist, Kiepert the geographer; Helmholtz, van't Hoff, Koch, E. Fischer, Waldayer and von Bergmann among scientists and surgeons; Mommsen, Trichter, Hansemann, and Hospitals; all had their disciples among Bruener among jurists. Taking ordinary, honorary, extraordinary professors and licensed lecturers (Privat-docenten) together, its professorial strength consisted, in 1905-1906, of 23 teachers in the faculty of theology, 32 in that of law, 175 in that of medicine and 272 in that of philosophy—altogether 457. The number of matriculated students during the same period was 7154, as against 5488 in the preceding summer term. The number of matriculated students is usually greater in winter than in summer; for the reason of the disproportionate being that in the summer universities there having no business, such as Bonn, Heidelberg, Kiel and Jena, are more frequented. Berlin is essentially a Prussian university—of students from non-German states, Russia sends most, then the United States of America, while Great Britain is credited with comparatively
few. It is, however, in the ugly palace of Prince Henry of Prussia, which was given for the purpose in the days of Prussian poverty and distress, that the university is still housed, and although some internal rearrangement has been effected, no substantial alterations have been made to meet the ever-increasing demand for lecture-room accommodation. The gallery towards one of the sculptors, Rauch and Sonnleitner, is the statue of Helmholtz; the marble statues of Wilhelm and Alexander von Humboldt, which were formerly placed on either side of the gate, have been removed to the adjacent garden. Technical education is provided in the magnificent buildings erected at a cost of £100,000 in Charlottenburg, which are equipped with all the apparatus for the teaching of science. Among other institutions of university rank and affiliated to it are the school of mines, the agricultural college, the veterinary college, the new seminary for oriental languages, and the high school for music. The gothic institute has been removed to Potsdam. The university is, moreover, rich in institutions for the promotion of medical and chemical science, for the most part housed in buildings belonging to the governing body. There should also be mentioned the Royal Academy of Sciences, founded in 1700. The name of Leibnitz is associated with its foundation, and it was raised to the rank of a royal academy by Frederick the Great in 1743. The Royal Academy of Arts is under the immediate protection of the king, and is governed by a director and senate. There is also an academy of vocal music.

Theodore.—Berlin possesses fifteen Gymnasien (classical schools, for the highest branches of the learned professions), of which four are under the direct supervision of the provincial authorities and have the prefix königlich (royal), while the remaining eleven are municipal and under the control of the civic authorities. They are attended by about 7000 scholars, of whom a fourth are Jews. There are also eight Real-gymnasia (or "modern" schools), numerous Real-schulen (commercial schools), public high schools for girls, and commodious and excellently organized elementary schools.

The buildings of the royal museum are divided into the old and new museums. The former is an imposing edifice situated on the north-east side of the Lustgarten, facing the royal palace. It was built in the reign of Frederick William III. from designs by Schinkel. Its portico supported by eighteen colossal Ionic columns is reached by a wide flight of steps. The back and side walls of the portico are covered with frescoes, from designs by Schinkel, representing the world's progress from chaos to organic and developed life. The sides of the flight of steps support equestrian bronze groups of the Amazon by Kiss, and the Lion-slayer by Albert Wolff. Under the portico are mounted on columns, statues of the Kurfürsten of the 17th century by Schinkel, and the art critic Winningkeller. The interior consists of a souterrain, and of a first floor, entered from the portico through bronze doors, after designs by Stüler, weighing 73 tons, and executed at a cost of £3000. This floor consists of a rotunda, and of halls and cabinets of sculpture. The second floor, which formerly contained the national gallery of paintings, is occupied by a collection of northern antiquities and by the Schliemann treasures.

The new museum, connected with the old museum by a covered corridor, is, in its internal arrangements and decorations, one of the finest structures in the capital. The lowest of its three floors contains the Egyptian museum; on the first floor plaster casts of ancient, medieval and modern sculpture are found, while the second contains a cabinet of engravings. On the walls of the grand marble staircase, which rises to the full height of the building, Kaulbach's cyclus of stereorhomic pictures is painted, representing the six great epochs of human progress, from the confusion of tongues at the Tower of Babel and the dispersion of the nations to the Reformation.

The national gallery, a fine building surrounded by a Corinthian colonnade, adjoining on the south side of the Lustgarten, by the royal palaces and the Spree, contains a number of modern German paintings. Behind these buildings, again, is the Pergamum museum, which houses a unique collection, the result of the excavations at Pergamum. Still farther away, on a triangular plot of land enclosed by the two arms of the Spree and the metropolitan railway, stands the Kaiser Friedrich museum (1904). This edifice, in the Italian baroque style, surmounted by a dome, possesses but little architectural merit, and its position is so confined that great ingenuity had to be employed in its internal arrangement so as to meet the demands of space, but its collection of pictures is one of the finest in Europe. Hither were removed, from the old and new museums, the national gallery of pictures, the statuary of the Christian epoch and the numismatic collection. The gallery of paintings, on the first floor, is distributed into the separate schools of Germany, Italy, Flanders and Holland, while another of the central rooms embraces those of Spain, France and England. The collection, which in 1874 contained 1300 paintings, was then enriched by the purchase by the Prussian government for £51,000 of the Suerland collection, which, rich in pictures of the Dutch and Flemish schools, contained also a few by Spanish, Italian and French masters. The gallery as a whole has been happily arranged, and there are few great painters of whom it does not contain one or more examples. The Kunst-gewerbe museum, at the corner of the Königgrätzer-strasse and Albrecht-strasse, contains valuable specimens of applied art.

Theatres.—In nothing has the importance of Berlin become more conspicuous than in theatrical affairs. In addition to the old-established Opernhaus and Schauspielhaus, which are supported by the state, numerous private playhouses have been erected, notably the Lessing and the Deutschen theatres, and it is in these that the modern works by Wildenbruch, Sudermann, and Hauptmann have been produced, and it may be said that it is in Berlin that the modern school of German drama has its home. In music Berlin is not able to vie with Leipzig, Dresden or Munich, yet it is well represented by the Conservatorium, with which the name of Joachim is connected, while the modern school is represented by Xavier Scharwenka.

Government, Administration and Politics.—On the 1st of April 1881 Berlin was divided off from the province of Brandenburg and since forms a separate administrative district. But the chief presidency (Oberpräsidentum), the Consistory, the provincial school-board, and the board of health of the province of Brandenburg remain tribunals of last instance to which appeals lie from Berlin. The government is partly semi-military (police) and partly municipal. The ministry of police (a branch of the home office) consists of six departments: (1) general; (2) trade; (3) building; (4) criminal; (5) passports; (6) markets. It controls the fire brigade, has the general inspection over all strangers, and is responsible for public order. The civil authority (Magistrat) is headed by a mayor (Altstädtischer Bürgermeister), a council (Magistrat), and a city chief (Oberbürgermeister), or the chief (Bürgermeister), and a city council (Stadtverordnetensammlung) of 124 members, i.e. three delegates chosen by manhood suffrage for each ward of the city; but the election is subject to the veto of the king without reason given. The Stadtverordnetenamt consists of 32 members, of whom 15 are paid officials (including 2 syndics, 2 councilors for building, and 2 for education), while 17 serve gratuitously. For general work the Magistrat and the Stadtrat (Stadtverordnetensammlung) are responsible, and committees are appointed for various purposes out of the whole body, these being usually presided over by members of the Magistrat. Their jurisdiction extends to water-supply, the drainage, lighting and cleaning of the streets, the care of the poor, hospitals and schools. Politically the city is divided into six Reichstags and four Landtag constituencies, returning six and nine members respectively, and it must be noted that in the case of the Landtag the allocation of seats dated from 1860, so that the city, in proportion to its population, was in 1908 much under-represented. It should have had twenty-five members instead of nine.

Population.—The stupendous growth of the population of Berlin during the last century is best illustrated by the following figures. In 1816 it contained 197,717 inhabitants; in 1840,
BERLIN

431,566; in 1871, 836,341; in 1880, 1,122,330; 1890, 1,578,704, and in 1905, 2,033,900. The birth-rate is about 30, and the death-rate 20 per 1000 inhabitants a year. Illegitimate births amount to about 15% of the whole. According to religion, about 84% are Protestants, 10% Roman Catholics and 5% Jews, but owing to the great number of Jews who for social and other reasons consciously embrace the Christian faith, these last figures do not actually represent the number of Jews by descent living in the city.

Environs.—Marvellous as has been the transformation in the city itself, no less surprising results have been effected since 1875 in the surroundings of Berlin. On the east, north and west, the city is surrounded at a distance of some 5 m. from its centre by a thick belt of pine woods, the Jungfernheide, the Spandauer Forst, and the Grunewald, the last named stretching away in a south-westerly direction as far as Potsdam, and fringing the beautiful chain of Lakes and est. These forests enjoyed until quite recent times an unenviable notoriety as the camping-ground and lurking-place of footpads and other disorderly characters. After the opening of the circular railway in 1871, private enterprise set to work to develop these districts, and a "villa colony" was built at the edge of the Grunewald between the station West-end and the Spandauer Bock. From these beginnings, owing mainly to the expansion of the important suburb of Charlottenburg, has resulted a complete transformation of the eastern part of the Grunewald into a picturesque and delightful villa suburb, which is connected by railway, tramway and a magnificent boulevard—the Borsigstalstrasse—with the city. Nowadays the little fishing villages on the shores of the lakes, notably the Wannsee, cater for the recreation of the Berliners, while palatial summer residences of wealthy merchants occupy the most prominent sites. Suburban Berlin may be said to extend practically to Potsdam.

Traffic.—The public streets have a total length of about 350 m., and a large staff of workmen is regularly employed in maintaining and cleaning the public roads and parks. The force is well controlled, and the work of cleaning and removing snow after a heavy fall is thoroughly and efficiently carried out. The less important thoroughfares are mostly paved with the so-called Vienna paving, granite bricks of medium size, while the principal streets, and especially those upon which the traffic is heavy, have either asphalt or wood paving.

Water-Supply and Drainage.—The water-supply is mainly derived from works on the Müggel and Tegeler lakes, the river water being carefully filtered through sand. The drainage system is elaborate, and has stood the test of time. The city is divided into twelve radial systems, each with a pumping station, and the drainage is forced through five mains to eighteen sewage farms, one of which is under sanitary supervision—the Borsigstalstrasse, respect both of the persons employed thereon, and the products, mainly milk, passing thence to the city for human consumption. Only in a few isolated cases has any contamination been traced to fever or other zymotic germs. In this connexion it is worth noting that the infectious diseases hospital has a separate system of drainage which is carefully disinfected, and not allowed to be employed for the purposes of manure.

Hospitals.—In no other city of the world is the hospital organization so well appointed as in Berlin, or are the sick poor tended with greater solicitude. State, municipal and private charity here again join hands in the prompt relief of sickness and cases of urgency. The municipal hospitals are six in number, the largest of which is the Virchow hospital, situate in Moabit and opened in 1906. It is arranged on the pavilion system, contains 2000 beds, and is one of the most splendidly equipped hospitals in the world. The cost amounted to 5000,000. Next comes that of Friedrichshain, also built on the pavilion system, while the state controls six (not including the prison infirmaries) of which the world-renowned Charritò in the Luisen-strasse is the principal. The hospitals of the nursing sisters (Diasconissen Austalten) number 8, while there are 60 registered private hospitals under the superintendence of responsible doctors and under the inspection of government.

Charities.—Berlin is also very richly endowed with charitable institutions for the relief of pauperism and distress. In addition to the municipal support of the poor-houses there are large funds derived from bequests for the relief of the necessitous and deserving poor; while night shelters and people's kitchens have been organized on an extensive scale for the temporary relief of the indigent unemployed. For the former several of the arches of the city railway has been utilized, and correspond in internal arrangement to like shelters instituted by the Salvation Army in London and various other cities.

Markets.—Open market-places in Berlin are things of the past, and their place has been taken by airy and commodious market halls. Of these, 14 in number, the central market, close to the Alexander-platz station of the city railway with which it is connected by an admirable service of lifts for the rapid unloading of goods, is the finest. It has a ground area of about 17,000 sq. yds., and is fitted with more than 2000 stalls. The other markets are conveniently situated at various accessible places within the city, and the careful police supervision to which they are subjected, both in the matter of general cleanliness, and in the careful examination of all articles of food exposed for sale, has tended to the general health and comfort of the population.

The central cattle market and slaughter-houses for the inspection and supply of the fresh meat consumed in the metropolis occupy an extensive area in the north-east of the city on the Kühlschranke, upon which a station has been erected for the accommodation of meat trains and passengers attending the market. From the year 1344, only healthy animals and only carcases which have been stamped as having been certified good are permitted to be taken away for human consumption.

History.—The etymology of the word "Berlin" is doubtful. Some derive it from Celtic roots—ber, small, short, and lyn, a lake; others regard it as a Wend word, meaning a free, open place; others, again, refer it to the word wehr, a river island. Another authority derives it from the German word Bürhli, a marshy district, and the Slavonic termination "in; thus Bürhl, by the regular transmutation Bührn (compare Ger. brennen and Eng. burn), Bührlin. More recent research, however, seems to have established the derivation from Wehr, dam.

Similar obscurity rests on the origin of the city. The hypotheses which carried it back to the early years of the Christian era have been wholly abandoned. Even the margrave Albert the Bear (d. 1170) is no longer unquestioningly regarded as its founder, and the tendency of opinion now is to date its origin from the time of his great-grandsons, Otto III. and John I. When first alluded to, what is now Berlin was spoken of as two towns, Kölln and Berlin. The first authentic document concerning the former is from the year 1237, concerning the latter from the year 1244, and it is with these two documents that the history of the city begins. In 1307 the first attempt was made to combine the councils of Kölln and Berlin, but the experiment was abandoned four years later, and the two towns continued their separate existence till 1432, when the establishment of a common council for both led to disturbances of which the outcome was that Frederick II. the Iron in 1442 abolished this arrangement, seriously curtailing the privileges of both towns, and began the building of a castle at Kölln. A feud between the elector and the Berliners ended in the death of the latter, who was murdered forsooth in the church of St. Marien in 1442. From this time Berlin became and continued to be the residence of the Hohenzollerns, the elector John Cicer (1486-1490) being the first to establish a permanent court inside the walls. It was not, however, until the time of King Frederick William I. that the sovereigns ceased to date their official acts from Kölln. In 1539, under the elector Joachim II., Berlin embraced the Lutheran religion. Henceforth the history of Berlin was intimately bound up with the house of Hohenzollern. The conversion of the elector John Sigismund in 1613 to the Reformed (Calvinist) faith was hotly resisted by the Berliners and led to bloody riots in the city. The Thirty Years' War all but ruined the city, the population of which sank from some 14,000 in 1600 to less than 8000 in 1650. It was restored and the foundations of its modern
spleNdor were laid by the great Elector, by the time of whose death (1688) the population had risen to some 20,000. During this period several suburbs had begun to grow up, Friedrichsweder in 1667 and the Dorotheenstadt, so named in 1670 after the electress Dorothea its founder. In 1688 Frederick III. (afterwards King Frederick I.) began the Friedrichswerder, completely combining it with Berlins I. He had much to embellish the city as the royal Residenstadt, the separate administrations of the quarters of Berlin, Kölln, Friedrichswedder and Dorotheenstadt were combined, and the separate names were absorbed in that of Berlin. The fortifications begun in 1689 were finally demolished under Frederick the Great in 1745, and the Neue Friedrichstrasse, the Alexander-strasse and the Wall-strasse were laid out on their site.

During the Seven Years' War Berlin was attacked by the enemy: in 1757 by the Austrians, who penetrated into the suburbs and levied a heavy contribution, and in 1760 by the Russians, who bombarded the city, penetrated into it, and only retired on payment of a ransom of 1,500,000 thalers (£225,000). After the disastrous campaign of Jena, Berlin suffered much during the French occupation (24th October 1806 to 1st December 1808). In spite of these misfortunes, however, the progress of the city was steady. In 1809 the present municipal government was instituted. In 1810 the university was founded. After the division of Prussia and Russia in 1812 Berlin was again occupied by the French, but in March 1813 they were finally driven out. The period following the close of the war saw great activity in building, especially in the erection of many noble monuments and public buildings, e.g. those by the architect Karl Friedrich Schinkel. The most notable event in the history of Berlin during the 19th century, prior to the Franco-German War, was the March revolution of 1848 (see GERMANY: History, and FREDERICK WILLIAM IV., king of Prussia). The effect of the war of 1870-71 on the growth of Berlin has been sufficiently indicated already.

Authorities.—For the history of Berlin see the publications of the "Verein für die Geschichte Berlins"; the "Berlinerische Chronik nebst Urkundbuche", and the periodicals Der Bär (1875, &c.) and Mitteilungen (1884, &c.). Of histories may be mentioned A. Streckfuss, 500 Jahre Berliner Geschichte (new ed. by Fernbach, 1900); Berlin im 19ten Jahrhundert (4 vols., 1867-1869); and Statistisches Jahrbuch der Stadt Berlin (1893-1905); Fidicin, Historisch-diplomatiche Beiträge zur Geschichte der Stadt Berlin (5 vols. 1886-1891); Brochhaus, Konversations-Lexikon (1904); Meyer, Konversations-Lexikon (1904); Baedeker, Führer durch Berlin; Wocri, Führer durch Berlin; J. Pollari, The Corporation of Berlin (Edinburgh, 1863); A. Shadwell, Industrial Efficiency (London, 1906); Berliner Jahrbuch für Handel und Industrie (1905); and O. Schwebel, Geschichte der Stadt Berlin (Berlin, 1888). (P. A. A.)

BERLIN, CONGRESS AND TREATY OF. The events that led up to the assembling of the congress of the league of Berlin, the outcome of which was the treaty of the 13th of July 1878, are described elsewhere (see Europe: History, Turkey: History, Russo-Turkish War). Here it must suffice to say that the terms of the treaty of San Stefano (3rd March 1878), by which the Russo-Turkish War had been brought to a conclusion, seemed to those of the other powers who were most interested scarcely less fatal to the Ottoman dominion than that Russian occupation of Constantiopol which Great Britain had risked a war to prevent. By this instrument Bulgaria was to become a practically independent state, under the nominal suzerainty of the sultan, bounded by the Danube, the Black Sea, the Aegean and Albania, and cutting off the latter from the remnant of Rumelia which, with Constantinople, was to be left to the Turks. At the same time the other Christian principalities, Servia and Montenegro, were largely increased in size and their independence definitively recognised; and the proposals of the powers with regard to Bosnia and Herzegovina, communicated to the Ottoman plenipotentiaries at the first sitting of the conference of Constantiopol (23rd December 1876), were to be immediately executed. These provisions seemed to make Russia permanently arbiter of the fate of the Balkan peninsula, the more so since the vast war indemnity of 1,400,000,000 roubles exacted in the treaty promised to cripple the resources of the Ottoman government for years to come.

The two powers whose interests were most immediately threatened by the terms of the peace were Austria and Great Britain. The former especially, refusing to be bribed by the "essential offer of Bosnia and Herzegovina," saw herself cut off from all chance of expansion in the Balkan peninsula and threatened with the establishment therewith of the paramount power of Russia, a peril it had been her traditional policy to avert. On the 5th of February, accordingly, Count Andrassy issued a circular note, addressed to the signatory powers of the treaty of Paris of 1856 and the London protocol of 1871, suggesting a congress for the purpose of establishing "the agreement of Europe on the modifications which it may become necessary to introduce into the above-mentioned treaties" in view of the preliminaries of peace signed by Russia and Turkey. So far as appeal to the sanctity of international engagements, traditional in the diplomatic annals of Austria, and strengthened by so recent a precedent as that of 1871, met with an immediate response. On the 1st of April Lord Salisbury had already addressed a circular note to the British embassies refusing on behalf of the British government to recognize any arrangements made in the peace preliminaries, calculated to modify European treaties, "unless they were made the subject of a formal agreement among the parties to the treaty of Paris," and quoting the "essential offer of the law of nations," promulgated in 1756, or the London protocol. By Great Britain therefore the Austrian proposal was at once accepted. Germany was very willing to fall in with the views of her Austrian ally and share in a council in which, having no immediate interests of her own, Bismarck could win new laurels in his rôle of "honest broker." In these circumstances Russia could not but accept the principle of a congress. She tried, however, to limit the scope of its powers by suggesting the exclusion of certain clauses of the treaty from its reference, and pointed out (circular of Prince Gorchakov, 14th May) that Russia had not been the first nor the only Power to violate the treaties in question. The answer of Lord Beaconsfield was to mobilize the militia and bring Indian troops to the Mediterranean; and finally Russia, finding that the diplomatic support which she had expected from Bismarck failed her, consented to submit the whole treaty without reserve to the congress.

On the 3rd of June Count Münster, in the name of the German government, issued the formal invitation to the congress. The congress met, under the presidency of Prince Bismarck, at Berlin on the 13th of June. Great Britain was represented by Lord Beaconsfield, Lord Salisbury and Lord Odo Russell, ambassador at Berlin; Germany by Prince Bismarck, Baron Ernst von Bülow and Prince Chlodwig von Hohenlohe-Schillingsfürst, ambassador at Paris; Austria by Count Andrassy, Count Louis Károlyi and Baron Heinrich Karl von Haymerle, ambassador at Rome; France by William H. Waddington, the Comte de Saint-Vallier, ambassador at Berlin, and Félix Hippolyte Desprez, director of political affairs in the department for foreign affairs; Russia by the chancellor, Prince Gorchakov, Count Peter Shuvalov, ambassador to the court of St. James's, and Paul d'Oubril, ambassador at Berlin; Turkey by Alexander Catheodory Pasha, minister of public works, Ali Pasha, mashir of the Ottoman armies, and Sadullah Bey, ambassador at Berlin. The bases of the conferences had, of course, been settled beforehand, and the final act of the congress was signed by the plenipotentiaries mentioned above exactly a month after the opening of the congress, on the 13th of July.

The treaty of Berlin consists in all of sixty-four articles, of which it will be sufficient to note those which have had a special bearing on subsequent international developments. So far as they affect the territorial boundaries fixed by the treaties of Paris and San Stefano it will be sufficient to refer to the sketch map in the article Europe: History. By Art. I. Bulgaria was "constituted an autonomous and tributary principality under the suzerainty of H.I.M. the Sultan"; it was to have "a Christian government and a national militia." Art. II. fixed
the boundaries of the new state and provided for their delimitation by a European commission, which was "to take into consideration the necessity for H.I.M. the Sultan to be able to defend the Balkan frontiers of Eastern Rumelia." Arts. III. to XII. provide for the election of a prince for Bulgaria, the machinery for settling the new constitution, the adjustment of the relations of the new Bulgarian government to the Ottoman Empire and its subjects (including the question of tribute, the amount of which was, according to Art. XII., to be settled by agreement of the signatory powers "at the close of the first year of the working of the new organization"). By Art. X. Bulgaria, so far as it was concerned, was to take the place of the Sublime Porte in the engagements which the latter had contracted, as well towards Austria-Hungary as towards the Rustchuk-Varna Railway Company, for working the railway of European Turkey in respect to the completion and connexion, as well as the working of the railways situated in its territory.

By Art. XIII. a province was formed south of the Balkans which was to take the name of "Eastern Rumelia," and was to remain "under the direct military and political control of H.I.M. the Sultan, under conditions of administrative autonomy." It was to have a Christian governor-general. Arts. XIV. to XXIII. define the frontiers and organization of the new province, questions arising out of the Russian occupation, and the rights of the Sultan. Of the latter it is to be noted that the Sultan retained the right of fortifying and occupying the Balkan passes (Art. XV.) and all his rights and obligations over the railways (Art. XVI.).

Art. XXV., which sets the events of 1806 afterwards brought into special prominence, runs as follows: "The provinces of Bosnia and Herzegovina shall be occupied and administered by Austria-Hungary. The government of Austria-Hungary, not desiring to undertake the administration of the sanjak of Novi-Bazar, the Ottoman administration will continue to exercise its functions there. Nevertheless, in order to assure the maintenance of the new political state of affairs, as well as freedom and security of communications, Austria-Hungary reserves the right of keeping garrisons and having military and commercial roads in the Archives of this part of the ancient vilayet of Bosnia."

By Art. XXVI. the independence of Montenegro was definitively recognized, and by Art. XVIII. she received certain accessions of territory, including a strip of coast on the Adriatic, but under conditions which tended to place her under the tutelage of Austria-Hungary. Thus, by Art. XXXIX. she was to have neither ships of war nor a war flag, the port of Antivari and all Montenegrin waters were to be closed to the war-ships of all nations; the fortifications between the lake and the coast were to be razed; the administration of the maritime and sanitary police at Antivari and along the Montenegrin littoral was to be carried on by Austria-Hungary "by means of light coast-guard boats"; Montenegro was to adopt the maritime code in force in Dalmatia, while the Montenegrin merchant flag was to be under Austro-Hungarian consular protection. Finally, Montenegro was to "come to an understanding with Austria-Hungary on the right to construct and keep up across the new Montenegrin territory a road and a railway."

By Art. XXXIV. the independence of Servia was recognized, subject to conditions (as to religious liberty, &c.) set forth in Art. XXXV. Art. XXXVI. defined the new boundaries.

By Art. XLII. the independence of Rumania, already proclaimed by the prince (May 22, June 3, 1877), was recognized. Subsequent articles define the conditions and the boundaries.

Arts. LII. to LVII. deal with the question of the free navigation of the Danube. All fortifications between the mouths and the Iron Gates were to be razed, and no vessels of war, save those of light tonnage in the service of the river police and the customs, were to navigate the river below the Iron Gates (Art. LIV.). The Danube Commission, which Rumania was to be represented, was maintained in its functions (Art. LIII.) and provision made for the further prolongation of its powers (Art. LIV.).

Art. LVIII. cedes to Russia the territories of Ardahan, Kars and Batoum, in Asiatic Turkey. By Art. LIX. "H.M. the emperor of Russia declares that it is his intention to constitute Batoum a free port, essentially commercial."

By Art. LXI. "the Sublime Porte undertakes to carry out, without further delay, the improvements and reforms demanded by local requirements in the provinces, inhabited by the Armenians, and to guarantee their security against the Circassians and Kurds." It was to keep the powers informed periodically of "the steps taken to this effect."

Art. LXII. made provision for the securing religious liberty in the Ottoman dominions.

Finally, Art. LXIII. declares that "the treaty of Paris of 30th March 1856, as well as the treaty of London of 13th March 1871, are maintained in all such of their provisions as are not abrogated or modified by the preceding stipulations."

For the full text of the treaty, in the English translation see E. Herxst, Map of Europe by Treaty, vol. iv. p. 2759 (No. 530); for the French original see State Papers, vol. ix. p. 749. (W.A.P.)

BERLIN, a city of Coos county, New Hampshire, U.S.A., on the Androscoggin river, in the N. part of the state, about 98 m. N.W. of Portland, Maine. Pop. (1890) 3729; (1900) 8886, of whom 4613 were foreign-born; (1910 census) 11,750. The area of the city in 1906 was 57-81 sq. m. Berlin is served by the Grand Trunk and Boston & Maine railways. It is situated in the heart of the White Mountains and 16 m. from the base of Mt. Washington. Berlin Falls, on the picturesque Androscoggin river, furnishes an immense water-power, the development of which for manufacturing purposes accounts for the rapid growth of the city. The forests of northern New England and of the province of Quebec supply the raw material for the extensive saw-mills and planing-mills, the pulp- and paper-mills, and the sulphite fibre mills, said to be the largest in existence. In 1905 the city's factory products were valued at $5,089,119, of which 78-5% was the value of the paper and wood pulp manufactured. Berlin was first settled in 1821, was incorporated as a township in 1840, and was chartered as a city in 1857.

BERLIN, a city, port of entry, Ontario, Canada, and capital of Waterloo county, 58 m. W. of Toronto, on the Grand Trunk railway. It is the centre of a prosperous farming and manufacturing district, inhabited chiefly by German immigrants and their descendants. An electric railway connects it with the town of Waterloo (pop. 4100) 2 m. to the north, which has important flour and woolen mills and distilleries. Berlin is a flourishing manufacturing town, and contains a beet sugar refinery, automobile, leather, furniture, shirt and collar, felt, glove, button and rubber factories. Pop. (1881) 4054; (1901) 9787.

BERLIN, a four-wheeled carriage with a separate hooded seat behind, detached from the body of the vehicle; so called from having been first used in Berlin. It was designed about 1670, by a Piedmontese architect in the service of the clector of Brandenburg. It was used as a travelling carriage, and Swift refers to it in his advice to authors "who scribble in a berlin." As an adjective, the word is used to indicate a special kind of goods, originally made in Berlin, of which the best known is Berlin wool. A Berlin warehouse is a shop for the sale of wools and fancy goods (cf. Italian warehose). The spelling "berlin" is also used by Sir Walter Scott for the "birfeln," a large Gaelic rowing-boat.

BERLIOZ, Hector (1803-1869), French musical composer, was born on the 11th of December 1803 at Côte-Saint-André, a small town near Grenoble, in the department of Isère. His father, Louis Berlioz, was a physician of repute, and by his desire Hector for some time devoted himself to the study of medicine. At the same time he had music lessons, and, in secret, perused numerous theoretical works on counterpoint and harmony, with little profit it seems, till the hearing and subsequent careful analysis of one of Haydn's quartets opened a new vista to his unguided aspirations. A similar work written by Berlioz in imitation of Haydn's masterpiece was favorably received by his friends. From Paris, where he had been sent to complete his
BERLIOZ

medical studies, he at last made known to his father the unalterable decision of devoting himself entirely to art, the answer to which confession was the withdrawal of all further pecuniary assistance. In order to support life Berlioz had to accept the humble engagement of a singer in the chorus of the Gymnase theatre. Soon, however, he became reconciled to his father and entered the Conservatoire, where he studied composition under Reicha and Lesueur. His first important composition was an opera called Les Francs-Juges, of which, however, only the overture remains extant. In 1825 he left the Conservatoire, and began a course of self-education, founded chiefly on the works of Beethoven, Gluck, Weber and other German masters. About this period he also saw form for the first time the talented Irish actress Henrietta Smithson, who was then charming Paris by her impersonations of Ophelia, Juliet and other Shakespearean characters. The enthusiastic young composer became deeply enamoured of her at first sight, and tried, for a long time in vain, to gain the love or even the attention of his idol. To an incident of this wild and persevering courtship Berlioz's first symphonic work, Épisode de la vie d'un artiste, owes its origin. By the advice of his friends Berlioz once more entered the Conservatoire, where, after several unsuccessful attempts, his cantata Sardanapalus gained him third (the prize for the best work of the year) of the three perpetual antagonism of one of the umpires. During a stay in Italy Berlioz composed an overture to King Lear, and Le Retour à la vie—à sort of symphony, with interposing poetical declaration between the single movements, called by the composer a melodogue, and written in continuation of the Épisode de la vie d'un artiste, along with which work it was performed at the Paris Conservatoire in 1832. Pagani on that occasion spoke to Berlioz the memorable words: "Vous commencez par ou les autres ont fini." Miss Smithson, who also was present on the occasion, consented to become the wife of her ardent lover in 1834. The marriage was a tempestuous mistake. In 1840 he separated from his wife, who died in 1854. Six months later Berlioz married Mademoiselle Récluz. His second wife did not live very long, nor was there much that was edifying in this marriage. Between the date of his first marriage and 1840 came out his dramatic symphonies Harold en Italie, Funèbre et triomphale, and Roméo et Juliette; his opera Benvenuto Cellini (1837); his Requiem, and other works. In the course of time Berlioz won his due share of the distinctions generally awarded to artistic merit, such as the ribbon of the Legion of Honour and the cross of the Order of the Legion of Honour. But he never coveted, perhaps, less to a genuine admiration of his compositions than to his successes abroad and his influential position as the musical critic of the Journal des Débats (a position which he held from 1838 to 1864, and which he never used or abused to push his own works). In 1842 Berlioz went for the first time to Germany, where he was hailed with welcome by the leading musicians of the younger generation, Robert Schumann foremost amongst them. The latter paved the way for the French composer's success by a comprehensive analysis of the Épisode in his musical journal, the Neue Zeitchrift für Musik. In 1846 he produced his magnificent cantata La Damnation de Faust. Berlioz gave successful concerts at Leipzig and other German cities, and repeated his visit on various later occasions—in 1852 by invitation of Liszt, to conduct his opera, Benvenuto Cellini (kissed off the stage in Paris), at Weimar; and in 1855 to produce his oratorio-trilogy, L'Enfance du Christ, in the same city. This latter work had been previously performed at Paris, where Berlioz mystified the critics by pretending to have found the last chorus amongst the manuscript scores of a composer of the name of Beethoven, the composer usually being called by name. In 1855 his Te Deum was written for the opening of the Paris exhibition. Berlioz also made journeys to Vienna (1866) and St Petersburg (1867), where his works were received with great enthusiasm. In 1861 he produced his work Boutrice et Bénédicé, and in 1863 Les Troyens. He died in Paris on the 8th of March 1869.

It is not only as a composer that the life of Berlioz is full of interest, although in this respect his achievement is singularly significant for the comprehension of the modern spirit in music. But it is as the symbol of 'French romanticism in the whole domain of aesthetic perception that his pre-eminence has come to be recognized. His Mémoires (began in London in 1845 and finished in 1865) illustrate this romantic spirit at its highest elevation as well as at its lowest depths. Victor Hugo was a romantic, Musset was a romantic, but Berlioz was romanticism itself. As a boy he is in despair over the despair of Dido, and his breath is taken away at Virgil's "Quasivit coelo lucem ingemuitique reperta." At the age of twelve he is in love with "Estelle," whom he meets fifty years afterwards. The scene is described by himself (1865) with minute fidelity—a scene which Flaubert must have known by heart when he wrote its parallel in the novel Vinte Jardines (1869). The scene between this meeting between the man—old, isolated, unspeakably sad, with the halo of public fame burning round him—and the woman—old also, a mother, a widow, whose beauty he had worshipped when she was eighteen—is striking. In a frame of castenched melancholy and joy at the sight of Estelle, Berlioz goes to dine with Patti and her family. Patti, on the threshold of her career, pets Berlioz with such uncontrollable affection, that as the composer wrote a description of his feelings he was overwhelmed at the bitterness of fate. What would he not do for Estelle, he wrote, if she were only his! Here is a passage to him like a marvellous bird with diamond wings flitting round his head, resting on his shoulder, plucking his hair and singing her most joyous songs to the accompaniment of beating wings. "I was enchanted but not moved. The fact is that the young, beautiful, dazzling, famous virtuoso who at the age of twenty-two has already seen musical Europe and America at her feet, does not win the power of love in me; and the aged woman, sad, obscure, ignorant of art, possesses my soul as she did in the days gone by, as she will do until my last days!" If this episode touches the sublime, it may be urged with almost equal truth that his description of the exhumation of his two wives and their refusal in a single tomb touches the ridiculous. And yet the scene is described with a perception of all the detail which would call for the highest praise in a novelist. Perhaps some parallel between the splendid and the ridiculous in this singular figure may be seen in the comparison of Nadar's caricature with Charpentier's portrait of the composer.

The profound admiration of Berlioz for Shakespeare, which rose at moments to such a pitch of folly that he set Shakespeare in the place of God and worshipped him, cannot be explained simply by a devotion to the English drama, but by the fact that Shakespeare in his world of imagination and fancy was the only great Italian actress. Unquestionably the great figures in English literature had a profound attraction for him, and while the romantic spirit is obvious in his selections from Byron and Scott, it can also be traced in the quality of his enthusiasm for Shakespeare. It is in his music more than in his literary attitude, however, that is disclosed something in addition to the pure romance of Schumann—something that places him nearer in kind to Wagner, who recognized in him a composer from whose works he might learn something useful for the cultivation of his own ideals. As a youth the power of Beethoven's symphonies made a deep impression on Berlioz, and what has been described as the "poetical idea" in Beethoven's creations ran riot in the young medical student's mind. He thus became one of the most ardent and enlightened originators of what is now known as 'programme music.' Technically he was a brilliant musical colourist, often extravagant, but with the extravagant emotionalism of genius. He was a master of the orchestra; indeed, his treatment of the orchestra and his invention of unprecedented effects of 'timbre' gave him a solitary position in musical history; he had an extraordinary gift for the use of the various instrumental effects, and himself propounded a new ideal for the force to be employed, on an enormous scale.

His literary works include the Traité d'instrumentation (1844); Voyage musical en Allemagne et en Italie (1845); Les Soirées d'orchestre (1853); Les Grotesques de la musique (1859); A travers chant (1862); Mémoires (1870); Lettres intimes (1882). For a full list of his musical works, Grove's Dictionary should be consulted.

Adolph Julien's biography of Berlioz (1888) first gave a careful account of the details of his life. See also the books by R. Poli (1884), P. Galibert (1890), E. Hippueau (1890), G. Nouillard (1885), L. Mesnard (1888), Louise Pohol (1900), and D. Bernard (trans. by H. M. Dunstan, 1888). An illuminating essay on Berlioz is in Filsom Young's Masteringers (1902). See also the essay in W. H. Hadow's Studies in Modern Music (1st series, 1908). Berlioz's Traité d'Instrumentation has been translated into German and brought up to date by Richard Strauss (2nd edition 1909).

BERM (probably a variant of "brim"), a narrow ledge of ground, generally the level banks of a river. In parts of Egypt the term is applied to the Nile, included in the width. Thus the lands near Berber, Mr C. Dupuis writes (in Sir William Garstin's Report on the Upper Nile, 1904), "In most places there is a well-defined alluvial herm of recent formation and varying width, up to perhaps a couple of kilometres." In military phrancology the berm is the space of ground between the base of a rampart and the ditch.

BERMONDSY, a south-eastern metropolitan borough of London, England, bounded N. and E. by the Thames, S.E. by Deptford, S.W. by Camberwell, and W. by Southwark. Pop. (1901) 136,075. It is a district of poor streets, inhabited by a labouring population employed in leather and sister factories, and in the Surrey Commercial Docks and the wharves bordering the river. The parish of Rotherhithe or Redriff has long been associated with a seafaring population. A tunnel connecting it with the opposite shore of the river was opened in June 1898. The neighbouring Thames tunnel was opened in 1843, but, as the tolls were insufficient to maintain it, it was sold to the East London Railway Company in 1865. The Herold Institute, a branch of the Borough Polytechnic, Southwark, is devoted to instruction in connexion with the leather trade. Southwark Park is in the borough. Bermondsey is in the parliamentary borough of Southwark, including the whole of Rotherhithe and part of the Bermondsey division. The borough council consists of a mayor, 9 aldermen, and 54 councillors. Area 1,496-6 acres.

The name appears in Domesday, the suffix designating the former insular, marshy character of the district; while the prefix is generally taken to indicate the name of a Saxon overlord, Berumund. Bermondsey was in favour with the Norman kings as a place of residence, and there was a palace here, perhaps from pre-Norman times. A Cluniaic monastery was founded in 1036 by Ethelweard, Bishop of St Albans, and the abbey church of St Olave, Tooley Street, was formed on the site of the monastery. The foundation was erected into an abbey in 1369, and Abbey Road recalls its site. Similarly, Spa Road points to the existence of a popular spring and pleasure grounds, maintained for some years at the close of the 18th century. Jacob Street marks Jacob's Island, the scene of the death of Bill Sikes in Dickens'sOliver Twist. Tooley Street, leading east from Southwark by London Bridge railway station, is well known in connexion with the story of three tailors of Tooley Street, who addressed a petition to parliament opening with the comprehensive expression: We, the people of England. The name is a corruption of St Olave, or Olaf, the Christian king of Norway, who in 994 attacked London by way of the river, and broke down London Bridge.

See E. T. Clarke, Bermondsey, its Historic Memories (1901).

BERMUDAS. A group of islands in the Atlantic Ocean, forming a British colony, in 32° 15′ N. and 64° 30′ W., about 580 m. S. from Cape Hatteras on the American coast. The group, consisting of small islands and reefs (which mark the extreme northern range of the coral-building polyps), is of oval form, measuring 22 m. from N.E. to S.W., the area being 20 sq. m. The largest of the islands is Green, Bermuda, and the Main Island is 14 m. long and about a mile in average width, enclosing on the east Harrington or Little Sound, and on the west the Great Sound, which is thickly studded with islets, and protected on the north by the islands of Watford, Boaz, Ireland and Somerset. The remaining members of the group, St George, Paget, Smith, St David, Cooper, Nonsuch, etc., lie N.E. of the Main Island, and form a semicircle round Castle Harbour. The fringing islands which encircle the islands, especially on the north and west, leave a few deep passages wide enough to admit the largest vessels.

Geology.—The Bermudas consist of aeolian limestones (cf. Bahamas) which in some of the larger islands form irregular hills attaining a height of some 200-250 ft. These limestones are composed chiefly of comminuted shells drifted and deposited by the wind, and they are very irregularly stratified, as is usually the case with wind-blown deposits. Where fresh the rock is soft, but where it has been exposed to the action of the sea it is covered by a hard crust and often loses all trace of stratification. The surface is frequently irregularly honeycombed. Even the reefs are not wholly formed of coral. They are ridges of aeolian lime-
stone cemented over the years, and any more firmly with organisms. The very remarkable "serpuline stools" are covered by a solid crust made of the convoluted tubes of serpulidae and Vermulus, together with barnacles, mussels, nippoliphs, corallines and some true incrusting corals. They probably rest upon a foundation of aeolian rock. The Bermudas were formerly much more extensive than at present, and they may possibly stand upon the summit of a hidden volcano. There are evidences of small oscillations of levels, but no proofs of great elevation or depression.

Soil, Climate, etc.—The surface soil is a curious kind of red earth, which is also found in ochre-like strata throughout the limestone. It is generally mixed with vegetable matter and coal sand. There is a total want of streams and wells of fresh water, and the inhabitants are dependent on the rain, which they collect and preserve in tanks. The climate is mild and healthy, although serious epidemics of yellow fever and typhus have occurred. The maximum reading of the thermometer is about 85° F. and its minimum 49°, the mean annual temperature being 70°. The islands attract a large number of visitors annually from America. Vegetation is very rapid, and the soil is clad in a very dense and almost perpetual green. The principal kind of tree is the so-called Bermuda cedar, really a species of juniper, which furnishes timber for small vessels. The shores are fringed with the mangrove; the prickly pear grows luxuriantly in the most barren districts; and wherever the ground is left to itself the sage bushes spring up profusely. The citrus, sour orange, lemon and lime grow wild; but the apple and peach do not come to perfection. The loquat, an introduction from China, thrives admirably. The mild climate assists the growth of esculent plants and roots; and a considerable trade is carried on between Bermuda and colonies in America for potatoes, turnips, tomatoes, beetroot, together with lily bulbs, cut flowers and some arrowroot. Medicinal plants, as the castor-oil plant and aloe, come to perfection without culture; and coffee, indigo, cotton and tobacco are also of spontaneous growth. Few oxen or sheep are reared in the colony, meat, as well as bread and most vegetables, being imported from America. The indigenous mammals are very few, and the only reptiles are a small lizard and the green turtle. Birds, however, especially aquatic species, are very numerous. Insects are comparatively few, but ants in warm destructively in the heat of the year. Fish are plentiful round the coast, and the whale-fishery was once an important industry, but the fisheries as a whole have not been developed.

Towns, and Administration.—There are two towns in the Bermudas: St George, on the island of that name, founded in
BERMUDA—BERN

1794 and incorporated in 1797; and Hamilton, on the Main Island, founded in 1790 and incorporated in 1793. St George was the capital till the senate and courts of justice were removed by Sir James Cockburn to Hamilton, the first being centrally situated, he is the present seat. Hamilton, which is situated on the inner part of the Great Sound, had a population in 1901 of 2246, that of St George being 985. In Ireland Island is situated the royal dockyard and naval establishment. The harbour of St George’s has space enough to accommodate a vast fleet; yet, till deepened by blasting, the entrance was so narrow as to render it almost useless. The Bermudas became an important naval and coaling station in 1869, when a large iron dry dock was towed across the Atlantic and placed in a secure position in St George, while, owing to its strategic position as a base, the British government maintains a strong garrison. The Bermudas are a British crown colony, with a governor resident at Hamilton, who is assisted by an executive council of 6 members appointed by the crown, a legislative council of 9 similarly appointed, and a representative assembly of 36 members, of whom four are returned by each of nine parishes. The currency of the colony, which had formerly twelve shillings to the pound sterling, was assimilated to that of England in 1842. The English language is universal. The colony is ecclesiastically attached to the Church of England, and a church college for the training of clergymen was established, and there are numerous schools. A liberal education is compulsory, but none of the schools is free. Government scholarships enable youths to be educated for competition in the Rhodes scholarships to Oxford University. The revenue of the islands shows a fairly regular increase during the last years of the 19th and the first of the 20th, as from £37,830 in 1895 to £63,457 in 1904; expenditure is normally rather less than revenue. In the year last named imports were valued at £589,979 and exports at £305,305, the annual averages since 1895 being about £296,350 and £112,500 respectively. The population shows a steady increase, as from 13,048 in 1877 to 17,553 in 1901; 6383 were whites and 11,152 coloured in the latter year.

History.—The discovery of the Bermudas resulted from the shipwreck of Juan Bermudez, a Spaniard (whose name they now bear), when on a voyage from Spain to Cuba with a cargo of hogs, early in the 16th century. Henry May, an Englishman, suffered the same fate in 1513; and lastly, Sir George Somers shared the destiny of the two preceding navigators in 1609. Sir George, from whom the islands took the alternative name of Somers, was the first to establish a settlement upon the island, which he died before he had fully accomplished his design. In 1612 the Bermudas were granted to an offshoot of the Virginia Company, which consisted of 120 persons, 60 of whom, under the command of Henry More, proceeded to the islands. The first source of colonial wealth was the growing of tobacco, but the curing industry ceased early in the 18th century. In 1768 Bishop George Berkeley chose the Bermudas as the seat of his projected missionary establishment. The first newspaper, the Bermudian Gazette, was published in 1784.

BERMUEZ, a N.E. state of Venezuela, between the Caribbean Sea and the Orinoco river, bounded E. by the gulf of Paria and the British deposits, W. by the states of Guaro and Miranda. Pop. (est. 1900) 81,158. It was created by an union of the states of Barcelona, Cumaná and Maturín, dissolved in 1901 into its three original states, and reorganized in 1904 with a slight modification of territory. The state includes the oldest settlements in Venezuela, and was once very prosperous, producing cattle and exporting hides, but wars and political disorders have partly destroyed its industries and impeded their development. Its principal productions are coffee, sugar, and cacao, and—less important—cotton, tobacco, coconuts, timber, indigo and dyewoods. Its more important towns are the capital, Barcelona, and Maturín (pop. 14,473), capital of a district of the same name, and Cumaná (10,000), on the coast of Cariaco, founded in 1526 and one of the oldest towns of the continent.

BERN (Fr. Berne), after the Grisons, the largest of the Swiss cantons, but by far the most populous, though politically Bern ranks after that of Zürich. It extends right across Switzerland from beyond the Jura to the snow-clad ranges that separate Bern from the Valais. Its total area is 2641 sq. m., of which 2081 sq. m. are classed as “productive” (including 591 sq. m. of forests, and 211 m. of vineyards) while of the remainder 123 sq. m. are occupied by glaciers (the Valais and the Grisons alone surpass it in this respect). It is mainly watered by the river Aar (q.v.), with its affluents, the Kander (left), the Saane or Sarine (left) and the Emme (right); the Aar forms the two lakes of Brienz and Thun (q.v.). The great extent of this canton accounts for the different character of the regions therein comprised. Three are usually distinguished:—(1) The Oberland or Highlands, which is that best known to travellers, for it includes the snowy Alps of the Bernese Oberland (cultivating in the Finsteraarhorn, 14,026 ft., and the Jungfrau, 13,660 ft., as well as many of the finest summer resorts and the most famous summer seat of the university. (2) The Mittelland or Midlands, comprising the valley of the Aar below Thun, and that of the Emme, thus taking in the outliers of the high Alps and the open country on every side of the town of Bern. (3) The Sedan (Lakeland) and the Jura, extending from Bienna and its lake across the Jura to Porrentruy in the plains and to the upper course of the Birs. The Oberland and Mittelland form the “old” canton, the Jura having only been acquired in 1815, and belonging from the rest of the canton by reason of its French-speaking and Romanist inhabitants.

In 1890 the total population of the canton was 580,433, of whom 483,388 were German-speaking, 97,789 French-speaking, and 7176 Italian-speaking; while there were 506,609 Protestants, 80,480 Romanists (including the Old Catholics), and 1543 Jews. The capital is Bern (q.v.), while the other important towns are Bienna (q.v.), Burgdorf (q.v.), Delémont or Delsberg (5053 inhabitants), Porrentruy or Pruntrut (6959 inhabitants), Thun (q.v.), and Langenthal (4799 inhabitants). There is a university at Bern, named in 1834 in honour of Bern, as well as institutions for higher education in the principal towns. The canton is divided into 30 administrative districts, and contains 507 communes (the highest number in Switzerland). From 1803 to 1814 the canton was one of the six “Directorial” cantons of the Confederation. The existing cantonal constitution dates from 1893, but in 1906 the direct popular election of the executive of 9 members (hitherto named by the legislature) was introduced. The legislature or Grossrath is elected for four years (like the executive), in the proportion of 1 member to every 2500 (or fraction over 1250) of the resident population. The obligatory Referendariats obtain in the case of all laws, and of decrees relating to an expenditure of over half a million francs, while 12,000 citizens have the right of initiative in the case of legislative projects, and 15,000 may demand the revision of the cantonal constitution. The 2 members sent by the canton to the federal Ständerath are elected by the Grossrath, while the 20 members sent to the federal Nationalrath are chosen by a popular vote. In the Alpine portions of the canton the breeding of cattle (those of the Simme valley are particularly famous) is the chief industry; next come the elaborate arrangements for summer travellers (the famous “Fremdenindustrie”). It is reckoned that there are at least 2430 “Alps” or mountain pastures in the canton, of which 1474 are in the Oberland, 627 in the Jura, and 286 in the Emme valley; they can maintain 95,478 cows and are of the estimated value of 461 million francs. The cheese of the Emme valley is locally much esteemed. Other industries in the Alpine region are wood-carving (at Brienz) and wine manufacture (on the shores
of the lakes of Bienne and of Thun). The Mittelland is the agricultural portion of the canton. Watchmaking is the principal industry of the Jura, Bienne and St. Imier being the chief centres of this industry. Iron mines are also worked in the Jura, while the Heimberg potteries, near Thun, produce a locally famous ware, and there are both quarries of building stone and tile factories. The canton is well supplied with railway lines, the broad gauge lines being 228 m. in length, and the narrow gauge lines 157½ m.—in all 385 m. Among these are many funicular cog-wheel lines, climbing up to considerable heights, so up to Mürren (568½ ft.), over the Wengen Alp (6772 ft.), up to the Schynige Platte (6563 ft.), and many others still in the state of projects. All these are in the Oberland where, too, is the so-called Jura industry, which is practically auctions of raw materials and the Eisener station in the south wall of the Eiger (13,042 ft.) that was 10,371 ft. in height, the loftiest railway station in Switzerland.

The canton of Bern is composed of the various districts which the town of Bern acquired by conquest or by purchase in the course of time. The more important, with dates of acquisition, are the following:—Laupen (1324), Hasli and Meleningen (1334), Thun and Burgdorf (1384), Unterseen and the Upper Simme valley (1386), Frutigen, &c. (1400), Lower Simme valley (1439–1440), Interlaken, with Grindelwald, Lauterbrunnen and Berna (1526 on the suppression of the Austin Canons of Interlaken), Saanen or Gessenay (1555), Kôniz (1729), and the Bernese Jura with Bienne (1815, from the bishopric of Basel). But certain regions previously won were lost in 1798—Aargau (1415), Aigle and Grandson (1475), Vaud (1536), and the Pays d’En-Haut or Château d’Oex (1555). From 1798 to 1802 the Oberland formed a separate canton (capital, Thun) of the Helvetic Republic.

BERN (Fr. Berne), the capital of the Swiss canton of the same name, and, by a Federal law of 1838, the political capital of the Swiss confederation. It is most picturesquely situated on a high bluff or peninsula, round the base of which flows the river Aar, thus completely cutting off the old town, save to the west. Five lofty bridges have been thrown over the Aar, the two most modern being the Kirchfeld and Kornhaus bridges which have greatly contributed to create new residential quarters near the old town. Within the town the arcades (or Lauben) on either side of the main street, and the numerous elaborately ornamented fountains attract the eye, as well as the two remaining towers that formerly stood on the old walls but are now in the centre of the town (famous for its singular 16th-century clock, with its mechanical contrivances, set in motion when the hour strikes) and the Käֆlekturm. The principal medieval building in Bern is the (now Protestant) Münster, begun in 1421 though not completed till 1573. The tower, rising conspicuously above the town, has recently been well restored, but the church was never a cathedral church (as is often stated), for there has never yet been a bishop of Bern. The federal Houses of Parliament (Bundeshaus) were much enlarged in 1888–1894, the older portions dating from 1832–1857, and also contain the offices of the federal executive and administration. The town hall dates from 1426, while some of the houses belonging to the old guilds contain much of interest. The town library (with which that of the university was incorporated in 1905) contains a vast store of MSS. and rare printed books, but should be carefully distinguished from the national Swiss library, which, with the building for the federal archives, is built in the new Kirchfeld quarter. There are a number of museums; the historical (archaeological and medieval), the natural history (in which the skin of Barry, the famous St Bernard dog, is preserved), the art (mainly modern Swiss pictures), and the Alpine (which are collections of all kinds relating to the Swiss Alps). Bern possesses a university (founded in 1834) and two admirably organized hospitals. The old fortifications (Schansen) have been converted into promenades, which command wonderful views of the snowy Alps of the Bernese Oberland. Just across the Nydeck bridge is the famous bear pit in which live bears are kept, as they are supposed to have given the name to the town; certainly a bear is shown on the earliest known town seal (1224), while live bears have been maintained at the charges of the town since 1513. There is comparatively little industrial activity in the town, the importance of which is mainly political, though of late years it has been selected as the seat of various international associations (postal, telegraph, railway, copyright, &c.). The climate is severe, as the town is much exposed to cold winds blowing from the snowy Alps. In point of population it is exceeded in Switzerland by Zürich, Basel and Geneva, though the number of inhabitants has risen from 27,538 in 1859 and 43,197 in 1880 to 64,227 in 1900. In 1900, 59,085 inhabitants were German-speaking; while 57,144 were Protestants, 6687 Romanists (including Old Catholics) and 655 Jews. The height of the town above sea-level is 178 ft.

The ancient castle of Nydeck, at the eastern end of the peninsula, guarded the passage over the Aar, and it was probably its existence that induced Berchtold V., duke of Zähringen, to found Bern in 1191 as a military post on the frontier between the Alamans (German-speaking) and the Burgundians (French-speaking). Thrice the walls which protected the town were moved westwards, about 1250, in 1346 and in 1622, though even at the last-named date the town only stretched a little way to the west of (or beyond) the present railway station. After the extinction of the Zähringe, Bern became in 1291 a free imperial city, but it had to fight hard for its independence, which was finally secured by the victories of Dornbühl (1298) over Fribourg and the Habsburgs, and of Laupen (1339) over the neighbouring Burgundian nobles. In the second battle Bern received help from the three forest cantons with which it had become allied in 1333, while in 1353 it entered the Swiss confederation as its eighth member. It soon took the lead in the confederation, though always aiming at enlarging its own borders, even at great risks (see the article on the canton). In 1528 Bern accepted the religious reformation, and henceforth became one of its chief champions in Switzerland. In the 17th century the number of families by which high offices of state could be held was diminished, so that in 1605 there were 152 thus qualified, but in 1691 only 104, while towards the end of the 18th century there were only 69 such families. Meanwhile the rule of the town was extending over more and more territory, so that finally it governed 52 bailiwicks (acquired between 1324 and 1729), the Bernese patricians being thus extremely powerful and forming an oligarchy that administered affairs like a benevolent and well-or-organized despotic government. In 1803 a French army under General Henri, in Bern itself, tried to break down this monoply, but in each case paid the penalty of failure on the scaffold. The whole system was swept away by the French in 1798, and though partially revived in 1815, came to an end in 1831, since which time Bern has been in the van of political progress. From 1815 to 1848 it shared with Zürich and Lucerne the supreme rule (which shifted from one to the other every two years) in the Swiss confederation, while in 1848 a federal law made Bern the sole political capital, where the federal government is permanently fixed and where the ministers of foreign powers reside.

BERNARD, SAINT (1090-1153), abbot of Clairvaux one of the most illustrious preachers and monks of the middle ages, was born at Fontaines, near Dijon, in France. His father, a knight named Tocelin, perished on crusade; and his mother Aleth, a daughter of the noble house of Mon-Barb, and a woman distinguished for her piety, died while Bernard was yet a boy. The lad was constitutionally unfitted for the career of arms, and his own disposition, as well as his mother's early influence, directed him to the church. His desire to enter a monastery was opposed by his relations, who sent him to study at Châlons, where he was not likely to qualify for his ideal monastic profession. Bernard's resolution to become a monk was not, however, shaken, and when he at last definitely decided to join the community which Robert of Molesmes had founded at Citeaux in 1106, he carried with him his brothers and many of his relations and friends. The little community of refined Benedictines, which was to produce so profound an influence on Western monachism (see CISTERCIANS AND MONASTICISM), had seemed on the point of extinction for lack of novices, gained a sudden new life through this accession of some thirty young men of the best families of the neighbouring cities, most jealous of the imperial claims, surrendered to his eloquence, submitted to Lothair and to Innocent, and tried to force Bernard against his will into the vacant see of St Ambrose. In 1137, the year of Lothair's last journey to Rome, Bernard was back in Italy again; at Monte Cassino, setting the affairs of the monastery in order, at Salerno, trying in vain to induce Roger of Sicily to declare against Anacletus, in Rome itself, agitating with success against the antipope. Anacletus died on the 25th of January 1138; on the 13th of March the cardinal Gregory was elected his successor, assuming the name of Victor. Bernard's crowning triumph in the long contest was the abdication of the new antipope, the result of his personal influence. The schism of the church was healed, and the abbot of Clairvaux was free to return to the peace of his monastery.

Clairvaux itself had meanwhile (1135-1136) been transformed outwardly—in spite of the reluctance of Bernard, who preferred the rough simplicity of the original buildings—into a more suitable seat for an influence that overshadowed that of Rome itself. How great this influence was is shown by the outcome of Bernard's contest with Abélard (q.v.). In intellectual and theological points of view there was no match for the great schoolmaster; yet at Sens in 1141 Abélard feared to face him, and when he appealed to Rome Bernard's word was enough to secure his condemnation.

One result of Bernard's fame was the marvellous growth of the Cistercian order. Between 1130 and 1145 no less than ninety-three monasteries in connexion with Clairvaux were either founded or affiliated from other rules, three being established in England and one in Ireland. In 1145 a Cistercian monk, once a member of the community of Clairvaux—another Bernard, abbot of Aigue-Silvâtre near Rome, was elected pope as Eugenius III. This was a triumph for the order; to the world it was a triumph for Bernard, who complained that all who had suits to press at Rome applied to him, as though he himself had mounted the chair of St Peter (Ep. 230).

Having healed the schism within the church, Bernard was next called upon to attack the enemy without. Languedoc especially had become a hotbed of heresy, and at this time the preaching of Henry of Lausanne (q.v.) was drawing thousands from the orthodox faith. In June 1145, at the invitation of Cardinal Alberic of Ostia, Bernard travelled in the south, and by his preaching did something to stem the flood of heresy for a while. Far more important, however, was his activity in the following year, when, in obedience to the pope's command, he preached a crusade. The effect of his eloquence was extraordinary. At the great meeting at Vezelay, on the 21st of March, as the result of his sermon, King Louis VII of France and his queen, Eleanor of Guienne, took the cross, together with a host of all classes, so numerous that the stock of crosses was soon exhausted; Bernard next travelled through northern France, Flanders and the Rhine provinces, everywhere rousing the wildest enthusiasm: and at Spire on Christmas day he succeeded in persuading Conrad, king of the Romans, to join the crusade. The lamentable outcome of the movement (see CRUSADES) was a hard blow to Bernard, who found it difficult to understand this manifestation of the hidden counsels of God, but ascribed it to the sins of the crusaders (Ep. 488; de Consid. ii. 1). The news of the disasters to the crusading host first reached Bernard at Clairvaux, where Pope Eugenius, driven from Rome by the revolution associated with the name of Arnold of Brescia, was his guest. Bernard had in March and April 1148 accompanied the pope to the council of Reims, where he led the attack on
certain propositions of the scholastic theologian Gilbert de la Porcié (q.v.). From whatever cause—whether the growing jealousy of the cardinals, or the loss of prestige owing to the rumoured failure of the crusade, the success of which he had so confidently predicted—Bernard's influence, hitherto so ruinous to those suspected of heterodoxy, on this occasion failed of its full effect. On the news of the full extent of the disaster that had overtaken the crusaders, an effort was made to retrieve it by organizing another expedition. At the invitation of Suger, abbot of St Denis, now the virtual ruler of France, Bernard attempted the presidency of the expedition for this purpose, where he himself was elected to conduct the new crusade, the choice being confirmed by the pope. He was saved from this task, for which he was physically and constitutionally unfit, by the intervention of the Cistercian abbots, who forbade him to undertake it.

Bernard was now ageing, broken by his austerities and by ceaseless work, and saddened by the loss of several of his early friends. But his intellectual energy remained undimmed. He continued to take an active interest in ecclesiastical affairs, and an essay, De indicatione, shows a sign of failing power. He died on the 26th of February, 1153.

The greatness of St Bernard lay not in the qualities of his intellect, but of his character. Intellectually he was the child of his age, inferior to those subtle minds whom the world, fired by his contagious zeal, conspired to crush. Morally he was their superior; and in this moral superiority lay the secret of his power. The age recognized in him the embodiment of its ideal: that of medieval monasticism at its highest development. The world had no meaning for him save as a place of banishment and trial, in which men are but "strangers and pilgrims" (Serm. i. Epiph. n. 1; Serm. vii. Lent. n. 1); the way of grace, not to the lost inheritance, had been marked out once for all, and the function of theology was but to maintain the landmarks inherited from the past. With the subtleties of the schools he had no sympathy, and the dialectics of the schoolmen quavered into silence before his terrible invective. Yet, within the limits of his mental horizon, Bernard's vision was clear enough. His very life proves with what merciless logic he followed out the principles of the Christian faith as he conceived it; and it is impossible to say that he conceived it amiss. For all his overmastering zeal he was last nature, neither a bigot nor a persecutor. Even when he was preaching the crusade he interfered at Mains to stop the persecution of the Jews, stirred up by the monk Radulf. As for heretics, "the little foxes that spoil the vines," these "should be taken, not by force of arms, but by force of argument," though, if any heretic refused to be thus taken, he considered "that he should be driven away, or even a restraint put upon his liberty, rather than that he should be allowed to spoil the vines" (Serm. lxiv). He was evidently troubled by the mob violence which made the heretics "martyrs to their unbelief." He approved the zeal of the people, but could not advise the imitation of their action, "because faith is to be produced by persuasion, not imposed by force"; adding, however, in the true spirit of his age and of his church, "it would without doubt be better that they should be coerced by the sword than that they should be allowed to draw away many other persons into their error."

Finally, oblivious of the precedent of the Pharisees, he ascribes the steadfastness of these "dogs" in facing death to the power of the devil (Serm. lxvi. on Canticles ii. 15).

This is Bernard at his worst. At his best—and, fortunately, this is what is mainly characteristic of the man and his writings—he displays a nobility of nature, a wise charity and tenderness in his dealings with others, and a genuine humility, with no touch of servility, that make him one of the most complete exponents of the Christian life. His broadly Christian character is, indeed, witnessed to by the enduring quality of his influence. The author of the Imitatio drew inspiration from his writings; the reformers saw in him a medieval champion of their favourite doctrine of the supremacy of the divine grace; his works, down to the present day, have been reprinted in countless editions. This is perhaps due to the fact that the chief fountain of his own inspiration was the Bible. He was saturated in its language and in its spirit; and though he read it, as might be expected, uncritically, and interpreted its plain meanings allegorically—'as the fashion of the day was—it saved him from the grosser aberrations of medieval Catholicism. He accepted the teaching of the church as to the reverence due to our Lady and the saints, and on feast-days and festivals these receive their due meed in his sermons; but in his letters and sermons their names are at other times seldom invoked. They were overshadowed completely in his mind by his idea of the grace of God and the moral splendour of Christ; "from Him do the Saints derive the odor of sanctity; from Him also do they shine as lights" (Ep. 46).

The cause of Bernard's extraordinary popular success as a preacher can only imperfectly be judged by the sermons that survive. These were all delivered in Latin, evidently to congregations more or less on his own intellectual level. Like his letters, they are full of quotations from and reference to the Bible, and they have all the qualities likely to appeal to men of culture at all times. "Bernard," wrote Erasmus in his Art of Preaching, "is an eloquent preacher, much more by nature than by art; he is devoured and charmed, and knows how to remove and move the affections." The same is true of the letters and to an even more striking degree. They are written on a large variety of subjects, great and small, to people of the most diverse stations and types; and they help us to understand the adaptable nature of the man, which enabled him to appeal as successfully to the unlearned as to the learned.

Bernard's works fall into three categories:—(1) Letters, of which over five hundred have been preserved, of great interest and value for the history of the period. (2) Treatises: (a) dogmatic and polemical, De gratia et libero arbitrio, written about 1127, and following closely the lines laid down by St Augustine; De baptismo alisique questionibus ad mag. II uogonem de S. Victor. Contru quaedam capitaia errorum Abaelardi ad Innocentium II. (in justification of the action of the synod of Sens); (b) ascetic and mystical, De grandibus humilitatis et superbiae, his first work, written perhaps about 1121; De diligendo Deo (about 1126): De conversione ad clerics, an address to candidates for the priesthood; De Considratione, Bernard's last work, written about 1148 at the pope's request for the edification and guidance of Eugenius III.; (c) about monasticism, Apologia ad Guilelmum, written about 1127 to William, abbot of St Thierry; De laude novae militiae ad milites templi (c. 1132-1136); De preceptio et dispensatione, an answer to various questions on monastic conduct and discipline addressed to him by the monks of St Peter at Chartres (some time before 1143); (d) on ecclesiastical government, De moribus et officio episcoporum, written about 1126 for Henry, bishop of Sens; the De Considratione mentioned above; (e) a biography, De vita et rebus gestis S. Malachii. Hibernia episcopii, written at the request of the Irish abbot Congan and with the aid of materials supplied by him; it is of importance for the ecclesiastical history of Ireland in the 12th century; (f) sermons—divided into Sermones de tempore; de sanctis; de diversis; and eighty-six sermons, in Cantica Canticorum, an allegorical and mystical exposition of the Song of Solomon; (g) hymns. Many hymns ascribed to Bernard survive, e.g. Jesu dulcis memoria, Jesus rex admirabilis, Jesus deus angelicam, Salve caput cruentatum. Of these the three first are included in the Roman breviary. Many have been translated and are used in Protestant churches.

St Bernard's works were first published in anything like a complete edition at Paris in 1568, under the title Seraphica melliflina devotique doctoris S. Bernardi scripta, edited by André Bocard; the first really critical and complete edition is that of Dom J. Mabillon Sauci Bernardi opp. Sec. (Paris, 1672), improved and enlarged in 1690, and again, by Massuet and Texier, in 1719. Reprinted by J. P. Migne, Patrolog. lat. (Paris, 1850). There is an English translation of Mabillon's edition, including, however, only the letters and the sermons on the Song of Songs, with the biographical and other prefaces, by Samuel J. Eales (4 vols., London, 1889-1895). See further Leopold Janauschek,
BERNARD, CHARLES DE (1835-1878), French physician, was born on the 12th of July 1835 in the village of Saint-Julien near Villefranche. He received his early education in the Jesuit school of that town, and then proceeded to the college at Lyons, which, however, he soon left to become assistant in a druggist's shop. His leisure hours were devoted to the composition of a vaudeville comedy, La Rose du Rhône, and the success it achieved moved him to attempt a prose drama in five acts, Arthur de Bretagne. At the age of twenty-one he went to Paris, armed with this play and an introduction to Saint-Marc Girardin, but the critic dissuaded him from adopting literature as a profession, and urged him rather to take up the study of medicine. This advice he followed, and he entered the Hôtel Dieu. In this way he was brought into contact with the great physiologist, F. Magendie, who was physician to the hospital, and whose official préparateur at the Collège de France he became in 1841. Six years afterwards he was appointed his deputy-professor at the collège, and in 1855 he succeeded him as full professor. Some time previously he had been chosen the first occupant of the newly-instituted chair of physiology at the Sorbonne. There no laboratory was provided for his use, but Louis Napoleon, after an interview with him in 1864, supplied him with the building now known as the laboratory of physiology. From this time he was the occupant of the natural history museum in the Jardin des Plantes, and a member of the Institute. He died in Paris on the 10th of February 1878 and was accorded a public funeral—an honour which had never before been bestowed by France on a man of science.

Claude Bernard's first important work was on the functions of the pancreas gland, the juice of which he proved to be of great significance in the process of digestion; this achievement won him the Césaré prize for experimental physiology from the Academy of Sciences. A second investigation—perhaps his most famous—was on the glycojenic function of the liver; in the course of this he was led to the conclusion, which throws light on the causation of diabetes, that the liver, in addition to secreting bile, is the seat of an "internal secretion," by which it prepares sugar at the expense of the elements of the blood passing through it. A third research resulted in the discovery of the vaso-motor system. While engaged, about 1851, in examining the effects produced in the temperature of various parts of the body by section of the nerve or nerves belonging to them, he noticed that division of the cervical sympathetic gave rise to more active local contraction and more forcible pulsation of the arteries in certain parts of the head, and a few months afterwards he observed that electrical excitation of the upper portion of the divided nerve had the contrary effect. In this way he established the existence of vaso-motor nerves—both vaso-dilator and vaso-constrictor. The study of the physiological action of poisons was also a favourite one with him, his attention being devoted in particular to curare and carbon monoxide gas. The earliest announcements of his results, the most striking of which were obtained in the ten years from about 1850 to 1860, were generally made in recognized scientific publications; but the full exposition of his views, and even the statement of some of the original facts, can only be found in his published lectures. The various series of these Leçons fill seventeen octavo volumes. He also published Introduction à la médecine expérimentale (1865), and Physiologie générale (1872).

An English Life of Bernard, by Sir Michael Foster, was published in 1881.
BERNAY, M.—BERNAY

December 1688. In 1692 he began his *Lettres historiques*, containing an account of the most important transactions in Europe; he carried on this work till the end of 1698, after which it was continued by others. When Le Clerc discontinued his *Bibliothèque universelle* in 1691, Bernard wrote the greater part of the twentieth volume and the five following volumes. In 1698 he collaborated and published *dessein et negociations de la paix de Ryswick*, in four volumes 12mo. In 1699 he began a continuation of Bayle's *Nouvelles de la république des lettres*, which continued till December 1710. In 1705 he was unanimously elected one of the ministers of the Walloon church at Leiden; and about the same time he succeeded M. de Valder in the chair of philosophy and mathematics at Leiden. In 1716 he published a supplement to Morellet's dictionary, in two volumes folio. The same year he resumed his *Nouvelles de la république des lettres*, and continued it till his death, on the 27th of April 1718. Besides the works above mentioned, he was the author of two practical treatises, one on late repentance (1712), the other on the excellence of religion (1714).

BERNARD, MOUNTAGUE (1820-1882), English international lawyer, the third son of Charles Bernard of Jamaica, the descendant of a Huguenot family, was born at Tihberton Court, Gloucestershire, on the 28th of January 1820. He was educated at Sherborne school, and Trinity College, Oxford. Graduating B.A. in 1842, he took his B.C.L., was elected Vinerian scholar and fellow, and having read in chambers with Roundell Palmer (afterwards Lord Selborne), was called to the bar at Lincoln's Inn in 1846. He was specially interested in legal history and in church questions, and was one of the founders of the *Guardian*. In 1852 he was elected to the new professorship of international law and diplomacy at Oxford, attached to All Souls' College, of which he afterwards was made a fellow. But besides his duties at Oxford he undertook a good deal of non-collegiate work; he was a member of several royal commissions; in 1871 he went as one of the high missionaries to the United States, and signed the treaty of Washington, and in 1872 he assisted Sir Roundell Palmer before the tribunal of arbitration at Geneva. In 1876 he resigned his professorship at Oxford, but as member of the university of Oxford commission of 1870 he was mainly responsible for bringing about the compromise ultimately adopted between the university and the colleges. Bernard's reputation as an international lawyer was widespread, and he was an original member of the *Institut de Droit International* (1873). His published works include *An Historical Account of the Neutrality of Great Britain during the American Civil War* (London, 1870), and many lectures on international law and diplomacy.

BERNARD, SIMON (1779-1839), French general of engineers, was born at Dôle, educated at the *École Polytechnique*, and entered the army in the corps of engineers. He rose rapidly, and served (1805-1812) as aide-de-camp to Napoleon. He was wounded in the retreat after Leipzig, and distinguished himself the same year (1813) in the gallant defence of Torgau against the allies. After the emperor's fall he emigrated to the United States, where, being made a brigadier-general of engineers, he executed a number of extensive military works for the government, notably at Fortress Monroe, Va., and around New York, and did a large amount of the civil engineering connected with the Chesapeake and Ohio Canal and the Delaware Breakwater. He returned to France after the revolution of 1830, was made a lieutenant-general by Louis Philippe, and in 1836 served as minister of war.

BERNARD, SIR THOMAS, BART. (1750-1818), English social reformer, was born at Lincoln on the 27th of April 1750, the younger son of Sir Francis Bernard, 1st bart. (1711-1770), who as governor of Massachusetts Bay (1760-1770) played a responsible part in directing the British policy which led to the revolt of the American colonies. On the death of his elder brother in 1810, Bernard succeeded to the baronetcy conferred on his father in 1760. His early education was obtained in America, partly at Harvard, in which college his father took a great interest. He then acted as confidential secretary to his father during the troubles which led (1769) to the governor's recall, and accompanied Sir Francis to England, where he was called to the bar, and practised as a conveyancer. He married a rich wife, and acquired a considerable fortune, and then devoted most of his time to social work for the benefit of the poor. He was treasurer of the Foundling Hospital, in the conversions of which he took an important part. He helped to establish in 1766 the "Society for Bettering the Condition and Increasing the Comforts of the Poor," in 1800 a school for indigent blind, and in 1801 a fever institution. He was active in promoting vaccination, improving the conditions of child labour, advocating rural allotments, and agitating against the salt duties. He took great interest in education, and with Count Rumford he was an originator of the Royal Institution in London. He died without issue on the 1st of July 1818.

BERNARDIN OF SIENA, ST (1380-1444), Franciscan friar and preacher, was born of a noble family in 1380. His parents died in his childhood, and on the completion of his education he spent some years in the service of the sick in the hospitals, and thus caught the plague, of which he nearly died. In 1407 he entered the Franciscan order in the strict branch called Observant, of which he became one of the chief promoters (see FranciscaNs). Shortly after his profession the work of preaching was laid upon him, and for more than thirty years he preached with wonderful effect all over Italy, and played a great part in the religious revival of the beginning of the 15th century. In 1432 he became one of the founders of the branch of the Franciscans. He refused three bishoprics. He died in 1444 at Aquila in the Abruzzi, and was canonized in 1450. The first edition of his works, for the most part elaborate sermons, was printed at Lyons in 1501; later ones in 1636, 1650 and 1745. His Life will be found in the *Volland dictionary*. The letters which first appeared in print on the 20th of May: a good modern biography has been written by Paul Thureau-Dangin (1896), and translated into English by Gertrude von Hügel (1906).

BERNAUER, AGNES (d. 1435), daughter of an Augsburg baker, was secretly married about 1432 to Albert (1401-1460), son of Ernest, duke of Bavaria-Munich. Ignorant of the fact that this union was a lawful one, Ernest urged his son to marry, and reproached him with his connexion with Agnes. Albert then declared she was his lawful wife; and subsequently, during his absence, she was seized by order of Duke Ernest and condemned to death for witchcraft. On the 12th of October 1435 she was drowned in the Danube near Straubing, in which town her remains were afterwards buried by Albert. This story lived long in the memory of the people, and its chief interest lies in its literary associations. It has afforded material for several dramas, and Adolf Böttger, Friedrich Hebel and Otto Ludwig have written operas on the same subject. 

BERNAY, a town of north-western France, capital of an arrondissement in the department of Eure, on the left bank of the Chartonnet, 31 m. W.N.W. of Evreux, on the Western railway between that town and Lisieux. Pop. (1906) 5973. It is beautifully situated in the midst of green wooded hills, and still justifies Madame de Stael's description of it as "a basket of flowers." Of great antiquity, it possesses numerous quaint wooden houses and ancient ecclesiastical buildings of considerable interest. The abbey church is now used as a market, and the abbey of St. Judit.The history of Brittany early in the 11th century, and underwent a restoration in the 17th century, serves for municipal and legal purposes. The church of St. Croix, which has a remarkable marble figure of the infant Jesus, dates from the 14th and 15th centuries, that of Notre-Dame de la Couture, which preserves some good stained glass, from the 14th, 15th and 16th centuries. Bernay has a sub-prefecture, a communal college, tribunals of commerce and of first instance, and a board of trade-arbitrators. Among the industrial establishments of the place are manufactories of cotton and woolen goods, bleacheries and dye-works. Large numbers of Norman horses are sold in Lent, at the fair known as the *Foire fleurie*, and there is also a trade in grain. Bernay grew up round the Benedictine abbey mentioned above, and early in the 13th century was the seat of a viscount. The town, formerly fortified.
Bernays is of great antiquity. The Bergstadt was fortified by Otto III. in the 10th century, and the new town was founded in the 13th. For a long period the different parts were under separate municipalities, the new town uniting with the old in 1560, and the Bergstadt with both in 1824. Prince Frederick removed the ducal residence to Ballenstedt in 1765.

Berners, John Bouchier, 2nd Baron (1460-1533). English translator, was born probably at Tharfield, Hertfordshire, about 1460. His father was killed at Barnet in 1471, and he inherited his title in 1474 from his grandfather, John Bouchier, who was a descendant of Edward III. It is supposed that he was educated at Oxford, perhaps at Balliol. His political life began early, for in 1483 he was implicated in a premature attempt to place Henry, duke of Richmond (afterwards Henry VII.), on the throne, and fled in consequence to Brittany. In 1497 he helped to put down an insurrection in Cornwall and Devonshire, raised by Michael Joseph, a blacksmith, and from this time was in high favour at court. He accompanied Henry VIII. to Calais in 1513, and was a captain of pioneers at the siege of Therouanne. In the next year he was again sent to France as chamberlain to the king’s sister Mary on her marriage with Louis XII., but he soon returned to England. He had been given the reversion of the office of lord chancellor, and in 1516 he received the actual appointment. In 1518 he was sent to Madrid to negotiate an alliance with Charles of Spain. He sent letters to Henry chronicling the bull-fights and other doings of the Spanish court, and to Wolsey complaining of the annoyance which he had to undergo from them.

In the next year he returned to England, and with his wife Catherine Howard, daughter of the duke of Norfolk, was present in 1520 at the Field of the Cloth of Gold. But his affairs were greatly embarrassed. He was harassed by lawsuits about his Hertfordshire property and owed the king sums which he was unable to repay. Perhaps in the hope of repairing his fortune, he accepted the office of deputy of Calais, where he spent the rest of his life in comparative leisure, though still harassed by his debts, and died on the 16th of March 1533.

His brother, Michael Berners (1384-1479), was born in Hamborg on the 27th of November 1384. He studied first law and then literature at Bonn and Heidelberg, and obtained a considerable reputation by his lectures on Shakespeare at Leipzig and an explanatory text to Beethoven’s music to Egmont. Having refused an invitation to take part in the editorship of the Preussische Jahrbücher, in the same year (1866) he published his celebrated Zur Kritik und Geschichte des Goethe- schen-Textes. He confirmed his reputation by his lectures at the university of Leipzig, and in 1873 accepted the post of extraordinary professor of German literature at Munich specially created for him by Louis II. of Bavaria. In 1874 he became an ordinary professor, a position which he only resigned in 1889 when he settled at Carlsruhe. He died at Carlsruhe on the 29th of February 1897. At an early age he had embraced Christianity, whereas his brother Jakob remained a Jew. Among his other publications were: Briefe Goethes an F. A. Wolf (1868); Zur Erstellungsgeschichte des Schillergeschens Shakespeare (1872); an introduction to Hirzel’s collection entitled Der junge Goethe (1873); and he edited a revised edition of Voss’s translation of the Odyssey. From his literary remains were published Schriften zur Kritik und Literaturgeschichte (1895-1899).

Bernburg, a town in the duchy of Anhalt, Germany, on the Saale, 20 m. N. by W. from Halle by rail, formerly the capital of the now incorporated duchy of Anhalt-Bernburg. Pop. (1900) 34,427; (1905) 34,920. It consists of four parts, the Altstadt or old town, the Bergstadt or hill town, the Neustadt or new town, and the suburb of Waldau—the Bergstadt on the right and the other three on the left of the river Saale, which is crossed by a massive stone bridge. It is a well-built city, the principal public buildings being the government house, the church of St Mary, the gymnasium and the house of correction. The castle, formerly the ducal residence, is in the Bergstadt, defended by moats, and surrounded by beautiful gardens. Bernburg is the seat of an extensive silk industry, manufacturing machinery and boilers, sugar, pottery and zinc smelting. Market-gardening is also extensively carried on, and there is a large river traffic in grain and agricultural produce.
BERNERS, BARNES or BERNES, JULIANA (b. 1588?). English writer on hunting and fishing, is said to have been prioress of Sopwell nunnery near St Albans, and daughter of Sir James Berners, who was beheaded in 1538. She was probably brought up at court, and when she adopted the religious life, she still retained her love of hunting, fishing, and her passion for field sports. The only documentary evidence regarding her, however, is the statement at the end of her treatise on fishing in the Book of St Albans, "Explicit Dam Julians Bernes," that the name is changed by Wynkyn de Worde to "dame Julians Bernes." There is no such person to be found in the pedigree of the Berners family, and there is a gap in the records of the priory of Sopwell between 1430 and 1480. Juliana Berners is the supposed author of the work generally known as the Book of St Albans. The first and rarest edition was printed in 1486 by an unknown schoolmaster at St Albans. It has no title-page. Wynkyn de Worde's edition (fol. 1496), also without a title-page, begins: "This present boke shewyth the manere of hawkynge and hunting of divers beasts. The shewyth also a good mateure belongynge to horses: wyth other comendable treatyses. And ferdermore of the blysasynge of armes: as hereafter it may apeere." This edition was adorned by three woodcuts, and included a "Treatise of fysshyngh wyth an Angle," not contained in the St Albans edition. J. Haslewood, who published a facsimile of that of Wynkyn de Worde (London, 1811, folio), with a biographical and bibliographical notice, examined with the greatest care the author's claims to figure as the earliest woman author in the English language. In his treatise on hawkynge and the section on hunting it is expressly stated at the end of the "Blysasynge of Armys" that the section was "translatyd and compylyt," and it is likely that the other treatises are translations, probably from the French. An older form of the treatise on fishing was edited in 1883 by Mr T. Satchell from a MS. in possession of Mr A. Denison. This treatise probably dates from about 1450, and formed the foundation of that section in the book of 1496. Only three perfect copies of the first edition are known to exist. A facsimile, entitled The Book of St Albans, with an introduction by William Blades, appeared in 1961. During the 16th century the boke was very popular, and was many times reprinted. It was edited by Gervase Markham in 1595 as The Gentleman's Academie.

BERNHARDT, SARA (1844-1923). French actress, was born in Paris on the 22nd of October 1845, of mixed French and Dutch parentage, and of Jewish descent. She was, however, baptised at the age of twelve and brought up in a convent. At thirteen she entered the Conservatoire, where she gained the second prize for tragedy in 1861 and for comedy in 1862. Her début was made at the Comédie Française on the 11th of August 1862, in a minor part in Racine's L'Iphigénie en Tauride. Without any important part, she did so much here, however, that she was presented in burlesque at the Porte St-Martin and Gymnase. In 1867 she became a member of the company at the Odéon, where she made her first definite successes as Cordelia in a French translation of King Lear, as the queen in Victor Hugo's Le Ruy Blas, and, above all, as Zanetto in François Coppée's Le Passant (1869). When peace was restored after the Franco-German War she left the Odéon for the Comédie Française, thereby incurring a considerable monetary forfeit. From that time she steadily increased her reputation, two of the most definite steps in her progress being her performances of Phèdre in Racine's play (1874) and of Donna Sol in Victor Hugo's Hernani (1877). In 1879 she had a famous season at the Gaîté in London. By this time her position as the greatest actress of her day was securely established. Her amazing power of emotional acting, the extraordinary realism and pathos of her death-scenes, the magnetism of her personality, and the beauty of her "voix d'or," made the public tolerant of her occasional caprices. She had developed some skill as a sculptor, and exhibited at the Salon at various times between 1876 (honourable mention) and 1881. She also exhibited a painting there in 1880. In 1878 she published a prose sketch, Dans les nuages; les impressions d'une chaise. Her comedy L'Aveu was produced in 1888 at the Odéon without much success. Her relations with the other sociétés of the Comédie Française having become somewhat strained, a crisis arrived in 1880, when, enraged by an unfavourable criticism of her acting, she threw up her position on the day following the first performance of Emile Augier's L'Aventurière. This obliged her to pay a forfeit of £4000 for breach of contract.
BERNHARDY—BERNICIAN SERIES

Immediately after the rupture she gave a series of performances in London, relying chiefly upon Scribe and Legouvé's *Adrienne Lecouvreur* and Melhac and Halsey's *Frou Frou*. These were followed by tours in Denmark, Norway and Russia, during 1824 and 1825, with *La Dame aux camélias* as the principal attraction.

In 1822 she married Jacques Damala, a Greek, in London, but separated from him at the end of the following year. After a fresh triumph in Paris with Sardou's *Fédora* at the Vaudeville she became proprietress of the Porte St-Martin. Jean Richépin's *Nana Sakib* (1883), Sardou's *Théodora* (1884) and *La Tosca* (1887), Jules Barbier's *Jeanne d'Arc* (1890) and Sardou and Moreau's *Chéopâtre* (1890) were among her most conspicuous successes here, where she remained till she became proprietress of the Renaissance theatre in 1893.

In the same year she made several extended tours, including visits to America in 1886–1887 and 1888–1889. Between 1891 and 1893 she again visited America (North and South), Australia, and the chief European capitals. In November 1893 she opened the Renaissance with *Les Reis* by Jules Lemaitre, which was followed by *Sylvestre* and Morand's *Iseyl* (1894), Sardou's *Gismonda* (1894) and Edmond Rostand's *La Princesse lointaine* (1895). In 1895 she also appeared with conspicuous success as Magda in a French translation of Sudermann's *Heimat*. For the next few years she visited London almost annually, and appeared in *La Tosca* in that city, with a success that led to the adoption of Alfred de Musset's *Lorenzaccio*. In Easter week of 1897 she played in a religious drama, *La Samaritaine*, by Rostand. In December 1896 an elaborate fête was organized in Paris in her honour; and the value of this public recognition of her position at the head of her profession was enhanced by cordial greetings from all parts of the world. By this time she had played one hundred and twelve parts, thirty-eight of which she had created. Early in 1899 she removed from the Renaissance to the Théâtre des Nations, a larger house, which she opened with a revival of *La Tosca*. In the same year she played a French production of *Hamlet*, in which she played the title part. She repeated the impersonation in London not long afterwards, and she also appeared (1901) as the fate-ridden son of *Napoleon I*, in Rostand's *L'Atiglon*, which had been produced in Paris the year before.

Of the successful productions of her later years perhaps none was more remarkable than her impersonation of *La Tisbé* in Victor Hugo's romantic drama *Angelo* (1909).

BERNARDY, GOTTFRIED (1800–1875), German philologist and literary historian, was born on the 20th of March 1800, at Landsberg on the Wartia, in Brandenburg. He was the son of Jewish parents in reduced circumstances. Two well-to-do uncles provided the means for his education, and in 1811 he entered the Joachimsthal gymnasium at Berlin. In 1817 he went to Berlin University to study philology, where he had the advantage of hearing F. A. Wolf (then advanced in years), August Böckh and P. Buttmann. In 1822 he took the degree of doctor of philosophy at Berlin, and in 1825 became extraordinary professor. In 1829 he succeeded C. Reisig as ordinary professor and director of the philosophical seminary at Halle, and in 1834 was appointed chief librarian of the university. He died suddenly on the 14th of May 1875. The most important of Bernhardy's works were his histories (or sketches) of Greek and Roman literature; *Grundriss der römischen Literatur* (5th ed., 1872); *Grundriss der griechischen Literatur* (pt. i., Introduction and General View, 1836; pt. ii., Greek Poetry, 1845; pt. iii., Greek Prose Literature, was never published). A fifth edition of pts. i. and ii., by R. Volkmann, began in 1892. Other works by Bernhardy are: *Erdtunstatiographie* (1821); *Wissenschaftlicher Synoptik der griechischen Sprache* (1831, 1832, 1838); *Grundlinien zur Encyclopädie der Philologie* (1832); the monumental edition of the Lexicon of Suidas (1834–1835); and an edition of F. A. Wolf's *Kleine Schriften* (1869).

See Volkmann, G. Bernhardy (1887).

BERNI, FRANCESCO (1497–1536), Italian poet, was born about 1497 at Lamporecchio, in Bibbiena, a district lying along the Upper Arno. His family was of good descent, but excessively poor. At an early age he was sent to Florence, where he remained till his 19th year. He then set out for Rome, trusting to obtain some assistance from his uncle, the Cardinal Bibbiena. The cardinal, however, did nothing for him, and he was obliged to accept a situation as clerk or secretary to Ghiberti, datary to Clement VII. The duties of his office, for which Berni was in every way unfit, were exceedingly irksome to the poet, who, however, made himself celebrated at Rome as the most witty and inventive of a certain club of literary men, who devoted themselves to light and sparkling effusions. So strong was the admiration for Berni's verses, that mocking or burlesque poems have since been called *poëte bernuccio*. About the year 1530 he returned to Florence from Rome and was appointed sacrist of the cathedral of Florence. In that city he died in 1536, according to tradition poisoned by Duke Alessandro de' Medici, for having refused to poison the duke's cousin, Ippolito de' Medici; but considerable obscurity rests over this story. Berni stands at the head of Italian comic or burlesque poets. For lightness, sparkling wit, variety of form and fluent diction, his verses are unsurpassed. Perhaps, however, he owes his greatest fame to the recasting (*Raficamento*) of Botardo's *Orlando Innamorato*. The enormous success of Ariosto's *Orlando Furioso* had directed fresh attention to the old epic and the choice of characters, and of which it is the continuation. But Botardo's work, though good in plan, could never have achieved wide popularity on account of the extreme ruggedness of its style. Berni undertook the revision of the whole poem, avowedly altering no sentiment, removing or adding no incident, but simply giving to each line and stanza due gracefulness and polish. His task he completed with marvellous success; scarcely a line remains as it was, and the general opinion has pronounced decisively in favour of the revision over the original. To each canto he prefixed a few stanzas of reflective verse in the manner of Ariosto, and in one of these introductions he gives us the only certain information we have concerning his own life. Berni appears to have been favourably disposed towards the Reformation principles at that time introduced into Italy, and this may explain the bitterness of some remarks of his upon the church. The first edition of the *Raficamento* was printed posthumously in 1541, and it has been supposed that a few passages either did not receive the author's final revision, or have been retouched by another hand.

A partial translation of Berni's *Orlando* was published by W. S. Ross (1872–1873).

BERNICIA, the northern of the two English kingdoms which were eventually united in the kingdom of Northumbria. Its territory is said to have stretched from the Tyne northwards, ultimately reaching the Forth, while its western frontier was gradually extended at the expense of the Welsh. The chief royal residence was Bamburgh, and near it was the island of Lindisfarne, afterwards the see of a bishop. The first king of whom we have any record is Ida, who is said to have obtained the throne about 547. Æthelfrith, king of Bernicia, united Deira to his own kingdom, probably about 605, and the union continued under his successor Edwin, son of Ella or Ælle, king of Deira. Bernicia was again separate from Deira under Eanfrith, son of Æthelfrith (633–643), after which date the kings of Bernicia were supreme in Northumbria, though for a short time under Oswio Deira had a king of its own.

BERNICIAN SERIES, in geology, a term proposed by S. P. Woodward in 1856 (*Manual of Mollusca*, p. 409) for the lower portion of the Carboniferous System, below the Millstone Grit. The name was suggested by that of the ancient province of Bernicia on the Anglo-Scottish borderland. It is practically equivalent to the "Dinantien" of A. de Lapparent and Munier-Chalmas (1893). In 1875 G. Tate's "Calcareous and Carbonaceous" groups of the Carboniferous Limestone series of Northumberland were united by Professor Lear in a single series, to which he applied the name "Bernician"; but later he speaks of the whole of the Carboniferous rocks of Northumberland and its
Bernini—Bernoulli

803

Borders as of the "Bernian type," which is the most satisfactory way in which the term may now be used (Report of the Brit. Sub-committee on Classification and Nomenclature, 2nd ed., Cambridge, 1888). "Demelian" was the corresponding designation proposed by Woodward for the Upper Carboniferous rocks.

Bernini, Giovanni Lorenzo (1598–1680), Italian artist, was born at Naples. He was more celebrated as an architect and a sculptor than as a painter. At a very early age his great skill in modelling introduced him to court favour at Rome, and he was specially patronized by Maffeo Barberini, afterwards Pope Urban VIII., whose palace he designed. None of his sculptured groups at all come up to the promised excellence of his first efforts, the Apollo and Daphne, nor are any of his paintings of particular merit. His art, however, remained at a great height until his brother, being unable to have a personal interview with Bernini, sent him three portraits by Vandyck, from which the artist was enabled to complete his model. His architectural designs, including the great colonnade of St Peter's, brought him perhaps his greatest celebrity. Louis XIV., when he contemplated the restoration of the Louvre, sent for Bernini, but did not adopt his designs. The artist's progress through France was a triumphal procession, and he was most liberally rewarded by the great monarch. He left a fortune of over £500,000.

Bernis, François Joachim, sieur de (1715–1794). From French cardinal and statesman, was born at St Marcel-d'Arléche on the 22nd of May 1715. He was of a noble but impoverished family, and, being a younger son, was intended for the church. He was educated at the Louis-le-Grand college and the seminary of Saint-Sulpice, Paris, but did not take orders till 1755. He became known as one of the most expert epigrammatists in the gay society of Louis XV.'s court, and by his verses won the friendship of Madame de Pompadour, the royal mistress, who obtained for him an apartment, furnished at her expense, in the Tuileries, and a yearly pension of 1500 livres (about £60). In 1755 he was appointed to the French embassy at Vienna, where he acted, to the satisfaction of both parties, as mediator between the republic and Pope Benedict XIV. During his stay in Venice he received subdeacon's orders, and on his return to France in 1755 was made a papal councillor of state. He took an important part in the delicate negotiations between France and Austria which preceded the Seven Years' War. He regarded the alliance purely as a temporary expedient, and did not propose to employ the whole forces of France in a general war. But he was overruled by his colleagues. He became secretary for foreign affairs on the 27th of June 1757, but owing to his attempts to counteract the spendthrift policy of the marquis de Morando, was forced to resign and was in December 1758 banished to Soissons by Louis XV., where he remained in retirement for six years. In the previous November he had been created cardinal by Clement XIII. On the death of the royal mistress in 1764, Bernis was recalled and once more offered the seals of office, but declined them, and was appointed archbishop of Albi. His occupancy of the see was not of long duration. In 1769 he went to Rome to assist at the conclave which resulted in the election of Clement XIV., and the talent which he displayed on that occasion procured him the appointment of ambassador in Rome, where he spent the remainder of his life. He was partly instrumental in bringing about the suppression of the Jesuits, and acted with greater moderation than is generally allowed. He lost his influence under Pius VI., who was friendly to the Jesuits, and the French Revolution, to which he was hostile, reduced him almost to penury; the court of Spain, however, mindful of the support he had given to their ambassador in obtaining the condemnation of the Jesuits, came to his relief with a handsome pension. He died at Rome on the 3rd of November 1794, and was buried in the church of S. Luigi de' Francesi. In 1803 his remains were transferred to the cathedral at Naples. His poems, the longest of which is La Religion rendue a l'humanité (Parma, 1790), have not yet been set to music; they were collected and published after his death (Paris, 1797, &c.); his Mémoires et lettres 1715–58 (2 vols., Paris, 1898) are still interesting to the historian.

See Frédéric Masson's prefaces to the Mémoires et lettres, and Le Cardinale Berni (Paris, 1865, 2 vols., Ed. Goncourt, Mme de Pompadour (Paris, 1888), and Sainte-Beuve, Coursiers du bain, i., viii.

Bernkastel, a town of Germany, in the Prussian Rhine province, on the Mosel, in a deep and romantic valley, connected by a branch to Wernigerohr with the main Trier-Coblenz railway. Pop. 3624. It has an interesting market place and a romantic castle, the ruins of which is a wine, of which Berncastel Doctor enjoys great reputation. Above the town lie the ruins of the castle Landshut. Bernkastel originally belonged to the chapter of Trier, and received its name from one of the provosts of the cathedral, Adalbero of Luxemburg (hence Adalberonis castellum).

Bernoulli, or Bernoulli, the name of an illustrious family in the annals of science, who came originally from Antwerp. Driven from their country during the oppressive government of Spain for their attachment to the Reformed religion, the Bernoullis sought first an asylum at Frankfort (1583), and afterwards at Basel, where they ultimately obtained the highest distinctions. In the course of a century eight of its members successfully cultivated various branches of mathematics, and contributed powerfully to the advance of science. The most celebrated were Jacques (James), Jean (John) and Daniel, the first, second and fourth as dealt with below; but, for the sake of perspicuity they may be considered as nearly as possible in the order of family succession. A complete summary of the great developments of mathematical learning, which the Bernoullis of this family effected, lies outside the scope of this notice. More detailed accounts are to be found in the various mathematical articles.

I. Jacques Bernoulli (1654–1702), mathematician, was born at Basel on the 27th of December 1654. He was educated at the public school of Basel, and also received private instruction from the learned Hoffmann, then professor of Greek. At the conclusion of his philosophical studies at the university, some geometrical figures, which fell in his way, excited in him a passion for mathematical pursuits, and in spite of the opposition of his father, who wished him to be a clergyman, he applied himself particularly to his favourite science. In 1676 he visited Geneva on his way to France, and subsequently travelled to England and Holland. While at Geneva he taught a blind girl several branches of science, and also how to write; and this led him to publish A Method of Teaching Mathematics to the Blind. At Bordeaux his Universal Tables on Dialling were constructed; and in London he was admitted to the meetings of Robert Boyle, Robert Hooke and other learned and scientific men. On his final return to Basel in 1682, he devoted himself to physical and mathematical investigations, and opened a public seminar for the development of his new system. In 1685 he published his essay on optics, Conamen Novi Systematis Cometarum, which was occasioned by the appearance of the comet of 1680. This essay, and his next publication, entitled De Gratitate Aetheris, were deeply tinged with the philosophy of René Descartes, but they contain truths not unworthy of the philosophy of Sir Isaac Newton's Principia.

Jacques Bernoulli cannot be strictly called an independent discoverer; but, from his extensive and successful application of the calculus and other mathematical methods, he is deserving of a place by the side of Newton and Leibnitz. As an additional claim to remembrance, he was the first to solve Leibnitz's problem of the isochronous curve (Acta Eruditorum, 1690). He proposed the problem of the catenary (q.v.) or curve formed by a chain suspended by its two extremities, accepted Leibnitz's construction of the curve and solved more complicated problems relating to it. He determined the "elastic curve," which is formed by an elastic plate or rod fixed at one end and bent by a weight applied to the other, and which he showed to be the same as the curvature of an impervious silt filled with a liquid (linetaria). In his investigations respecting cycloidal lines and various spiral curves, his attention was directed to problems of the kind isochronous; in each of these he took particular interest from its remarkable property of reproducing itself under a variety of conditions.
In 1666 he proposed the famous problem of isoperimetric figures, and offered a reward for its solution. This problem engaged the attention of British as well as continental mathematicians; and its proposal gave rise to a painful quarrel with his brother Jean. Jean offered a solution of the problem; his brother pronounced it to be wrong. Jean then amended his solution, and again offered it, and claimed the reward. Jacques still declared it to be no solution, and soon after published his own. In 1701 he published also the demonstration of his solution, which was accepted by the marquis de l'Hôpital and Leibnitz. Jean, however, held his peace for several years, and then dishonestly published, after the death of Jacques, another incorrect solution; and not until 1718 did he admit that he had been in error. Even then he set forth as his own his brother's solution purposely disguised.

In 1697 the mathematical chair of the university of Basel was conferred upon Jacques. He was once made rector of his university, and had other distinctions bestowed on him. He and his brother Jean were the first two foreign associates of the Academy of Sciences of Paris; and, at the request of Leibnitz, they were both received as members of the academy of Berlin. In 1684 he had been offered a professorship at Heidelberg; but his marriage with a lady of his native city led him to decline the invitation. Intense application brought on infirmities and a slow fever, of which he died on the 16th of August 1705. Like another Archimedes, he requested that the logarithmic spiral should be engraved on his tombstone, with these words, *Eadem mutata resurgo.*

Jacques Bernoulli wrote elegant verses in Latin, German and French; but although these were held in high estimation in his own time, it is on his mathematical works that his fame now rests. These are—*Jacobi Bernoulli Basilianis Opera* (Genevae, 1744), 4 to.; *Ars Conjectandi, opus posthumum: acutissimo tractatus de Seriebus Infinitis, et epistola (Gallice scripta) de Ludo Pilaee Reticularius* (Basilae, 1713), 1 to. 4to.

II. JEAN BERNOLLI (1667-1748), brother of the preceding, was born at Basel on the 27th of July 1667. After finishing his literary studies he went to Neuchâtel to learn commerce and acquire the French language. But at the end of a year he renounced the pursuits of commerce, returned to the university of Basel, and was admitted to the degree of bachelor in philosophy, and a year later, at the age of 18, to that of master of arts. In his studies he was aided by his elder brother Jacques. Chemistry, as well as mathematics, seems to have been the object of his early attention; and in the year 1690 he published a dissertation on effervescence and fermentation. The same year he went to Geneva, where he gave instruction in the differential calculus to Nicolas Fatio de Duillier, and afterwards proceeded to Paris, where he was received into the society of N. Malebranche, J. Couplet, and Karl Philipp de Lahire and Pierre Varignon. With the marquis de l'Hôpital he spent four months studying higher geometry and the resources of the new calculus. His independent discoveries in mathematics are numerous and important. Among these were the exponential calculus, and the curve called by him the *linea brachistochrona,* or line of swiftest descent, which he was the first to determine, pointing out at the same time the relation which this curve bears to the path described by a ray of light passing through strata of variable density. On his return to his native country he was appointed to the chair of natural philosophy, and in 1703 took the degree of M.D. Although he had declined a professorship in Germany, he now accepted an invitation to the chair of mathematics at Groningen (*Commecium Philosophicum, epist. xi. et xii.*). There, in addition to the learned lectures by which he endeavoured to revive mathematical science in the university, he gave a public course of experimental physics. During a residence of ten years in Groningen, his controversies were almost as numerous as his discoveries. His dissertation on the "barometric light," first observed by Jean Picard, and discussed by Jean Bernoulli under the name of mercurial philosophy, of mercury shining in vacuo (*Dis. physica de mercuro lucente in vacuo*), procured him the notice of royalty, and engaged him in controversy. Through the influence of Leibnitz he received from the king of Prussia a gold medal for his supposed discoveries; but Nicolaus Hartsoeker and some of the French academicians disputed the fact. The family quarrel about the problem of isoperimetric figures above mentioned began about this time. In his dispute with his brother, in his controversies with the English and Scottish mathematicians, and in his harsh and jealous bearing to his son Daniel, he showed a mean, unfounded, and violent temper. He had declined, during his residence at Groningen; an invitation to Utrecht, but accepted in 1705 the mathematical chair in the university of his native city, vacant by the death of his brother Jacques; and here he remained till his death. His inaugural discourse was on the "new analysis," which he so successfully applied in investigating various problems both in pure and applied mathematics.

He was several times a successful competitor for the prizes given by the Academy of Sciences of Paris; the subjects of his essays were mechanics and physics. From the first mathematical age, as keen in his resentments as he was ardent in his friendships; fondly attached to his family, he yet disliked a deserving son; he gave full praise to Leibnitz and Leonard Euler, yet was blind to the excellence of Sir Isaac Newton. Such was the vigour of his constitution that he continued to pursue his usual mathematical studies till the age of eighty. He was then attacked by a complaint at first apparently trifling; but his strength daily and rapidly declined till the 1st of January 1748, when he died peacefully in his sleep.

His writings were collected under his own eye by Gabriel Cramer, professor of mathematics at Geneva, and published under the title of *Johannis Bernoulli Operi Omnia* (Lausun. et Genev.), 4 to.; his interesting correspondence with Leibnitz appeared under the title of *Gul. Leibniti et Johannis Bernoulli COMMERCII PHILOSOPHI ET MATHEMATICI* (Lausun. et Genev. 1745), 2 to. 4to.

III. NICOLAS BERNOLLI (1665-1726), the eldest of the three sons of Jean Bernoulli, was born on the 27th of January 1665. At the age of eight he could speak German, Dutch, French and Latin. When his father returned to Basel he went to the university of that city, where, at the age of sixteen, he took the degree of doctor in philosophy, and four years later the highest degree in law. Meanwhile the study of mathematics was not neglected, as he applied not only from his giving instruction in geometry to his younger brothers, the level of a motion (*Lettres sur les lois de la deceleration*); or algorithms in the differential, integral, and exponential calculus, and from his father considering him, at the age of twenty-one, worthy of receiving the torch of science from his own hands. ("Lampada nunc tradam filio meo natu maximo, juveni xxi. annorum, ingenio mathematico alisque dotibus satis instructo," *Com. Phil.* ep. 223.) With his father's permission he visited Italy and France, and during his travels formed friendship with Pierre Varignon and Count Riccatti. The invitation of a Venetian nobleman induced him again to visit Italy, where he resided two years, till his return to be a candidate for the chair of jurisprudence at Basel. He was unsuccessful, but was soon afterwards appointed to a similar office in the university of Bern. Here he resided three years, his happiness only marred by regret on account of his separation from his brother Daniel. Both were appointed at the same time professors of mathematics in the academy of St. Petersburg; but this office Nicolas enjoyed for little more than eight months. He died on the 26th of July 1726 of a lingering fever. Sensible of the loss which the nation had sustained by his death, the empress Catherine ordered him a funeral at the public expense.

Some of his papers are published in his father's works, and others in the *Acta Eruditorum* and the *Comment. Acad. Petropol.*
IV. DANIEL BERNOLLI (1700–1782), the second son of Jean Bernoulli, was born on the 29th of January 1700, at Groningen. He studied medicine and became a physician, but his attention was early directed also to geometrical studies. The severity of his father's manner was ill-calculated to encourage the first efforts of one so sensitive; but fortunately, at the age of eleven, he became the pupil of his brother Nicola. He afterwards studied in Italy under Francesco Domenico Michelotti and Giambattista Morgagni. After his return, though only twenty-four years of age, he was invited to become president of an academy then projected at Genoa; but, declining this honour, he was, in the following year, appointed professor of mathematics at St Petersburg. In consequence of the state of his health, however, he returned to Basel in 1733, where he was appointed professor of anatomy and botany, and afterwards of experimental and speculative philosophy. In the labours of this office he spent the remaining years of his life. He had previously published some medical and botanical dissertations, besides his Exercitaciones quaedam Mathematicae, containing a solution of the differential equation proposed by Riccati and now known by his name. In 1738 appeared his Hydrodynamica, in which the equilibrium, the pressure, the reaction and varied velocities of fluids are considered both theoretically and practically. One of these problems, illustrated by experiment, deals with an ingeniously modified version of Pascal's principal use of waterjets by the stern. Some of his experiments on this subject were performed before Pierre Louis M. de Maupertuis and Alexis Claude Clairaut, whom the fame of the Bernoullis had attracted to Basel. With a success equalled only by Leonhard Euler, Daniel Bernoulli gained or shared no less than ten prizes of the Academy of Sciences of Paris. The first, for a memoir on the construction of a clepsydra for measuring time exactly at sea, he gained at the age of twenty-four; the second, for one on the physical cause of the inclination of the planetary orbits, he divided with his father; and the third, for the description of his experiments on waves, he shared with Euler, Colin Maclaurin and another competitor. The problem of vibrating cords, which had been some time before resolved by Brook Taylor (1685–1731) and d'Alembert, became the subject of a long discussion conducted in a generous spirit between Bernoulli and his friend Euler. In one of his early investigations he gave an ingenious though indirect demonstration of the problem of the parallelogram of forces. His labours in the decline of life were chiefly directed to the doctrine of probabilities in reference to practical purposes, and in particular to economical subjects, as, for example, to inoculation, and to the estimation of the life insurance. He divided the legal ages at which men and women were permitted to marry, on the relative proportion of male and female births. He retained his usual vigour of understanding till near the age of eighty, when his nephew Jacques relieved him of his public duties. He was afflicted with asthma, and his retirement was relieved only by the society of a few chosen friends. He died on the 17th of March 1782 at Basel. Excluded by his professional character from the councils of the republic, he nevertheless received all the deference and honour due to a first magistrate. He was wont to mention the following as the two incidents in his life which had afforded him the greatest pleasure: for a stranger, whom he had met as a traveler on the continent, in his youth, made to his declaration "I am Daniel Bernoulli," the incredulous and mocking reply, "And I am Isaac Newton;" and that, while entertaining König and other guests, he solved without rising from table a problem which that mathematician had submitted as difficult and lengthy. Like his father, he was a member of almost every learned society of Europe, and he succeeded him as foreign associate of the Academy of Paris.

Several of his investigations are contained in the earlier volumes of the Comment. Acad. Petrop., and his separately published works are:—Dissertatio inaugural. Phys. Med. de Respirations (Basil. 1721), 4to: Positiones Anatomico-Boleticae (Basil. 1721), 4to; Exercitaciones quaedam Mathematicae (Venetiis, 1724), 4to; Hydrodynamica (Archives of Basle, 1730). 

V. JEAN BERNOLLI (1710–1750), the youngest of the three sons of Jean Bernoulli, was born at Basel on the 18th of May 1710. He studied law and mathematics, and, after travelling in France, was for five years professor of eloquence in the university of his native city. On the death of his father he succeeded him as professor of mathematics. He was thrice a successful competitor for the prizes of the Academy of Sciences of Paris. His prize subjects were the capstan, the propagation of light, and the magnet. He enjoyed the friendship of P. L. M. de Maupertuis, who died under his roof while on his way to Berlin. He himself died in 1790. His two sons, Jean and Jacques, are the last noted mathematicians of the family.

VI. NICOLAS BERNOLLI (1687–1759), cousin of the three preceding, and son of Nicolas Bernoulli, one of the senators of Basel, was born in that city on the 10th of October 1687. He visited England, where he was kindly received by Sir Isaac Newton and Edmund Halley (Com. Phil. ep. 199), held for a time the mathematical chair at Padua, and was successively professor of logic and of law at Basel, where he died on the 29th of November 1759. He was editor of the Ars Conjectandi of his uncle Jacques. His own works are contained in the Acta Eruditorum, the Gionrale de letterati d'Italia, and the Commercium Philosophicum.

VII. JEAN BERNOLLI (1744–1807), grandson of the first Jean Bernoulli, and son of the second of that name, was born at Basel on the 4th of November 1744. He studied at Basel and at Neuchâtel, and when thirteen years of age took the degree of doctor in philosophy. At nineteen he was appointed astronomer royal of Berlin. Some years after, he visited Germany, France and England, and subsequently Italy, Russia and Poland. On his return to Berlin he was appointed director of the mathematical department of the academy. Here he died on the 13th of July 1807. His writings consist of travels and astronomical, geographical and mathematical works. In 1774 he published a French translation of Leonhard Euler's Elements of Algebra. He contributed several papers to the Academy of Berlin.

BERNSTEIN, AARON (1812–1884), Jewish scientist, author and reformer. In the middle of the 19th century Bernstein took an active share in the movement for synagoge reform in Germany. He was the author of two delightful Ghetto stories, Vigel der Maggid and Mendel Ghabbor, being one of the originators of this genre of modern fiction. He was also a publicist, and his History of Revolution and Reaction in Germany (3 vols., 1883–1884) was a collection of important political essays.
BERNSTORFF, ANDREAS PETER, Count von (1735-1797), Danish statesman, was born at Hanover on the 28th of August 1735. His career was determined by his uncle, Johann Hartwig Ernst Bernstorff, who early discerned the talents of his nephew and induced him to study in the German and Swiss universities and to travel for some years in Italy, France, England and Holland, to prepare himself for a statesman's career. During these Wanderjahre he made the acquaintance of the poets Gellert and Jacobi, the learned Jean-Jacques Barthélemy, the duc de Choiseul, and Gottfried Achenwall, the statistician. At his uncle's desire he rejected the Hanoverian for the Danish service, and in 1759 took his seat in the German chancery at Copenhagen. In 1767, at the same time as his uncle, he was created a count, and in 1769 was made a privy-councillor. He is described in this period as intellectual, upright and absolutely trustworthy, but obstinate and self-opinionated to the highest degree, arguing with antiquaries about coins, with equerries about horses, and with foreigners about their own countries, always certain that he was right and they wrong, whatever the discussion might be. He shared the disgrace of his uncle when Struensee came into power, but re-entered the Danish service after Struensee's fall at the end of 1772, working at first in the financial and economical departments, and taking an especial interest in agriculture. The improvements he introduced in the tenures of the crown, and his agitation in some respects the agricultural reforms of the next generation.

In April 1773 Bernstorff was transferred to the position for which he was especially fitted, the ministry of foreign affairs, with which he combined the presidency of the German chancery (for Schleswig-Holstein). His predecessor, Adolf Siegfried Osten, had been dismissed because he was not persona grata at St Petersburg, and Bernstorff's first official act was to conclude the negotiations which had long been pending with the grand-duke Paul as duke of Holstein-Gottorp. The result was the exchange-treaty of 21st June 1773, May 21, 1773, confirmed the previous treaty of 1767 (see Bernstorff, J. H. E.). This was followed by the treaty of alliance between Denmark and Russia of the 12th of August 1773, which was partly a mutually defensive league, and partly an engagement between the two states to upset the new constitution recently established in Sweden by Gustavus III., when the right moment for doing so should arise. For this mischievous and immoral alliance, which bound Denmark to the wheels of the Russian empress's chariot and sought to interfere in the internal affairs of a neighbouring state, Bernstorff was scarcely responsible, for the preliminaries had been arranged by his uncle, and he had only carried them. But there can be no doubt that he regarded this anti-Swedish policy as the correct one for Denmark, especially with a monarch like Gustavus III. on the Swedish throne. It is also pretty certain that the anti-Swedish alliance was Russia's price for compounding the Gottorp difficulty.

Starting from the hypothesis that Sweden was "Denmark-Norway's most active and irreconcilable enemy," Bernstorff logically included France, the secular ally of Sweden, among the hostile powers with whom an alliance was to be avoided, and drew near to Great Britain as the natural foe of France, especially during the American War of Independence, and this too despite the irritation occasioned in Denmark-Norway by Great Britain's masterful interpretation of the expression "contraband." Bernstorff's sympathy with England grew stronger still when in 1779 Spain joined her enemies; and he was much inclined, the same winter, to join a triple alliance between Great Britain, Russia and Denmark-Norway, proposed by England for the purpose of compelling the Bourbon powers to accept reasonable terms of peace. But he was overruled by the crown prince Frederick, who thought such a policy too hazardous, when Russia declined to have anything to do with it. Instead of this the Russian chancellor Nikolai Panin proposed an armed league to embrace all the neutral powers, for the purpose of protecting neutral shipping in time of war. This league was very similar to one proposed by Bernstorff himself in September 1778 for enforcing the principle "a free ship makes the cargo free"; but as now presented by Russia, he rightly regarded it as directed exclusively against England. He acceded to it indeed (6th of July 1780) because he could not help doing so; but he had previously, by a separate treaty with England, on the 4th of July, come to an understanding with that power both to the meaning of the expression "contraband of war." This independence caused great wrath at St Petersburg, where Bernstorff was accused of disloyalty, and ultimately sacrificed to the resentment of the Russian government (7th of November 1780), the more readily as he already disagreed on many important points of domestic administration with the prime minister Hoegg Guldberg. He retired to his Mecklenburg estates, but on the fall of Guldberg four years later, was recalled to office (April 1784). The ensuing thirteen years were perhaps the best days of the old Danish absolutism. The government, under the direction of such enlightened ministers as Bernstorff, Reventlow and others, held the mean between Struensee's extravagant cosmopolitanism and Guldberg's still conservatism. In such noble projects of reform as the emancipation of the serfs (see REVENTLOW) Bernstorff took a leading part, and so closely did he associate himself with everything Danish, so popular did he become in the Danish capital, that a Swedish diplomatist expressed the opinion that henceforth Bernstorff could not be removed without danger. Liberal-minded as he was, he held that "the will of the nation should be the law" and he firmly upheld the freedom of the press as the surest of safety-valves.

Meanwhile foreign complications were again endangering the position of Denmark-Norway. As Bernstorff had predicted, Panin's neutrality project had resulted in a breach between Great Britain and Russia. Then came Gustavus III.'s sudden war with Russia in 1788. Bernstorff was bound by treaty to assist Russia in such a contingency, but he took care that the assistance so rendered should be as trifling as possible, to avoid offending Great Britain and Prussia. Still more menacing became Britain's policy on the question of the French Revolution. Ill-disposed as Bernstorff was towards the Jacobins, he now condemned on principle any interference in the domestic affairs of France, and he was persuaded that Denmark's safest policy was to keep clear of every anti-French coalition. From this unassailable standpoint he never swerved, despite the promises and even the menaces both of the eastern and the western powers. He was rewarded with complete success and the respect of all the diplomats in Europe. His neutrality treaty with Sweden (17th of March 1794), for protecting their merchantmen by combined squadrons, was also extremely beneficial to the Scandinavian cause. He mediated in personal and politically. Taught by the lesson of Poland, he had, in fact, long since abandoned his former policy of weakening Sweden. Bernstorff's great faculties appeared, indeed, to mature and increase with age, and his death, on the 21st of June 1797, was regarded in Denmark as a national calamity.

Count Bernstorff was twice married, his wives being the two sisters of the writers Counts Christian and Friedrich Leopold zu Stolberg. He left seven sons and three daughters. Of his sons the best known is Christian Günther, count von Bernstorff. Another, Count Joachim, was attached to his brother's fortunes so long as he remained in the Danish service, was associated with him in representing Denmark at the congress of Vienna, and in 1815 was appointed ambassador at that court.

P. Bernstorff og O. Hoegg-Guldberg (Copenhagen, 1899); and Bernstorffs Selskabs Afdeling (København, 1863). (R. N. B.)

BERNSTORFF, CHRISTIAN GÜNTER, Count von (1769-1835), Danish and Prussian statesman and diplomatist, son of Count Andreas Peter von Bernstorff, was born at Copenhagen on the 3rd of April 1769. Educated for the diplomatic service under his father's direction, he began his career in 1787, as attaché to the representative of Denmark at the opening of the Swedish diet. In 1789 he went as secretary of legation to Berlin,
where his maternal uncle, Count Leopold Friedrich zu Stolberg, was Danish ambassador. His uncle's influence, as well as his own social qualities, obtained him rapid promotion; he was soon chargé d'affaires, and in 1791 minister plenipotentiary.

In 1794 he exchanged this post for the important one of ambassador at Stockholm, where he remained until May 1797, when he was summoned to Copenhagen to act as substitute for his father during his illness. On the death of the latter (21st June), he succeeded him as secretary of state for foreign affairs and privy councillor. In 1800 he became head of the ministry. He remained responsible for the foreign policy of Denmark until May 1810, a fateful period which saw the battle of Copenhagen (2nd of April 1801), the bombardment of Copenhagen and capture of the Danish fleet in 1807. After his retirement he remained without office until his appointment in 1811 as Danish ambassador at Vienna. He remained here, in spite of the fact that for a while Denmark was nominally at war with Austria, until, in January 1814, on the accession of Denmark to the coalition against Napoleon, he publicly resumed his functions as ambassador. He accompanied the emperor Francis to Paris, and was present at the signature of the peace of Paris. With his brother Joachim, he represented Denmark at the congress of Vienna and, as a member for the commission for the regulation of the affairs of Germany, was responsible for some of that confusion of Danish and German interests which was to bear bitter fruit later in the Schleswig-Holstein question (q.v.). He again accompanied the allied sovereigns to Paris in 1815, returning to Copenhagen the same year. In 1817 he was appointed Danish ambassador at Berlin, his brother Joachim going at the same time to Vienna. In the following year Prince Heinrich was made minister of the formal foreign office, and he should transfer his services to Prussia, which, with the consent of his sovereign, he did.

It was, therefore, as a Prussian diplomat that Bernstorff attended the congress of Aix-la-Chapelle (October 1818), at the close of which he returned to Berlin as minister of state and head of the department for foreign affairs. Bernstorff's management of Prussian policy during the many years that he remained in office has been variously judged. He was by training and temperament opposed to the Revolution, and he was initiated into his new duties as a Prussian minister by the reactionary Ancillon. He is accused of having subordinated the particular interests of Prussia to the European policy of Metternich and the "Holy Alliance." Whether any other policy would in the long run have served Prussia better is a matter for speculation.

It is true that Bernstorff supported the Carlsbad decrees, and the Vienna Final Act; he was also the faithful henchman of Metternich at the congresses of Laibach, Troppau and Verona. On the other hand, he took a considerable share in laying the foundations of the customs union (Zollverein), which was destined to be the foundation of the Prussian hegemony in Germany. In his support of Russia's action against Turkey in 1828 also he showed that he was no blind follower of Metternich's views. In the crisis of 1830 his moderation in face of the warlike clout of the military party at Berlin did much to prevent the troubles in Belgium and Poland from ending in a universal European conflagration.

From 1824 onward Bernstorff had been a constant sufferer from hereditary gout, intensified and complicated by the results of overwork. In the spring of 1832 the state of his health compelled him to resign the ministry of foreign affairs to Ancillon, who had already acted as his deputy for 2 years. He died on the 18th of March 1835.

BERNSTORFF, JOHANN HARTWIG ERNST, COUNT VON (1712-1772), Danish statesman, who came of a very ancient Mecklenburg family, was the son of Joachim Engelke, Freiherr von Bernstorff, chamberlain to the elector of Hannover, and was born on the 10th of May 1712. His maternal grandfather, Andreas Gottlieb Bernstorff (1640-1726), had been one of the ablest ministers of George L., and under his guidance Johann was very carefully educated, acquiring amongst other things that intimate knowledge of the leading European languages, especially French, which ever afterwards distinguished him. He was introduced into the Danish service by his relations, the brothers Plessen, who were ministers of state under Christian VI. In 1732 he was sent on a diplomatic mission to the court of Dresden; and from 1738 he represented Holstein at the diet of Regensburg, from 1744 to 1750 he represented Denmark at Paris, whence he returned in 1754 to Denmark as minister of foreign affairs. Supported by the powerful favourite A. G. B. Ancillon, and highly respected by Frederick V., he occupied for twenty-one years the post of foreign minister, and under which the council of state his opinion was decisive. But his chief concern was with foreign affairs. Ever since the conclusion of the Great Northern War, Danish statesmen had been occupied in harvesting its fruits, namely, the Gottorp portions of Schleswig definitely annexed to Denmark in 1721 by the treaty of Nystad, and endeavouring to bring about a definitive general understanding with the house of Gottorp as to their remaining possessions in Holstein. With the head of the Swedish branch of the house of Gottorp, Adolphus Frederick, things had been arranged by the exchange of Pommern, to make a similar arrangement with the chief of the elder Gottorp line, the cesarevitch Peter Feodorovich, had failed. In intimate connexion with the Gottorp affair stood the question of the political equilibrium of the north. Ever since Russia had become the dominant Baltic power, as well as the state to which the Gottorps looked primarily for help, the necessity for a better understanding between the two Scandinavian kingdoms had clearly been recognized by the best statesmen of both, especially in Denmark from Christian VI's time; but unfortunately this sound and sensible policy was seriously impeded by the survival of the old national hatred on both sides of the Sound, still further complicated by Gottorp's hatred of Denmark. Moreover, it was a diplomatic axiom in Denmark, founded on experience, that an absolute monarchy in Sweden was incomparably more dangerous to her neighbours than a limited monarchy, and after the collapse of Swedish absolutism with Charles XII., the upholding of the comparatively feeble, and ultimately anarchical, parliamentary government of Sweden became a question of principle with Danish statesmen throughout the 18th century. A friendly alliance with a relatively weak Sweden was the cardinal point of Bernstorff's policy. But his plans were traversed again and again by unforeseen complications, the failure of the most promising presumptions, the perpetual shifting of apparently stable alliances; and again and again he had to modify his means to attain his ends. Amidst all these perplexities Bernstorff approved himself a consummate statesman. It seemed almost as if his wits were sharpened into a keener edge by his very difficulties; but since he condemned on principle every war which was not strictly defensive, and it had fallen to his lot to guide a comparatively small power, he always preferred the way of negotiation, even sometimes where the diplomatic tangle would perhaps best have been severed boldly by the sword. The first difficult problem he had to face was the Seven Years' War. He was determined to preserve the neutrality of Denmark at any cost, and this he succeeded in doing, despite the existence of a subsidy-treaty with the king of Prussia, and the suspicions of England and Sweden. It was through his initiative, too, that the convention of Kloster-Seven was signed (10th of September 1757), and on the 4th of May 1758 he concluded the still more promising treaty with France, whereby, in consideration of Denmark's holding an army-corps of 24,000 men in Holstein till the end of the war, to secure Hamburg, Lübeck and the Gottorp part of Holstein from invasion, France, and ultimately Austria also, engaged to bring about an exchange between the king of Denmark and the cesarevitch, as regards Holstein. But the course of the war made this compact inoperative. Austria hastened to repudiate her guarantee to Denmark in order not to offend the new emperor of Russia, Peter III., and one of Peter's first acts on ascending the throne was to declare war against Denmark. The coolness
and firmness of Bernstorff saved the situation. He protested that the king of Denmark was bound to defend Schleswig "so long as there was a sword in Denmark and a drop of blood in the veins of the Danish people." He rejected the insulting ultimatum of the Russian emperor. He placed the best French general of the day at the head of the well-equipped Danish army. But just as the Russian and Danish armies had come within striking distance, the tidings reached Copenhagen that Peter III. had been overthrown by his consort. Bernstorff was one of the first to recognize the impotence of the French monarchy after the Seven Years' War, and in 1763 he considered it expedient to exchange the French for the Russian alliance, which was cemented by the treaty of the 28th of April (March 11) 1765. This compact engaged Denmark to join with Russia in upholding the existing Swedish constitution, in return for which Catherine II. undertook to adjust the Gottorp difficulty by the cession of the Gottorp portion of Holstein in exchange for the counties of Oldenburg and Delmenhorst. For his part in this treaty Bernstorff was created count. On the accession of Christian VII., in 1776, Bernstorff's position became very precarious, and he was exposed to all manner of attacks, being accused, without a shadow of truth, of exploiting Denmark, and of unduly promoting foreigners. It is remarkable, however, that though Bernstorff ruled Denmark for twenty years he never learnt Danish. His last political achievement was to draw still closer to Russia by the treaty of the 13th of December 1769, the most important paragraph of which stipulated that any change in the Swedish constitution should be regarded by Denmark and Russia as a casus belli against Sweden, and that in the event of such a war Denmark should retain all the territory conquered from Sweden. This treaty proved to be a great mistake on Denmark's part, but circumstances seemed at the time to warrant it. Nine months later, on the 30th of September 1770, Bernstorff was dismissed as the result of Struensee's intrigues, and, rejecting the brilliant offers of Catherine II. if he would enter the Russian service, retired to his German estates, where he died on the 18th of February 1772. Bernstorff was not only one of the ablest but one of the noblest and most conscientious statesmen of his day. The motto he chose on receiving the order of the Dannebrog was "Integritas et rectum custodiunt me;" and throughout a long life he was never false to it.

See Poul Vedel, Den ældre Greg Bernstorffs ministerium (Copenhagen, 1882); Correspondance ministérielle du Comte J. H. E. Bernstorff, ed. Vedel (Copenhagen, 1882); Aage Friis, Bernstorffs Danske Ministerium (Copenhagen, 1899). (R. N. B.)

BEROSSUS, a priest of Bel at Babylon, who translated into Greek the standard Babylonian work on astrology and astronomy, and compiled (in three books) the history of his country from native documents, which he published in Greek in the reign of Antiochus II. (250 B.C.). His works have perished, but extracts from the history have been preserved by Josephus and Eusebius, the latter of whom probably derived them not directly from Berossus, but through the medium of Alexander Polyhistor and Apollodorus. The extracts containing the Babylonian cosmology, the list of the antediluvian kings of Babylonia, and the Chaldaean story of the Deluge, have been shown by the decipherment of the cuneiform texts to have faithfully reproduced the native legends; we may, therefore, conclude that the rest of the History was equally trustworthy. On the other hand, a list of post-diluvian dynasties, which is quoted by Eusebius and Georgius Syncellus as having been given by Berossus, cannot, in its present form, be reconciled with the monumental facts, though a substratum of historical truth is discoverable in it. As it stands:

1. 86 Chaldaean kings 34,080 or 33,091 years.
2. 8 Median 
3. 11 other kings 0 number.
4. 49 Chaldean 
5. 9 Arabian 
6. 45 Assyrian 

After these, according to Eusebius, came the reign of Ptolemy. By means of an ingenious chronological combination, the several items of which, however, are very questionable, J. A. Brandis assigned 258 years to the 3rd dynasty; other summations have been proposed with equally little assurance of certainty. If Eusebius can be trusted, the 6th dynasty ended in 729 B.C., the year in which Pto or Tigrath-pileser III. was crowned king of Babylonia. But all attempts to harmonize the scheme of dynasties thus ascribed to Berossus with the list given us in the so-called dynastic Tablets discovered by Dr Pinches have been failures. The numbers, whether of kings or of years, cannot have been handed down to us correctly by the Greek historian, for all this is Berossus's account of Babylonia so far as it should fill the astronomical period of 36,000 years, beginning with the first man and ending with the conquest of Babylon by Alexander the Great.

Lenormant, Essai de commencer des fragments cosmogoniques de Beroèse (1872); A. von Gutschmidt in the Rheinisches Museum (1853); George Smith in T. S.B.A. iii., 1874, pp. 367-379; Th. G. Pinches in P.S.B.A. 1880-1881. (A. H. S.)

BERRY, CHARLES ALBERT (1852-1899), English non-conformist divine, was born on the 14th of December 1852 at Bradshawgate, Leigh, Lancashire. He played an active part in Congregationalism, to which he devoted himself in fullness of time, and from 1875 onwards he was the pastor of St George's Road Congregational church, Bolton. He was known as a man of administrative ability, a vigorous platform speaker and an eloquent preacher. In July 1883 he undertook the pastorate of the church at Queen Street, Wolverhampton, with the supervision of nine dependent churches in the neighbourhood. Here again he exercised a wide influence, due in part to his evangelical conviction, eloquence, broad views and powers of organization, but also to the magnetic force of his personality. In 1887 he went to America in fulfilment of a promise to Henry Ward Beecher of Brooklyn, and received a unanimous invitation to succeed Beecher in what was then the best-known pulpit in the United States. Berry, however, felt that his work lay in England and declined the invitation. In 1892 he took part in a conference at Grindelwald on the question of Christian Reunion, and subsequently, with Hugh Price Hughes and Alexander Mackenial of Bowdon, conducted a campaign throughout England, introducing the ideas and principles of Free Church federation. He was the first president of the Congregational-Union of England and Wales. In 1898 his health began to fail, and he died suddenly on the 31st of January 1899. His published works consist chiefly of addresses, and two volumes of sermons, Vision and Duty, and Ministration of Grace. (D. M.)

BERRY, CHARLES FERDINAND, DUKE OF (1778-1820), younger son of Charles X. of France, was born at Versailles. At the Revolution he left France with his father, then comte d'Artois, and served in the army of Condé from 1792 to 1797. He afterwards joined the Russian army, and in 1801 took up his residence in England, where he remained for thirteen years. During that time he married an Englishwoman, Anna Brown, by whom he had two daughters, afterwards the baronne de Charette and the comtesse de Lucinge-Fauquemberguy. The marriage was cancelled for political reasons in 1814, when the duke set out for France. He, however, managed to retain his favour with his countrymen, and Louis XVIII. named him command-in-chief of the army at Paris on the return of Napoleon from Elba. He was, however, unable to retain the loyalty of his troops, and retired to Ghent during the Hundred Days. In 1816 he married the princess Caroline Ferdinande Louise (1798-1870), eldest daughter of King Francis I. of Naples. On the 13th of February 1820 he was mortally wounded, when leaving the opera-house at Paris with his wife, by a Saddler named Louis Pierre Louvel. Seven months after his death the duchess gave birth to a son, who received the title of duke of Bordeaux,
but who is known in history as the comte de Chambord. A daughter, afterwards duchess of Parma, was born in 1819.

The duchess of Berry was compelled to follow Charles X. to Holyrood after July 1830, but it was with the resolution of returning speedily and making an attempt to secure the throne for her son. From England she went to Italy, and in April 1832 she landed near Marseilles, but, receiving no support, was compelled to make her way towards the loyal districts of Vendée and Anjou. She and her followers were captured at Angers, and, after remaining concealed for five months in a house in Nantes, she was betrayed to the government and imprisoned in the castle of Blaye. Here she gave birth to a daughter, the fruit of a secret marriage contracted with an Italian nobleman, Count Etto Lucchesi-Palli (1805-1864). The announcement of this marriage at once deprived the duchess of the sympathies of her supporters. She was no longer an object of fear to the French government, who released her in June 1833. She set sail for Sicily, and, joining her husband, lived in retirement to the time till her death, at Brunnenburg, Switzerland, on November 13, 1845.

BERRY, JOHN, DUKE OF (1340-1416), third son of John II., king of France and Bonne of Luxemburg, was born on the 30th of November 1340 at Vincennes. He was created count of Poitiers in 1356, and was made the king's lieutenant in southern France, though the real power rested chiefly with John of Armagnac, whose daughter Jeanne he married in 1360. The loss of his southern possessions by the treaty of Bretigny was compensated by the fiefs of Auvergne and Berry, with the rank of peer of France. The duchy went to England in 1360 as a hostage for the fulfilment of the treaty of Bretigny, returning to France on John's death on the pretext of collecting his ransom. He took no leading part in the war against the English, his energies being largely occupied with the satisfaction of his artistic and luxurious tastes. For this reason perhaps his brother Charles V. assigned him no share in the government during the minority of Charles VI. He received, however, the province of Languedoc. The peasant revolt of the Tuchins and Coquins, as the insurgents were called, was suppressed with great harshness, and the duke exacted from the states of Languedoc assembled at Lyons a fine of £15,000. He fought at Rosebeke in 1382 against the Flemings and lent to the duke of Burgundy the castle of Montauban. By a series of delays he caused the failure of the naval expedition prepared at Sluys against England in 1386, and a second accusation of military negligence led to disgrace of the royal princes and the temporary triumph of the marmousets, as the advisers of the late king were nicknamed. Charles VI. visited Languedoc in 1389-1390, and enquired into his uncle's government. The duke was deprived of the government of Languedoc, and his agent, Bétizac, was burnt. When in 1401 he was restored, he delegated his authority in the province, where he was still hated, to Bérand d'Armagnac. In 1396 he negotiated a truce with Richard II. of England, and his marriage with the princess Isabella of France. He tried to mediate between his brother Philip the Bold of Burgundy and his nephew Louis, duke of Orleans, and later between John "sans Peur" of Burgundy and Orleans. He broke with John after the murder of Orleans, though he tried to prevent civil war, and only finally joined the Armagnac party in 1410. In 1413 he resumed his rôle of mediator, and was for a short time tutor to the dauphin. He died in Paris on the 15th of June 1416, leaving vast treasures of jewelry, objects of art, and especially of illuminated MSS., many of which have been preserved, and decorated the Sainte Chapelle at Bourges; he bought the Hôtel de Neale in Paris, and palaces at Poitiers, Bourges, Mounier-Yèvre and elsewhere.

See also L. Raynal, "Histoire du Berry" (Bourges, 1845); "Jean, duc de Berry," in S. Luce, "La France pendant la guerre de Cent Ans" (1800), vol. i.; "Toujoul-Thisle" in H. Buonarroti, "La Société des Sciences du Centre," vol. viii. (1806). His beautiful illuminated Livre d'heures was reproduced (Paris, fol. 1904) by P. Durieux.

BERRY, or BERRY, a former province of France, absorbed in 1790 in the departments of Cher, corresponding roughly with Haut-Berry, and Indre, representing Bas-Berry. George Sand, the most famous of "berrichon" writers, has described the quiet scenery and rural life of the province in the rustic novels of her later life. Berry is the cièsas or pagues Biturigis of Gregory of Tours. The Bituriges were said by Livy (v. 34) to have been the dominating tribe in Gaul in the 7th century, one of their kings, Ambigait, having ruled over all Gaul. In Caesar's time they were dependent on the Aedui. The tribes inhabiting the districts of Berry and Bourbannais were distinguished as Bituriges Cubi. The numerous menhirs and dolmens to be found in the district, to which local superstitions still cling, are probably monuments of still earlier inhabitants. In 52 B.C. the Bituriges, at the order of Vercingetorix, set fire to their towns, but spared Bourges (Avaricum) their capital, which was taken and sacked by the Romans. The province was amalgamated under Augustus with Aquitaine, and Bourges became the capital of Aquitania Prima. In 475 Berry came into the possession of the west Goths, from whom it was taken (c. 597) by Clovis. The first count of Berry, Chilubert (d. 763), was created by Wulfer, duke of Aquitaine, from whom the county was wrested by Pipinn the Short, who made it his residence and gave it to his son Carloman, on whose death it fell to his brother Charlemagne. The counts of Berry were suppressed (926) by Rudolph, king of the Franks (fl. 923-936). Berry was at some time a group of lords'hip dependent directly on the crown, but the chief authority eventually passed to the viscounts of Bourges, who, while owning the royal suzerainty, preserved a certain independence until 1101, when the viscount Odo Arpin de Dun sold his fief to the crown. Berry was part of the dowry of Eleanor, wife of Louis VII., and on her divorce and remarriage with Henry II. of England it passed to the English king. Its possession remained, however, a matter of dispute until 1200, when Berry reverted by treaty with John of England to Philip Augustus, and the various fiefs of Berry were given as a dowry to John's niece, Blanche of Castile, on her marriage with Philip's son Louis (afterwards Louis VIII.). Philip Augustus established an effective control over the administration of the province by the appointment of a royal bailli. Berry suffered during the Hundred Years' War, and more severely during the wars of religion in the 16th century. It had been made a duchy in 1360, and its first duke, John [Jean] (1340-1416), son of the French king John II., encouraged the arts and beautified the province with money wrung from his government of Languedoc. Thenceforward it was held as an appanage of the French crown, usually by a member of the royal family closely related to the king. Charles of France (1447-1472), brother of Louis XI., was duke of Berry, but was deprived of this province, as subsequently by the duchies of Normandy and Guienne, for intrigues against his brother. The duchy was also governed by Jeanne de Valois (d. 1505), the repudiated wife of Louis XII.; by Marguerite d'Angoulême, afterwards queen of Navarre; by Marguerite de Valois, afterwards duchess of Savoy; and by Louise of Loraine, widow of Henry III., after whose death (1601) the province was finally reabsorbed in the royal domain. The title of duke of Berry, divested of territorial significance, was held by princes of the royal house. Charles (1668-1714), duke of Berry, grandson of Louis XIV., and third son of the dauphin Louis (d. 1711), married Marie Louise Elisabeth (1668-1714), eldest daughter of the duke of Orleans, whose intrigues made her notorious. The last to bear the title of duke of Berry was the ill-fated Charles Ferdinand, grandson and heir of Charles X.

BERRYER, ANTOINE PIERRE (1790-1868). French advocate and parliamentary orator, was the son of an eminent advocate and counselor to the king. He educated at the Collège de Juilly, on leaving which he adopted the profession of the law; he was admitted advocate in 1811, and in the same year he married. In the great conflict of the period between Napoleon I. and the Bourbons, Berryer, like his father, was an ardent Legitimist; and in the spring of 1815, at the opening of the campaign of the Hundred Days, he followed Louis XVIII. to Ghent as a volunteer. After the second restoration he distinguished himself as a courageous advocate of moderation in the treatment of the military adherents of the emperor. He

---

1 See R. le Maule, "Jeanne de France, duchesse d'Orléans et de Berry" (Paris, 1885).
assisted his father and Dupin in the unsuccessful defence of Marshal Ney before the chamber of peers; and he undertook alone the defence of General Cambronne and General Debeille, procuring the acquittal of the former and the pardon of the latter. By this time he had a very large business as advocate, and was engaged on behalf of journalists in many press prosecutions. He stood forward with a noble resolution to maintain the freedom of the press, and severely censured the rigorous measures taken by the Ministry last August. In 1832, not long before the fall of Charles X., Berruyer was elected a member of the chamber of deputies. He appeared there as the champion of the king and encouraged him in his reactionary policy. After the revolution of July, when the Legitimists withdrew in a body, Berruyer alone retained his seat as deputy. He resisted, but unsuccessfully, the abolition of the hereditary peerage. He advocated trial by jury in press prosecutions, the extension of municipal franchises and other liberal measures. In May 1835 he hastened from Paris to see the duchess of Berry on her landing in the south of France for the purpose of organizing a field army in her favour. Of her son, the duke of Bordeaux, since known as the Comte de Chambord, Berruyer attempted to turn her from her purpose; and failing in this he set out for Switzerland. He was, however, arrested, imprisoned and brought to trial as one of the insurgents. He was immediately acquitted. In the following year he pleaded for the liberation of the duchess, made a memorable speech in defence of Chateaubriand, who was prosecuted for his violent attacks on the government of Louis Philippe, and undertook the defence of several Legitimist journalists. Among the most notable of these was the creator of the Fercois country, the chamber of peers, a fire-dance of Louis Napoleon after the ridiculous affair of Boulogne, in 1849, and a visit to England in December 1843, for the purpose of formally acknowledging the pretender, the duke of Bordeaux, then living in London, as Henry V. and lawful king of France. Berruyer was an active member of the National Assembly convoked after the revolution of February 1848, again visited the pretender, then at Wiesbaden, and still fought in the old cause. This long parliamentary career was closed by a courageous protest against the coup d'etat of December 2, 1851. After a lapse of twelve years, however, he appeared once more in his forsaken field as a deputy to the Corps Législatif. Berruyer was elected member of the French Academy in 1854. A visit paid by this famous orator to Lord Brougham in 1865 was made the occasion of a banquet given in his honour by the benchers of the Temple and of Lincoln's Inn. In November 1868 he was removed by his own desire from Paris to his country seat at Augerville, and there he died on the 29th of the same month.

BERESKER (from the "sark" or shirt of the "bear," or other animal-skins worn by them), in Scandinavian mythology, the name of the twelve sons of the hero Beresker, grandsons of the eight-handed Starkadder and Alfihilde. Beresker was famed for the reckless fury with which he fought, always going into battle without armour. By the daughter of King Swafurlam, whom he had killed, he had the twelve sons who were his equals in bravery. In Old Norse the term beresker thus became synonymous with reckless courage, and was later applied to the bodyguards of several of the Scandinavian heroes.

BERT, PAUL (1833-1886), French physiologist and politician, was born at Auxerre (Yonne) on the 17th of October 1833. He entered the École Polytechnique at Paris with the intention of becoming an engineer; then changing his mind, he studied law; and finally, under the influence of the zoologist, L. P. Gratiolet (1815-1865), he took up physiology, becoming one of Claude Bernard's most brilliant pupils. After graduating at Paris as doctor of medicine in 1863, and doctor of science in 1866, he was appointed professor of physiology successively at Bordeaux (1866) and the Sorbonne (1869). After the revolution of 1870 he began to take part in politics as a supporter of Gambetta. In 1874 he was elected to the Assembly, where he sat on the extreme left, and in 1876 to the chamber of deputies. He was one of the most determined enemies of clericalism, and an ardent advocate of "liberating national education from religious sects, while rendering it accessible to every citizen." In 1881 he was minister of education and worship in Gambetta's short-lived cabinet, and in the same year he created a great sensation by a lecture on modern Catholicism, delivered in a Paris theatre, in which he poured ridicule on the fables and follies of the chief religious tracts and handbooks that circulated especially in the south of France. Early in 1886 he was appointed resident-general in Tonkin and Tonkin, and died of dysentery at Hanoi on the 11th of November of that year. But he was more distinguished as a man of science than as a politician or administrator. His classical work, La Pression barométrique (1858), embodies researches that gained him the biennial prize of 20,000 francs from the Académie of Sciences in 1875, and is a comprehensive investigation on the physiological effects of air-pressure, both above and below the normal. His earliest researches, which provided him with material for his two doctoral theses, were devoted to animal grafting and the vitality of animal tissues, and they were followed by studies on the physiolo-
gical action of poisons, on anaesthetics, on respiration and asphyxia, on the causes of the change of colour in the chameleon, &c. He was also interested in vegetable physiology, and in particular investigated the movements of the sensitive plant, and the influence of light of different colours on the life of vegetation. After about 1880 he produced several elementary text-books of scientific instruction, and also various publications on educational and allied subjects.

BERTANI, AGOSTINO (1812-1886), Italian revolutionist, was born at Milan on the 19th of October 1812. He took part in the insurrection of 1831, which was ruthlessly put down by the united forces of Lombardy with Piedmont. During the Roman republic of 1849, he, as medical officer, organized the ambulance service, and, after the fall of Rome, withdrew to Genoa, where he worked with Sir James Hudson for the liberation of the political prisoners of Naples, but held aloof from the Mazzinian conspiracies. In 1859 he founded a revolutionary journal at Genoa, but, shortly afterwards, joined as surgeon the Garibaldian corps in the war of 1859. After Villafranca he became the organizer-in-chief of the expeditions to Sicily, remaining at Genoa after Garibaldi's departure for Marsala, and organizing four separate Garibaldian corps, two of which were intended for Sicily and two for the papal states. Cavour, however, obliged all to sail for Sicily. Upon the arrival of Garibaldi at Naples, Bertani was appointed secretary-general of the dictator, in which capacity he reorganized the police, abolished the secret service fund, founded twelve infant asylums, suppressed the duties upon Sicilian products, prepared for the suppression of the religious orders, and planned the sanitary reconstruction of the city. Entering parliament in 1861, he opposed the Garibaldian expedition, which ended at Apromeonte, but nevertheless went to Garibaldi's wound with affectionate devotion. In 1866 he organized the medical service for the 40,000 Garibaldians, and in 1867 fought at Mentana. His parliamentary career, though marked by zeal, was less brilliant than his revolutionary activity. Up to 1870 he remained an agitator, but, after the liberation of Rome, seceded from the historic left, and became leader of the extreme left, a position held until his death on the 30th of April 1886. His chief work as deputy was an inquiry into the sanitary conditions of the peasantry, and the preparation of the sanitary code adopted by the Crispi administration.

BERTAT (Arab. Jebelain), negroes of the Shangalla group of tribes, mainly agriculturists. They occupy the valleys of the Yabus and Tumat, tributaries of the Blue Nile. They are shortish and very black, with projecting jaws, broad noses and thick lips. By both sexes the hair is worn short or the head shaved; on cheeks and temple are tribal marks in the form of scars. The huts of the Bertat are circular, the floor raised on short poles. Their weapons are the spear, throwing-club, sword and dagger, and also the kaluba or throwing-knife. Blocks of salt are the favourite form of food, and old washing was practiced. Nature was still struggles against the spread of Mahomedanism. The Bertat, estimated to number some 80,000, c. 1885, were
nearly exterminated during the period of Dervish ascendency (1884–1898) in the eastern Sudan. Settled among them are Arab communities governed by their own sheiks, while the melks or rulers of the Bertat speak Arabic, and show traces of foreign blood. (See Fazogli.)

BERTAUT, JEAN (1552–1611), French poet, was born at Caen in 1552. He figures with Desportes in the disdainful couplet of Boileau on Ronsard:

"Ce poète orgueilleux, trêbuché de si haut,
Renouit plus reeaus Desportes et Bertaut."

He wrote a number of poems, but the most celebrated is the Imagier de court life in the manner of Desportes, but his verse is more fantastic and fuller of conceits than his master's. He early entered the church, and had a share in the conversion of Henry IV., a circumstance which assured his career. He was successively councillor of the parliament of Grenoble, secretary to the king, almoner to Marie de' Medici, abbot of Aulnay and finally, in 1666, bishop of Sées. After his elevation to the bishopric he ceased to produce the light verse in which he excelled, though his scruples did not prevent him from preparing a new edition of his œuvres de gaité (1660); in 1666. The various poems and pamphlets which he celebrated the public events of his later years are dull and lifeless. Bertaut died at Sées on the 8th of June 1611. His works were edited by M. Ad. Chenevières in 1891.

BERTH, originally a nautical term, probably connected with the verb " to bear," first found in literature at the end of the 16th century, with the alternative spelling " birth." Its primary meaning is " sea-room," whether on the high seas or at anchor. Hence the phrase " to give a wide berth to," meaning " to keep at a safe distance from," both in its literal and its metaphorical use. From meaning sea-room for a ship at anchor, " berth " comes to mean also the position of a ship at moorings (" to berth a ship"). The word further means any place on a ship allotted for a special purpose, where the men mess or sleep, or an office or appointment on board, whence the word has passed into colloquial use with the meaning of a situation or employment. From the Icelandic byrdi, a board, is also derived the ship-building term " berth," meaning to board, put up bulk-heads, etc.

BERTHELOT, MARCELIN PIERRE ÉUGÈNE (1827–1907). French chemist and politician, was born at Paris on the 29th of October 1827, being the son of a doctor. After distinguishing himself at school in history and philosophy, he turned to the study of science. In 1851 he became a member of the staff of the Collège de France as assistant to A. J. Balard, his former master, and about the same time he began his life-long friendship with Ernest Renan. In 1854 he made his reputation by his doctoral thesis, Sur les combinaisons de la glycérine avec les acides, which described a series of beautiful researches in continuation and amplification of M. E. Chevreul's classical work. In 1859 he was appointed professor of organic chemistry at the École Supérieure de Pharmacie, and in 1865 he accepted the new chair of organic chemistry, which was specially created for his benefit at the Collège de France. He became a member of the Academy of Medicine in 1863, and ten years afterwards entered the Academy of Sciences, of which he became perpetual secretary in 1889 in succession to Louis Pasteur. He was appointed inspector-general of higher education in 1876, and after his election as life senator in 1881 he continued to take an active interest in educational questions, especially as affected by compulsory military service. In the Goblet ministry of 1886–1887 he was minister of public instruction, and in the Bourgeois cabinet of 1893–1896 he held the portfolio for foreign affairs. His scientific jubilee was celebrated in Paris in 1901. He died suddenly, immediately after the death of his wife, on the 18th of March 1907, at Paris, and with her was buried in the Panthéon.

The fundamental conception that underlay all Berthelot's chemical work was that all chemical phenomena depend on the action of physical forces which can be determined and measured. When he began his active career it was generally believed that, although some instances of the synthetic production of organic substances had been observed, on the whole organic chemistry must remain an analytical science and could not become a constructive one, because the formation of the substances with which it deals required the intervention of vital activity in some shape. To this attitude he offered uncompromising opposition, and by the synthetic production of numerous hydrocarbons, natural fats, sugars and other bodies he proved that organic compounds can be formed by ordinary methods of chemical manipulation and obey the same laws as inorganic substances, thus exhibiting the " creative character in virtue of which chemistry actually realizes the abstract conceptions of its idealists. He therefore defined chemistry as " neither by the natural nor by the historical sciences." His investigations on the synthesis of organic compounds were published in numerous papers and books, including Chimie organique fondée sur la synthèse (1860) and Les Carbures d'hydrogène (1901). Again he held that chemical phenomena are not governed by any peculiar laws special to themselves, but are explicable in terms of the general laws of mechanics that are in operation throughout the universe; and this view he developed, with the aid of thousands of experiments, in his Mécanique thermique (1878) and Les origines de la chimie et de la physique (1885). His work on the development of study naturally conducted him to the investigation of explosives, and on the theoretical side led to the results published in his work Sur la force de la poudre et des matières explosives (1872), while on the practical side it enabled him to render important services to his country as president of the scientific defence committee during the siege of Paris in 1870–71 and subsequently as chief of the French explosives committee. In the later years of his life he turned to the study of the earlier phases of the science which he did so much to advance, and students of chemical history are greatly indebted to him for his book Les origines de l'alchimie and his Introduction à l'étude de la chimie des anciens et du moyen âge (1889), as well as for publishing translations of various old Greek, Syriac and Arabic treatises on alchemy and chemistry (Collection des anciens alchimistes grecs, 1887–1888, and La Chimie au moyen âge, 1893). He was also the author of Science et philosophie (1886), which contains a well-known letter to Renan on " La Science idéale et la science positive," of La Révolution chimique, Lavoisier (1890), of Science et morale (1897), and of numerous articles in Encyclopédie des sciences (1886), in which he helped to establish.

BERTHIER, LOUIS ALEXANDRE, prince of Neuchâtel (1753–1815), marshal of France and chief of the staff under Napoleon I., was born at Versailles on the 20th of February 1753. As a boy he was instructed in the military art by his father, an officer of the Corps de génie, and at the age of seventeen he entered the army, serving successively in the staff, the engineers and the prince de Lambesc's dragoons. In 1780 he went to North America with Rochambeau, and on his return, having attained the rank of colonel, he was employed in various staff posts and in a military mission to Prussia. During the Revolution as chief of staff of the Versailles national guard, he protected the sanssouci of Louis XVI. from popular violence, and aided their escape (1791). In the war of 1792 he was at once made chief of staff to Marshal Lücker, and he bore a distinguished part in the Argonne campaign of Dumouriez and Kellermann. He served with great credit in the Vendée War of 1793–95, and was in the next year made a general of division and chief of staff (Major-Général) to the army of Italy, which Bonaparte had recently been appointed to command. His power of work, accuracy and quick comprehension, combined with his marked military genius, soon made him the idol of the army, and his services were such as to make him the ideal chief of staff to a great soldier; and in this capacity he was Napoleon's most valued assistant for the rest of his career. He accompanied Napoleon throughout the brilliant campaign of 1796, and was left in charge of the army after the peace of Campo Formio. In this post he organized the Roman republic (1798), after which he joined his chief in Egypt, serving there until Napoleon's return. He assisted in the coup d'état of 18th Brumaire, afterwards becoming minister of war for
a time. In the campaign of Marengo he was the nominal head of the Army of Reserve, but the first consul accompanied the army and Berthier acted in reality, as always, as chief of which he Napoleon. At the close of the campaign he was employed in civil and diplomatic business. When Napoleon became emperor, Berthier was at once made a marshal of the empire. He took part in the campaigns of Austerlitz, Jena and Friedland, and was created duke of Valençin in 1806, sovereign prince of Neuchâtel in the same year and vice Constable of the empire in 1807. In 1808 he served in the Peninsula, and in 1809 in the Austrian War, after which he was given the title of prince of Wagram. Berthier married a niece of the king of Bavaria. He was with Napoleon in Russia in 1812. Germany in 1813, and France in 1814, fulfilling, till the fall of the empire, the functions of "major-general" of the Grande Armée. He abandoned Napoleon to make his peace with Louis XVIII in 1814, and accompanied the king in his solemn entry into Paris. During Napoleon's captivity in Elba, Berthier, whom he informed of his projects, was much perplexed as to his future course, and, being unwilling to commit himself, fell under the suspicion both of his old leader and of Louis XVIII. On Napoleon's return he withdrew to Bamberg, where he died on the 1st of June 1815. The manner of his death is uncertain; according to some accounts he was assassinated by members of a secret society, in the possession of which he trusted. According to others, being about to invade France, he threw himself from his window and was killed. Berthier was not a great commander. When he was in temporary command in 1809 the French army in Bavaria underwent a series of reverses. Whatever merit as a general he may have possessed was completely overshadowed by the genius of his master. But his title to fame is that he understood and carried out that master's directions to the minutest detail.

BERTHOLLET, CLAUDE LOUIS (1748-1822), French chemist, was born at Talloires, near Annecy in Savoy, on the 9th of December 1748. He studied first at Chambéry and afterwards at Turin, where he graduated in medicine. Settling in Paris in 1772, he became the private physician of Philip, duke of Orleans, and by his chemical work soon gained so high a reputation that in 1780 he was admitted into the Academy of Sciences. In 1785 he declared himself an adherent of the Lavoisierian school, though he did not accept Lavoisier's view of oxygen as the only and universal acidifying principle, and he took part in the reform in chemical nomenclature carried out by Lavoisier and his associates in 1787. Among the substances which Lavoisier's reformation led to the detection of, were hydrogen and prussic acid, and his experiments on chlorine, which he regarded, not as an element, but as oxygenated muriatic (oxymuriatic) acid, led him to propose it as a bleaching agent in 1785. He also prepared potassium chlorate and attempted to use it in the manufacture of gunpowder as a substitute for saltpetre. When, at the beginning of the French Revolution, the deficiency in the supply of saltpetre became a serious matter, he was placed at the head of the commission entrusted with the development of its production in French territory, and another commission on which he served had for its object the improvement of the methods of iron manufacture. He was also a member in 1794 of the committee on agriculture and the arts, and technical science was further indebted to him for a systematic exposition of the principles of dyeing—Eléments de l'art de la teinture, 1791, of which he published a second edition in 1809, in association with his son, A. B. Berthollet (1783-1811). After 1794 he was teacher of chemistry in the polytechnic and normal schools of Paris, and in 1795 he took an active part in remodelling the Academy as the Institut National. In the following year he and Gaspard Monge were chosen chiefs of a commission charged with the task of selecting in Italy the choicest specimens of ancient and modern art for the national galleries of Paris; and in 1798 he was one of the band of scientific men who accompanied Napoleon to Egypt, there forming themselves into the Institute of Egypt on the plan of the Institut National. On the fall of the Directory he was made a senator and grand officer of the Legion of Honour; under the empire he became a count; and after the restoration of the Bourbons he took his seat as a peer. In the later years of his life he had at Arcueil, where he died on the 6th of December 1822, an well-equipped laboratory, which became a centre frequented by some of the most distinguished scientific men of the time, their proceedings being published in three volumes, between 1807 and 1817, as the Mémoires de la société d'Arcueil. Berthollet's most remarkable contribution to chemistry was his Essai de statique chimique (1803), the first systematic attempt to grapple with the problems of chemical physics. His doctrines did not meet with general approval among his contemporaries, partly perhaps because he pushed them too far, as for instance in holding that two elements might combine in constant proportions, but which gave rise to a long dispute with L. J. Proust; but his speculations, in particular his insistence on the influence of the relative masses of the acting substances in chemical reactions, have exercised a dominating influence on the modern developments of the theory of chemical affinity, of which, far more than T. O. Bergman, whom he controverted, he must be regarded as the founder.

BERTHON, EDWARD LYON (1813-1899), English inventor, was born in London, on the 20th of February 1813, the son of an army contractor and descendant of an old Huguenot family. He studied for the medical profession, but on leaving school, after his marriage in 1834 he gave up his intention of becoming a doctor, and travelled for about six years on the continent. Keenly interested from boyhood in mechanical science, he made experiments in the application of the screw propeller for boats. But his model, with a two-bladed propeller, was only ridiculed when it was placed before the British admiral. Berthon therefore did not complete the patent and the idea was left for Francis Smith to bring out more successfully in 1838. In 1841 he entered Magdalen College, Cambridge, in order to study for the Church. There he produced what is usually known as "Berthon's log," in which the suction produced by the water streaming past the end of a pipe projected below a ship is registered on a mercury column above. In 1845 he was ordained, and after holding a curacy at Lympstone was given a living at Fareham. Here he was able to carry on experiments with his log, which was tested on the Southampton to Jersey steamboats; but the British admiral gave him no encouragement, and it remained uncompleted. He next designed some instruments to indicate the trim and rolling of boats at sea; but the idea for which he is chiefly remembered was that of the "Berthon Folding Boat" in 1849. After his second marriage in 1851 his name was changed to the Berthon, and he resigned his living at Fareham, and subsequently accepted the living of Romsey. In 1873, encouraged by Samuel Plimsoll, he again applied himself to perfecting his collapsible boat. Success was at last achieved, and in less than a year he had received orders from the admiralty for boats to the amount of £15,000. Some were taken by Sir George Nares to the Arctic, others were sent to General Gordon at Khartum, and others again were taken to the Zambezi by F. C. Selous. Berthon died on the 27th of October 1859.

BERTHOU, PERNARD (1727-1807), Swiss chronometer-maker, was born at Plancy, Neuchâtel, in 1727, and settling in Paris in 1745 gained a great reputation for the excellence and accuracy of his chronometers. He was a member of the Institute and a fellow of the Royal Society of London, and among other works wrote Essais sur l'horlogerie (1763). He died in 1807 at Montmorency, Seine et Oise. He was succeeded in business by his nephew, Louis Berthoud (1759-1813).

BERTILLON, LOUIS ADOLPHE (1827-1883), French statistician, was born in Paris on the 1st of April 1821. Entering the medical profession, he practised as a doctor for a number of years. After the revolution of 1830, he was appointed inspector-general of benevolent institutions. He was one of the founders of the school of anthropology of Paris, and was appointed a professor there in 1876. His Démographie figurée de la France (1874) is an able statistical study of the population of France. He died at Neuilly on the 28th of February 1883.

His son ALPHONSE BERTILLON, the anthropometrist, was born in Paris in 1853. He published in 1883 a work Ethnographie.
modernes des races sauvages, but his chief claim to distinction lies in the system invented by him for the identification of criminals, which is described by him in his Photographie judiciaire, Paris, 1800 (see Anthropometry). He was officially appointed in 1804 to report on the handwriting of the borderers in the Dreyfus case, and was a witness for the prosecution before the cour de cassation on the 18th of January 1805.

BERTIN, family of distinction in the history of French journalism. The most important member of the family, generally regarded as the father of modern French journalism, Louis François Bertin (1766–1841), known as Bertin aîné, was born in Paris on the 14th of December 1766. He began his journalistic career by writing for the Journal Français and other papers during the French Revolution. After the 18th Brumaire he founded the paper, with which the game of his family has chiefly been connected, the Journal des Débats. He was suspected of royalist tendencies by the consulate and was exiled in 1802. He returned to Paris in 1804 and resumed the management of the paper, the title of which had been changed by order of Napoleon to that of Journal de l'Empire. Bertin had to submit to a rigorous censorship, and in 1811 the conduct, together with the profits, was taken over entirely by the government. In 1814 he regained possession and restored the old title and continued his support of the royalist cause—during the Hundred Days; he directed the Moniteur de Gand—till 1823, when the Journal des Débats became the recognized organ of the constitutional opposition. Bertin's support was, however, given to the July monarchy after 1830. He died on the 15th of September 1841. Louis François Bertin jun., also a prominent journalist (1814–1842), was a brother of Bertin aîné; took a leading part in the conduct of the Journal des Débats, to the success of which his powers of writing greatly contributed. He entered the chamber of deputies in 1815, was made councillor of state in 1827, and a peer of France in 1830. The two sons of Bertin aîné, Edouard François (1797–1871) and Louis Marie François (1801–1854), were directors in succession of the Journal des Débats. Edouard Bertin was also a painter of some distinction.

BERTINORO, OBADIAH, Jewish commentator of the Mishnah, died in Jerusalem about 1500. Bertinoro much improved the status of the Jews in the Holy Land; before his migration thither the Jews of Palestine were in a miserable condition of poverty and persecution. His commentary on the Mishnah is the most useful of all helps to the understanding of that work. It is printed in most Hebrew editions of the Mishnah. Surenhusius, in his Latin edition of the last-named code (Amsterdam 1608–1703), translated Bertinoro's commentary.

BERTINORO, a town and episcopal see of Emilia, Italy, in the province of Forli, 8 m. S.E. direct of Forli and 33 m. N. of the station of Forlimpopoli, and 800 ft. above sea-level. Pop. (1901), town, 17,755; commune, 35,121. The town commands a fine view to the north over the plain of Emilia and the lower course of the Po, itself lying on the foothills of the Apennines. It appears to have been first fortified by Frederick Barbarossa, and its castle stood frequent sieges in the middle ages. Polenta, 23 m. to the south of it, was the birthplace of Francesca da Rimini. The castle is almost entirely ruined, but the church of S. Donato, of the Lombard period, with Byzantine capitals, is interesting; Giosefo Carducci has written a fine ode on the subject (La Chiesa di Polenta, Bologna, 1897).

See C. Ricci, "Della Chiesa e castello di Polenta" in Atti e Memorie della Deputazione di Storia patria per le province di Romagna, ser. ii. vol. ix. (Bologna, 1891), 1 seq.

BERTOLD (1442–1504), elector and archbishop of Mainz, son of George, count of Henneberg, entered the ecclesiastical profession, and after passing through its lower stages, was made archbishop of Mainz in 1484. He appears to have been a firm supporter of law and order, an enemy of clerical abuses and a careful administrator of his diocese. Immediately after his election as archbishop he began to take a leading part in the business of the Empire, and in 1486 was very active in securing the election of Maximilian as Roman king. His chief work, however, was done as an advocate of administrative reform in Germany. During the reign of the emperor Frederick III. he brought this question before the diet, and after Frederick's death, when he had become imperial chancellor, he was the leader of the party which pressed the necessity for reform upon Maximilian at the diet of Worms in 1495. His proposals came to nothing, but he continued the struggle at a series of diets, and urged the Germans to emulate the courage and union of the Swiss cantons. He gained a temporary victory when the diet of Augsburg in 1500 removed a council of regency (Richterregenten) and in 1500 persuaded the electors to form a union to uphold the reforms of 1495 and 1500. The elector died on the 21st of December 1504. Bertold was a man of great ability and resourcefulness, and as a statesman who strove for an ordered and united Germany was far in advance of his age.

See J. Weiss, Berthold von Henneberg, Erzbischof von Mainz (Freiburg, 1889).

BERTOLD VON REGensburg (c. 1220–1272), the greatest German preacher of the later middle ages, was a native of Regensburg, and entered the Franciscan monastery there. From about 1250 onwards his fame as a preacher spread over all the German-speaking parts of the continent of Europe. He wandered from village to village and town to town, preaching to enormous audiences, always in the open air; the earnestness and straightforward eloquence with which he insisted that true repentance came from the heart, that pious pilgrimages and exterior ablation of the Church were mere outward symbols, appealed to all classes. He died in Regensburg on the 13th of December 1272. His German sermons, of which seventy-one have been preserved, are among the most powerful in the language, and form the chief monuments of Middle High German prose. His style is clear, direct and remarkably free from curious Latin constructions; he employed, whenever he could, the pithy and homely sayings of the peasants, and is not reluctant to point his moral with a rough humour. As a thinker, he shows little sympathy with that strain of medieval mysticism which is to be observed in all the maturity of his thought and speech.

BERTRAM, CHARLES (1723–1765), English literary impostor, was born in London, the son of a silk dyer. In 1747, being then teacher of English at the school for Danish naval cadets at Copenhagen, he wrote to Dr William Stukeley, the English antiquarian, that he had discovered a manuscript written by a monk named Richard of Westminster, which corrected, and supplemented the chronicles of the earlier historians of the Middle Ages. He courteously sent to Stukeley a copy of various parts of the work and a facsimile of a few lines of the manuscript. These were so cleverly executed that they quite deceived the English palaeographers of the period. Stukeley, finding that a chronicle of the fourteenth century, Richard of Cirencester, had also been an inmate of Westminster Abbey, identified him with Bertram's Richard of Westminster, and, in 1756, read an analysis of the "discovery" before the Society of Antiquaries, which was published with a copy of Richard's map. In 1757 Bertram published at Copenhagen a volume entitled Bertram's Monumental Antiqua or Scriptores Tres. This contained the works of Gildas and Nennius and the full text of Bertram's forgery, and though Bertram's map did not correspond with that of Richard, Stukeley discarded the latter and adopted Bertram's contribution in his Itinerarium Curiosum published in 1776. Although Thomas Reynolds in his Iter Britanniarum (1799), an edition of the British portion of Antoninus' Itinerary, was distinctly sceptical as to the value of Bertram's manuscript, its authenticity was generally accepted until the middle of the 19th century. No original of the manuscript could then be found at Copenhagen, and B. B. Woodward, librarian of Windsor Castle, proved conclusively, by a series of articles in the Gentleman's Magazine in 1866 and 1867, that
BERTRAND—BERWICK

the supposed facsimile of calligraphy produced by Bertram was a blend of the style of various periods, while the greater portion of the idiomatic Latin in the book was a mere translation of 18th century English phraseology. Nevertheless, as late as 1872, a translation of Bertram's forgery was included in Bohn's Antiquarian Library as one of the Six English Chronicles, and there is no doubt that the work had a wide and misleading influence upon many antiquarian writers. Bertram died in 1795.

BERTRAND, HENRI GRATIEN, COMTE (1773–1844), French general, was born at Châteauroux. At the outbreak of the Revolution, he had just finished his studies, and he entered the army as a volunteer. During the expedition to Egypt, Napoleon named him colonel (1798), then brigadier-general, and after Austerlitz his aide-de-camp. His life was henceforth closely bound up with that of Napoleon, who had the fullest confidence in him, honouring him in 1813 with the title of grand marshal of the court. It was Bertrand who in 1806 directed the building of the bridges by which the French army crossed the Danube at Regron. In 1813, after the battle of Leipzig, it was due to his initiative that the French army was not totally destroyed. He accompanied Napoleon to Elba in 1814, returned with him in 1815, held a command in the Waterloo campaign, and then, after the defeat, accompanied Napoleon to St Helena. He did not return to France until after Napoleon's death, and then Louis XVIII. allowed him to retain his rank, and he was elected deputy in 1830. In 1840 he was chosen to go to bring Napoleon's remains to France. He died at Châteauroux on the 31st of January 1844. His touching fidelity has made his name very popular in France.

BERTRICH, a village and watering place of Germany, in the Prussian Rhine province, in a narrow valley running down to the Mosel near Cochem. Its waters are efficacious in cases of gout, rheumatism and biliary affections. Pop. 500.

BÉRULLE, PIERRE DE (1575–1629), French cardinal and statesman, was born at Sérrilly, near Troyes, on the 4th of February 1575. He was educated by the Jesuits and at the university of Paris. Soon after his ordination in 1590, he assisted Cardinal Duperron in his controversy with the Protestant Philippe de Mornay, and made numerous converts. He founded the Congregation of the French Oratory in 1611 and introduced the Carmelite nuns into France, notwithstanding the opposition of the friars of that order, who were jealous of his ascendancy. Bérulle also played an important part as a statesman. He obtained the necessary dispensations from Rome for Henrietta Maria's marriage to Charles I., and acted as her chaplain during the first year of her stay in England. In 1623, as French ambassador to Spain, he concluded the treaty of Monzon. After the reconciliation of Louis XIII. with his mother, Marie de' Medici, through his agency, he was appointed a councillor of state, but had to resign this office, owing to his Austrian policy, which was opposed by Richelieu. Bérulle encouraged Descartes' philosophical studies, and it was through him that the Samaritan Pentateuch, recently brought over from Constantinople, was inserted in Lejay's Polyglot Bible. His treatise, Des Grandeurs de Jésus, was a favourite book with the Jansenists. He died on the 2nd of October 1629. His works, edited by P. Bourgoing (2 vols., 1644) were reprinted, by Migne in 1857.

See M. de Bérulle et les Carmélites; Le Père de Bérulle et l'oratoire de Jésus; Le Cardinal de Bérulle et Richelieu (3 vols., 1872–1876), by the Abbot M. Houssaye; and H. Séjély, L'œuvre de Bérulle et du Clerc in France in the Seventeenth Century (London, 1875).

BERVIE, or INVERBERVIE, a royal and police burgh of Kin- cardineshire, Scotland. Pop. (1901) 1207. It is situated at the mouth of Bervie Water and is the terminus of the North British railway's branch line from Montrose, which lies 14 m. S.W. The leading industries include manufactures of woollens, flax and chemicals, and there is also a brisk trade in live-stock. Bervie unites with Arbroath, Brechin, Forfar and Montrose in returning one member (for the "Montrose burghs") to parliament. David II., driven by stress of weather, landed here with his queen Joanna in 1344, and, out of gratitude for the hospitality of the townsfolk, granted them a charter, which James VI. confirmed. Hallgreen Castle, a stronghold of the 14th century, is maintained in repair. About one m. south is the fishing village of Gourdon (pop. 1157), where boat-building is carried on. There is a small but steady export business from the harbour, which has a pier and breakwater. St Ternan's, the Romanesque parish church of Arbuthnot, 2 1/2 m. north-west, stands on the banks of the Bervie. In the chapel dedicated to St Mary, which was afterwards added to it, is the burial-place of the Arbuthnots, who took their title from the estate in 1644. John Arbuthnot, Queen Anne's physician and the friend of Swift and Pope, was a native of the parish. Kinnell, 2 m. north, on the coast, is of interest as the place where the Scottish regalia were concealed during the siege of Dunottar Castle.

BERWICK, JAMES FITZJAMES, DUKE OF (1670–1734), marshal of France, was the natural son of James, duke of York, afterwards James II. of England, by Arabella Churchill (1648–1730), sister of the great duke of Marlborough. He was born at Moulins (Bourbonnais) on the 21st of August 1670. He received his education in France at the hands of the Jesuits, and at the age of fifteen, his father having succeeded to the throne, he was sent to learn the business of a soldier under the famous general of the empire, Charles of Lorraine. He served his first campaign in Hungary, and was present at the siege of Buda. He then returned to England, was made a colonel of the 8th Foot, and in 1687 created duke of Berwick, earl of Teignmouth and Baron Bosworth. He then went out fresh to Hungary and was present at the battle of Mohacz. On his return to England he was made K.G., colonel of the 3rd troop of horse under General Harley (afterwards horse-general and lord mayor of London), but soon afterwards the revolution forced him to flee to France. He served under James II. in the campaign in Ireland, and was present at the battle of the Boyne. For a short time he was left in Ireland as commander-in-chief, but his youth and inexperience unfitness him for the post, and he was a mere puppet in stronger hands. He then took service in the French army, fought under Marshal Luxembourg in Flanders, and took part in the battles of Steinkirk and Neerwinden, at the latter of which he was taken prisoner. He was, however, immediately exchanged for the duke of Ormond, and afterwards he served under Villeroi. In 1695 he married the widow of Patrick Sarsfield, who died in 1698. His second marriage, with Anne Bulkley, took place in 1700. As a lieutenant-general he served in the campaign of 1702, after which he became naturalized as a French subject in order to be eligible for the marshallate. In 1704, he first took command of the French army in Spain. So highly was he now esteemed for his courage, abilities and integrity, that all parties were anxious to have him on their side (Éloge, by Montesquieu). His tenure of the command was, however, very short, and after onecampaign he was replaced by the Marshal de Tassé. In 1705 he commanded against the Camisards in Languedoc, and when on this expedition he is said to have carried out his orders with remorseless rigour. His successful expedition against Nice in 1706 caused him to be made marshal of France, and in the same year he returned to Spain as commander-in-chief of the Franco-Spanish armies. On the 25th of April 1707, the duke won the great and decisive victory of Almanza, where an Englishman at the head of a French army defeated Ruvigny, earl of Galway, a Frenchman at the head of an English army. The victory established Philip V. on the throne of Spain. Berwick was made marquis of France by Louis XIV., and duke of Liria and of Xereca and lieutenant of Aragon by Philip. Thenceforward Berwick was recognized as one of the greatest generals of his time, and successively commanded in nearly all the theatres of war. From 1709 to 1712 he defended the south-east frontier of France in a series of campaigns which, unmarked by any decisive battle, were yet models of the art of war as practised at the time. The last great event of the War of the Spanish Succession was the storming of Barcelona by Berwick, after a long siege, on the 12th of September 1714. Three years later he was appointed military governor of the province of Guienne, in which post he became intimate with
Montesquieu. In 1718 he found himself under the necessity of once more entering Spain with an army; and this time he had to fight against Philip V., the king who owed chiefly to Berwick's courage and skill the safety of his throne. One of the marshal's sons, known as the duke of Liria, was settled in Spain, and was counselled by his father not to shrink from doing his duty and fighting for his sovereign. Many years of national campaigns followed, and Marshal Berwick was again called to serve in the field till 1733. He advised and conducted the siege of Philipburg, and while the siege was going on was killed by a cannon-shot on the 12th of June 1734. Cool, self-possessed and cautious as a general, Marshal Berwick was at the same time not wanting in audacity and swiftness of action. He was a true general of the 18th century, not less in his care for the lives of his men than in his punctiliousness and rigidity in matters of discipline.

The Mémoires of Marshal Berwick, revised, annotated and continued by the Abbé Hooke, were published by the marshal's grandson in 1778. Montesquieu made many contributions to this.

BERWICKSHIRE, a county of Scotland, forming its southeastern extremity, bounded N. by Haddingtonshire and the North Sea; E. by the North Sea; S.E. by the county of the borough and town of Berwick; S. by the Tweed and Roxburghshire, and W. by Mid-Lothian. Its area is 292,577 acres or 457 sq. m., and it has a coast-line of 21 m. The county is naturally divided into three districts: Lauderdale or the valley of the Leader, in the W.; Lammermuir, the upland district occupied by the hills of that name in the N.; and the Merse (the March or Borderland, giving a title to the ears of Wemyss), the largest district, occupying the S.E. The Lammermuirs are a range of round-backed hills, whose average height is about 1000 ft., while the highest summit, Says Law, reaches 1749 ft. From these hills the Merse stretches to the S. and E., and is a comparatively level tract of country. The coast is lofty, rocky and precipitous, broken by ravines and not accessible, except at Eyemouth Harbour, for small vessels, and at Coldingham and Burnmouth for fishing boats. St Abb's Head, a promontory with a lighthouse upon it, rises to 310 ft. The Eye is the only river of any size which falls directly into the sea. The others—the Leader, the Eden, the Leet and the Whiteadder with its tributaries, the Blackadder and the Dye—all flow into the Tweed. Of these the largest and most important is the Whiteadder, which has its source in the parish of Whittingehame on the East Lothian side of the Lammermuirs, and, following a sinuous course of 35 m., joins the Tweed within the bounds or liberties of Berwick. There are small lochs at Coldingham, Legerwood, Spottiswoode, the Hirsel, near Coldstream, Hule Moss on Greenlaw Moor, and tiny sheets of water near Duns and Legerwood.

Geology.—The north portion of the county embraces that part of the Silurian tableland of the south of Scotland which stretches from the Lammermuir Hills east to St Abb's Head. The strata consist mainly of grits, greywackes, flags and shales, repeated in innumerable folds, trending north-east and south-west, which are laid bare in the great cliff section between Fast Castle and St Abb's Head. This section of the tableland includes sediments, chiefly of Tarannan age, which form a belt 10 m. across from the crest of the Lammermuir Hills to a point near Westruther and Longformacus. In the Tarannan, the Black Burn and the Gauntlet of Llandover, Cardac and Llandeilo rocks, together with the Arenig cherts, appear along an anticlinal fold in the midst of the younger strata. Again in the extreme north-west of the county near Channelkirk and to the north of the Tarannan belt radiolarian cherts and black shales with grypotilites of Upper Llandeilo and Cardac age are met with. The Lower Old Red Sandstone rocks, which rest unconformably on the folded and denuded Silurian strata, appear at Eyemouth and Reston Junction, and at St Abb's Head are associated with contemporaneous volcanic rocks which are evidently on the same horizon as the interbedded lavas of Lower Old Red age in the Chirnside. The intrusive igneous materials of this period are represented by the granitic mass of Cockburn Law and the porphyrites of the Dirrington Laws. The Upper Old Red Sandstone, consisting of conglomerates and sandstones, rest unconformably alike on the Silurian platform as at Siccarr Point and on the lower division of that system. The age of these beds has been determined by the occurrence of remains of Holoptilites nobilissimus in the sandstones at Earlston and in the Whiteadder north of Duns. On the Black Hill of Earlston these strata are traversed by a sheet of trachyte resembling the type of rock cropping the Eldon Hills (see Roxburghshire). Also on the D版

Overying the strata just described there is a succession of volcanic rocks extending from Greenlaw southwards by Stichil and Kelso to Carham, which, at several localities, are followed by a band of cornstone resembling that near the top of the Upper Old Red Sandstone in the midland valley of Scotland. Next in order comes a great development of the Cementstone group of the Carboniferous system which spreads over nearly the whole of the low ground of the Merse and attains a great thickness. At Marshall Meadows north of Berwick-on-Tweed, thin bands of marine limestone occur, which probably represent some of the calcareous beds above the Fell sandstones south of Spittal.

Climate and Agriculture.—Owing to the maritime position, the winter is seldom severe in the lowland districts, but spring is a trying season on account of the east winds, which often last into summer. The mean annual rainfall is 30½ in. and the average temperature for the year is 47°F., for January 37°F., and for July 58°F. The climate is excellent as regards both the health of the inhabitants and the growth of vegetation. The Tweed and its tributaries are sometimes taken on the same farm. Along the rivers is a deep rich loam, resting on gravel or clay, chiefly the former. The less valuable clay soil of the Merse has been much improved by drainage. The more sandy and gravelly soils are suitable for turnips, of which great quantities are grown. Oats and barley are the principal grain crops, but wheat also is raised. The flocks of sheep are heavy, and cattle are pastured in considerable numbers. Large holdings predominate—indeed, the average size is the highest in Scotland—and scientific farming is the rule. The labourers, who are physically well developed, are as a whole frugal, industrious and intelligent, but somewhat migratory in their habits. This feature in their character, which they may have by inheritance as Borderers, has admirably fitted them for colonial life, to which the scarcity of industrial occupation has largely driven the surplus population.

Other Industries.—Next to agriculture the fisheries are the most important industry. The Tweed salmon fisheries are famous, and the lesser rivers of the Merse are held in high esteem by anglers. Eyemouth, Burnmouth, Coldingham and Cove are engaged in the sea fisheries. Cod, haddock, herring, ling, lobsters and crabs are principally taken. The season for herring is from May to the middle of September and for white fish from October to the end of May. Coal, copper ore and ironstone exist in too small quantities to work, and the limestone is so far from a coal district as to be of little economic value. Earlston sends out gingham and woollen cloths. At Camleagh on the Whiteadder, blankets and plaids are manufactured, and paper is made at Chirnside. The other manufactures are all connected with agriculture, such as distilleries, breweries, tanneries, &c. The trade is also mainly agricultural. Fairs are held at Duns, Lauder, Coldstream and the Greenlaw. The chief of these are mostly take place at the auction marts at Reston, Duns and Earlston. There are grain markets at Duns and Earlston. Berwick, from which the county derives its name, is still its chief market. There is, however, no legal or fiscal connexion between the county and the borough.

The North British railway monopolizes the communications of the county. The system serves the coast districts from Berwick to Cockburnspath, and there is a branch from Reston to St Boswells.

Population and Government.—The population of Berwickshire was 3,200 in 1801 and 2,824 in 1901, in which year the number of persons speaking Gaelic and English was 74, and one person spoke Gaelic only. The only considerable towns are Eyemouth (pop. in 1901. 2,436) and Duns (2,206). The county returns one
member to parliament. Lauder is the only royal burgh, and Duns the county town, a status, however, which was held by Greenlaw from 1666 to 1832, after which date it was shared by both towns until conferred on Duns alone. Berwickshire forms a sheriffdom with Roxburgh and Selkirk shires, and there is a resident sheriff-substitute at Duns, who sits also at Greenlaw, Coldstream, Ayton and Lauder. In addition to board and voluntary schools throughout the county, there is a high school, which is also a technical school, at Duns, and Coldstream and Lauder public schools have secondary departments. The schools are utilized by the county council, which pays the expenses of students attending it from a distance.

History.—Traces of Roman occupation and of ancient British settlement exist in various parts of the Merse. Edwin or Etién's Hall, on Cockburn Law, 4 m. north of Duns, is still called the Pech's or Pict's House, and is one of the very few brochs found in the Lowlands. After the Romans withdrew (409) the country formed part of the Saxon kingdom of Northumbria, and the inhabitants were converted to Christianity through the missionary efforts of Modan in the 6th, and Oswald in the 7th century (though no bones have to be born in the vale of the Leader) in the 7th centuries. The Northmen invaded the seaboard, but the rugged coast proved an effectual barrier. The Danes, however, landed in 886, and destroyed the nunnery at Coldingham, founded about 650 by Ebba, daughter of Æthelfrith, king of Northumbria, after whom the adjoining promontory of St Abb's Head was named. After the battle of Carham (1018) the district, which then constituted part of the division of Lothian, was annexed to Scotland. Birgham (pron. Birjam), 33 m. west of Coldstream, was the scene of an interview in 1188 between William the Lion and the bishop of Durham, which discussed the attempt of the English church to assert supremacy over the Scottish. Here also met in 1280 a convention of the Scots estates to consider the projected marriage of Prince Edward of England to the Maid of Norway; and here was signed in 1290 the treaty of Birgham, assuring the independence of Scotland. During the long period of international strife the shire was repeatedly overrun by armies of the English and Scots kings, who were constantly fighting for the ancient frontier town of Berwick. It was finally ceded to England in 1482, and the people afterwards gradually settled down to peaceful pursuits. The town at the confluence of the Leet and Tweed near Coldstream gave access to south-eastern Scotland. Edward I. crossed it with his army in 1296, encamping at Hutton the day before the siege of Berwick, and it was similarly employed as late as 1640, when the marquess of Montrose led the Covenanters on their march to Newcastle, although James VI. had already caused a bridge to be constructed from Berwick to Tweedmouth. There are several places of historic interest in the county. Upon the site of the nunnery at Coldingham King Edgar in 998 founded a Benedictine priory, which was one of the oldest monastic institutions in Scotland and grew so wealthy that James III. annexed its revenues to defray his extravagance, a step that precipitated the revolt of the nobles (1488). The priory was seriously damaged in the earl of Hertford's inroad in 1545, and Cromwell blew up part of the church in 1650. The chancel (without aisles) was repaired and used as the parish church. The remains contain some fine architectural features, such as, on the outside, the Romanesque arcades surmounted by lancet windows at the east end, and, in the interior, the Early Pointed triforium. On the coast, about 4 m. north-west of Coldingham, are the ruins of Fast Castle—the "Wolf's Crag" of Scott's "Bridge of Lammermoo"—situated on a precipitous headland. From Sir Patrick Hume it passed to Sir Robert Logan of Restalrig, who is alleged to have been one of the Gowrie conspirators, and to have intended to imprison James VI. within its walls (1600). The four miles west is the Pease or Peaths bridge, built by Thomas Telford in 1786 across the deep pass which was of old one of the strongest natural defences of Scotland. The bridge is 123 ft. high, 300 ft. long and 16 ft. wide. Near it are the ruins of Cockburnspath Tower, once a strong fortress and supposed to be the "Ravenswood" of the "Bridge of Lammermoo." In the south-west of the shire besides Dryburgh Abbey (q.v.) there are, at Earlston, the remains of the castle that was traditionally the residence of Thomas the Rhymer. Hume Castle, the ancient seat of the Home family, a picturesque ruin about 3 m. south of Greenlaw, is so conspicuously situated as to be visible from nearly every part of the county. Coldstream and Lamberton, being close to the Border, were both resorted to (like Greenlaw in the west) by eloping couples for clandestine marriage. In Lamberton church was signed in 1505 the marriage of Margaret Tudor, which led, a century later, to the union of the crowns of Scotland and England.

Robson, The Churches and Churchyards of Berwickshire (Kelso, 1889); F. H. Gromoll, Border Churches of the Scottish Taint, Two Centuries of Border Church Life (Kelso, 1889); Margaret Warrender, Marchment and the Humes of Polworth (Edinburgh, 1894); W. K. Hunter, History of the Priory of Coldingham (Edinburgh, 1858).

BERWICK-UPON-TWEED, a market town, seaport, municipal borough and county in itself, of England, at the mouth of the Tweed on the north bank, 339 m. N. by W. from London. Pop. (1901) 13,437. For parliamentary purposes it is in the Berwick-upon-Tweed division of Northumberland. It is the junction on the East Coast route from London to Scotland between the North Eastern and North British railways, a branch of the company first named running up the Tweed valley by Coldstream and Kelso. The town lies in a bare district on the slope and flat summit of an abrupt elevation, higher ground rising to the north and south across the river. It has the rare feature of a complete series of ramparts and moats. These on the north and west are formed of earth faced with stone, with bastions at intervals and a ditch now dry. They are of Elizabethan date, but there are also lines of much earlier date, the fortifications of Edward I. Much of these last has been destroyed, and threatened encroachment upon the remaining relics so far aroused public feeling that in 1905 it was decided that the Board of Works should take over these ruins, including the Bell Tower, from the town council, and enclose them as national relics. The Bell Tower, from which alarms were given when border raiders were observed, is in fair preservation. There are slight remains of the castle, which fell into disrepair after the union of the crowns of England and Scotland. There are no traces of the churches, monasteries or other principal buildings of the ancient town. The church of Holy Trinity is a plain building without steeple, of the time of Cromwell. Of modern places of worship, the most noteworthy is Wallace Green United Presbyterian church (1853). The chief public building is the town hall (1760), a stately classic building surmounted by a lofty spire. Educational institutions include an Elizabethan grammar school and a blue-coat school; and there is a local museum. Two bridges connect the town with the south side of the Tweed. The older, which is very substantial, was finished in 1634, having taken twenty-four years in building. It has fifteen arches, and is 924 ft. long, but only 17 ft. wide. A unique provision for its upkeep out of Imperial funds dates from the reign of Charles II. The other, the Royal Border Bridge, situated a quarter of a mile up the river, is a magnificent railway viaduct, 126 ft. high, with twenty-eight arches, which extends from the railway station, a castellated building on part of the site of the old castle, to a considerable distance beyond the river. This bridge was designed by Robert Stephenson and opened by Queen Victoria in 1850.

The reach of the river from the old bridge to the mouth forms the harbour. The entrance to the harbour is protected by a stone pier, which stretches half a mile south-east from the north bank of the river mouth. The depth of water at the bar is 17 ft. at ordinary tides, 22 ft. at spring tides, but the channel is narrow, a large rocky portion of the harbour on the north side being dry at low water. There is a wet dock of 3½ acres. Principal exports are grain, coal and fish; imports are bones and bone-ash, manure stuffs, linseed, salt, timber and iron. The herring and other sea fisheries are of some value, and the salmon fishery, in the hands of a company, has long been famous. A fair is held
annually at the end of May. There are iron-works and boat-building yards.

The custom of specially mentioning Berwick-upon-Tweed after Wales, though abandoned in acts of parliament, is retained in certain proclamations. The title of "county in itself" also helps to recall its ancient history. The liberties of the borough, commonly called Berwick Bounds, include the towns of Spittal, at the mouth, and Tweedmouth immediately above it, on the south side of the river. These are mentioned in a chartulary (pop. 1874), with pleasant sands and a chalybeate spa; the second (pop. 3086) has iron foundries, engineering works and fish-curing establishments. Berwick-upon-Tweed is governed by a mayor, 6 aldermen and 18 councillors. Area, 6396 acres.

Very little is known of the history of Berwick before the Conquest. It was not until the Tweed became the boundary between England and Scotland that Berwick was the chief town on that boundary became really important. Until the beginning of the 14th century Berwick was one of the four royal boroughs of Scotland, and although it possesses no charter granted before that time, an inquisition taken in Edward III.'s reign at Berwick as the chief town on that boundary was really important. Until the beginning of the 14th century Berwick was one of the four royal boroughs of Scotland, and although it possesses no charter granted before that time, an inquisition taken in Edward III.'s reign at Berwick as the chief town on that boundary was really important.

The burgesses were given the right to elect another mayor with the commonalty and four bailiffs. They also had to own freedom from toll, pontage, &c., two markets every week on Monday and Friday, and a fair lasting from the feast of Holyrood to that of the Nativity of St John the Baptist, in 1307 continued under another charter, granting them the right to the time of Alexander III., for a fee-farm rent of 500 marks, which was granted back to them in 1313 to help toward enclosing their town with a wall. While the war with Scotland dragged on through the early years of the reign of Edward II., the fortification of Berwick was a matter of importance, and in 1317 the men of the town took to the sea with the yearly sum of 6000 marks; but in the following year, "owing to their default," the Scots entered and occupied it in spite of a truce between the two kingdoms. After Edward III. had recovered the inhabitants permitted the borough to call the town the King's Bell-tower, the symbol of their independence, which their predecessors had before the time of Alexander III., and which had been granted to William de Keytheper when Edward I. took the town. Edward III. in 1346 and 1359 confirmed the charter of Edward I. and in 1357, evidently to encourage the growth of the borough, granted that all who were willing to reside there and deemed of the burgesses should be admitted on payment of a fine. These early charters were confirmed by most of the succeeding kings, until James I. granted the incorporation charter in 1604; but on his accession to the English throne, Berwick of course suffered the same fate as a borough at first represented in the court of the four boroughs and in 1326 in Robert Bruce's parliament. After being taken by the English it remained unrepresented until it was re-taken by the Scots, when it sent two members to parliament at first and afterwards one. In 1565 the burgesses were allowed to send two members to the English parliament, and were represented there until 1885, when the town was included in the Berwick-upon-Tweed division of the county of Northumberland. No manufactures are mentioned as having been carried on in Berwick, but its trade, chiefly in the produce of the surrounding country, was important in the 12th century. It has been noted for salmon fishery in the Tweed from very early times. There was a bridge over the Tweed at Berwick in the time of Alexander and John, kings of Scotland, but it was broken down in the time of the latter and not rebuilt until the end of the 14th century.

See Victoria County History, Northumberland; John Fuller, History of Berwick-upon-Tweed, &c. (1796); John Scott, Berwick-upon-Tweed; History of the Town and Guild (1888).

**BERYL**—BERYLLIUM

Berrie, a mineral containing beryllium and aluminium in the form of a silicate; its formula is Be₂Al₂Si₂O₈. The species includes the emerald (g.s.), the aquamarine (g.s.) and other transparent varieties known as "precious beryl," with certain coarse varieties unfit for use as gem-stones. The name comes from the Gr. βερυλλος, a word of uncertain etymology applied to the beryl and probably several other gems. It is notable that the relation of the emerald to the beryl, though proved only by chemical analysis, was conjectured at least as far back as the time of Pliny.

Beryl crystallizes in the hexagonal system, usually taking the form of long-sided prisms, striated vertically and terminated with the basal plane, sometimes associated with various pyramidal faces (fig.). It cleaves rather imperfectly parallel to the base. The colour of beryl may be blue, green, yellow, brown or rarely pink; while in some cases the mineral is colourless. The specific gravity is about 2.7, and the hardness 7.5 to 8, so that for a gem-stone beryl is comparatively soft. Whilst the gem-varieties are transparent, the coarse beryl may be opaque. The transparent crystals are pleochroic—a character well marked in emerald.

Beryl was much prized as a gem-stone by the ancients, and Greek intaglios of very fine workmanship are extant. The Roman jewelers, taking advantage of the columnar form of the natural crystal, worked it into long cylinders for ear-pendants. It was a favourite stone with the artists of the Renaissance, but in modern times is less popular except in the form of the emerald, which remains one of the most valued gem-stones.

It is notable that English lapidaries of the 18th century often included the sard under the term beryl—a practice which has led to some confusion in the nomenclature of engraved gems.

Beryl occurs as an accessory constituent of many granitic rocks, especially in veins of pegmatite, whilst it is found also in greiss and in mica-schist. Rolled pebbles of beryl occur, with topaz, in Brazil, especially in the province of Minas Geraes. Crystals are found in drusy cavities in granite in the Urals, notably in the province of Sverdlovsk. Many of these crystals are pale yellow and long prismatic crystals; and in the mining district of Nerchinsk in Siberia, principally in the Adun-Chalon range, where beryl occurs in veins of topaz-rock piercing granite. Among European localities may be mentioned Elba, good crystals being occasionally found in the tourmaline-granite of San Piero. In Ireland excellent crystals of beryl occur in druses of the granite of the Mourne Mountains in Co. Down, and others less fine are found in the highlands of Donegal, whilst the mineral is also known from the Leinster granite. It occurs likewise in the granite of the Grampians in Scotland, and is not unknown in Ireland. Beryl is formed in the hot, dry, arid climate of the desert country, adjacent to the foot of the Andes. It is very numerous in the granites of the western United States, and is the chief source of the world's supply.

Many localities in the United States yield beryl, sometimes sufficiently fine to be cut as a gem. It is found, for example, at Hiddenite and elsewhere in Alexander county, N.C.; at Haddam and Monroe, Conn.; at Stoneham and at Albany, in Oxford county, Maine; at Royalton, Mass.; and at Mt. Antero, Colorado, where it occurs with phencite. Beryl of beautiful pink colour occurs in San Diego county, California. Coarse beryl, much riddled, is found in crystals of very large size in the Near East, and along the Mediterranean. A crystal from Ayrton weighing more than 2½ tons. A colourless beryl from Goshen, Mass., has been called Goshenite; whilst crystals of coarse yellow beryl from Rubislaw quarry in Aberdeenshire, Scotland, have been termed Davidsonte.

Beryl suffers alteration by weathering, and may thus pass into kaolin and mica.

(B. W. R.)

**BERYLLIUM**, or **GELICINUM** (symbol Be, atomic weight 9.1), one of the metallic chemical elements, included in the same sub-group of the periodic classification as magnesium. It was first obtained, in an impure condition, in 1828 by A. A. Bussy (1794-1882) and F. Wohler by the reduction of the chloride with potassium, and in 1853 H. J. Debray prepared it, in a compact state, by reducing the volatilized chloride with melted sodium, in an atmosphere of hydrogen. L. F. Nilson and O. Pettersson (Wied. Ann. 1878, iv. p. 549) have also prepared the metal by heating beryllium potassium fluoride with sodium; P. M. Lothaire (Comptes rendus, 1895-1685, vol. 108, p. 127); has obtained it in lustrous hexagonal crystals by electrolyzing the double fluoride of beryllium and sodium or potassium with an excess of
BERYLLONITE—BERZELIUS

beryllium fluoride. It is a malleable metal, of specific gravity 1.64 (Nilson and Pettersson) and a specific heat of 0.4979. Its melting-point is below that of silver. In a fine state of division it takes fire on heating in air, but is permanent at ordinary temperatures in oxygen or air; it is readily attacked by hydrochloric and sulphuric acids, but is not attacked by dilute solutions of the caustic alkalis, with evolution of hydrogen a behaviour similar to that shown by aluminium. It combines readily with fluorine, chlorine and bromine, and also with sulphur, selenium, phosphorus, &c.

Considerable discussion has taken place at different times as to the position which beryllium should occupy in the periodic classification of the elements, and as to whether its atomic weight should be 9.1 or 13.65, but the weight of evidence undoubtly favours its position in Group II, with an atomic weight 9.1 (18) (see Nilson and Pettersson, Berichte, 1880, 13, p. 1451; 1884, 17, p. 987; B. Brauner, Berichte, 1888, 44, p. 113; C. H. Carneley, Journal of Chem. Soc., 1879, xxvi. p. 562; 1880, xxxvii., p. 125, and W. N. Hartley, Journal of Chem. Soc., 1883, xlixii. p. 316). The specific heat of beryllium has been calculated by L. Meyer (Berichte, 1880, 13, p. 1750) from the data of L. F. Nilson and O. Pettersson, and appears to increase rapidly with increasing temperature, the values obtained being 0.9073 at 20° C., 0.4481 at 73° -2 C. and 0.5819 at 256° -8 C.

Beryllium compounds are almost wholly prepared from beryl. The mineral is fused with potassium carbonate, and, on cooling, the fusible solution of beryllium salts is precipitated in the form of the hydroxide, which can be removed by evaporation; water is then added and the silica is filtered off. On concentration of the solution, the major portion of the aluminium present separates as alum, and the mother liquor redistilled with baryta and the remaining aluminium and beryllium salts together with a little alum. This is now treated for some days with a hot concentrated solution of ammonium carbonate, which precipitates the iron and aluminium but keeps the beryllium in solution. The iron and aluminium precipitates are filtered off, and the filtrate boiled, when a basic beryllium hydroxide containing a little ferric oxide is precipitated. To remove the iron, the precipitate is again dissolved in a concentrated solution of ammonium hydroxide, diluted, and the precipitate again filtered off. The process is repeated several times, and the final precipitate is dissolved in hydrochloric acid and precipitated by ammonia, washed and dried. It has also been obtained by J. Gibson (Journal of Chem. Soc., 1893, lxvii. p. 909) from beryl by conversion of the beryllium into its fluoride.

Beryllium oxide, beryllia or glicina, BeO, is a very hard white powder which can be melted and distilled in the electric furnace, with a yellow tinge in the form of a liquid, which on ignition it dissolves with difficulty in acids. The hydride Be(OH)2 separates as a white bulky precipitate on adding a solution of an alkali beryllium compound to a solution of aluminium hydroxide; and like those of aluminium and zinc, this hydride is soluble in excess of the alkaline hydroxide, but is precipitated on prolonged boiling. Beryllium chloride BeCl2, like aluminium chloride, may be prepared by the decomposition of the hydride in a current of oxygen or air. Beryllium sulphide is generally obtained from the hydrochloric acid solution of dry chlorine. It is deliquescent, and readily soluble in water, from which it separates on concentration in crystals of composition BeCl2.H2O. Its vapour density has been determined by Nilson and Pettersson, and found to be 14.53

The sulphate is obtained by dissolving the oxide in sulphuric acid; if the solution be not acid, it separates in pyramidal crystals of composition BeSO4.4H2O, while from an acid solution of this salt, crystals of composition BeSO4.7H2O are obtained. Double sulphates of beryllium and the alkalies are known, e.g. BeSO4.K2SO4.3H2O as are also many basic sulphates. The nitrate Be(NO3)2 is prepared by dissolving the oxide in a solution of nitric acid. The sulphate solution it crystallizes with difficulty and is very deliquescent. It readily yields basic salts.

Beryllium oxide BeO is formed when beryllia and sugar charcoal are heated together in the electric furnace. Like aluminium oxide it is slowly decomposed by water with the production of methane. Several basic carbonates are known, being formed by the addition of beryllium salts to solutions of the alkaline carbonates. The normal carbonate is prepared by passing a current of carbon dioxide through water containing the basic carbonate in suspension, the solution being filtered and concentrated over sulphuric acid in an atmosphere of carbon dioxide to obtain the carbonate, which is unstable and decomposes rapidly with evolution of carbon dioxide.

Beryllium sulphates are easily soluble and mostly have a sweet astrigent taste. The nitrate (s.p. from yolkos sweet); they are readily precipitated by alkaline sulphates (see Berichte, 1883, xxvii., p. 316) from solutions of the hydroxide, and may be distinguished from salts of other metals by the solubility of the oxide in ammonium carbonate. Beryllium is estimated quantitatively by precipitation with ammonia, and ignition to oxide. Its atomic weight has been determined by F. Nilson and O. Pettersson (Berichte, 1880, 13, p. 1451) by analyses of sulphur compounds from which the value 9.05, and by G. Brauner and H. Moof (Berichte, 1889, 22, p. 2558) for the dehydration of a solution of the oxide in ammonium sulphate, and from their obtained the value 9.05. C. L. Parsons (Journal, Amer. Chem. Soc., 1904, xxvi., p. 721) obtained the values 9.11 from analyses of beryllium acetonyl-acetate and beryllium basic acetate.

For a bibliography see C. L. Parsons, The Chemistry and Literature of Beryllium (1909).

BERYLLONITE, a mineral phosphate of beryllium and sodium, NaBePO4, found as highly complex orthorhombic crystals and as broken fragments in the disintegrated material of a granitic vein at Stoneham, Maine, where it is associated with felspar, smoky quartz, beryl and columbite. It was discovered by Prof. E. S. Dana in 1888, and named beryllonite because it contains beryllium in large amount. The crystals vary from his colourless to white or pale yellowish, and are transparent with a vitreous lustre; there is a perfect cleavage in one direction. Hardness 5.5-6; specific gravity 2.845. A few crystals have been cut and faceted, but, as the refractive index is higher than that of quartz, they do not make very brilliant gem-stones.

BERZELIUS, JÖNS JAKOB (1779-1848), Swedish chemist, born at Vänersunda Sorgard, near Linköping, Sweden, on the 20th (or 29th) of August 1779. After attending the gymnasium school at Linköping he went to Upsala University, where he studied chemistry and medicine, and graduated as M.D. in 1802. Appointed assistant professor of botany and pharmacy at Stockholm in the same year, he became full professor in 1805, and from 1815 to 1832 was professor of chemistry in the Caroline medico-chirurgical institution of that city. The Stockholm Academy of Sciences elected him a member in 1808, and in 1818 he became its perpetual secretary. The same year he was ennobled by Charles XIV, who in 1835 further made him a baron. His death occurred at Stockholm on the 7th of August 1848. During the first few years of his scientific career Berzelius was mainly engaged on questions of physiological chemistry, but about 1807 he began to devote himself to what he made the chief object of his life—that of elucidating the formula and constitution of chemical compounds through study of the law of multiple proportions and the atomic theory. Perceiving the exact determination of atomic and molecular weights to be of fundamental importance, he spent ten years in ascertaining that constant for some two thousand simple and compound bodies, and the results he published in 1818 attained a remarkable standard of accuracy, which was still further improved in a second table that appeared in 1826. He used oxygen—in his view the pivot round which the whole of chemistry revolves—as the basis of reference for the atomic weights of other substances, and the data on which his results were relied can be referred to by the exact study of chemical compounds, the doctrines of isomorphism, and Gay Lussac's law of volumes. When Volta's discovery of the electric cell became known, Berzelius, with W. Hisinger (1766-1832), began experiments on the electrolysis of salt solutions, ammonia, sulphuric acid, &c., and later this work led him to his electrochemical theory, a full exposition of which he gave in his memoir on the Theory of Chemical Proportions and the Chemical Action of Electricity (1814). This theory was founded on the supposition that the atoms of the elements are electrically polarized, the positive charge predominating in some and the negative in others, and from it followed his dualistic hypothesis, according to which compounds are made up of two electrically different components. At first this hypothesis was confined to inorganic chemistry, but subsequently he extended it to organic compounds, which he saw might similarly be regarded as containing a group or groups of atoms—a compound radicle—in place of simple elements. Although his conception of the nature of compound radicles did not long retain general favour—indeed he himself changed it more than once—he is entitled to rank as one of the chief founders of the radicle theory. Another service of the utmost importance which he rendered to the study of chemistry was in continuing and extending the labours of Le Verrier and his associates to establish a convenient system of chemical nomenclature. By using the initial letters of the Latin
BES, or Bès (Egypt, Bés or Bes), the Egyptian god of recreation, represented as a dwarf with large head, goggle eyes, protruding tongue, shaggy beard, a bushy tail seen between his bow legs hanging down behind (sometimes clearly as part of a skin girdle) and usually a large crown of feathers on his head. A Bes-like mask was found by Petrie amongst remains of the twelfth dynasty at the earliest temple of the goddess Besas in the temple of the queen Hatshepsut at Deir el Bahri (c. 1500 B.C.), where he is figured along with the hippopotamus goddess as present at the queen's birth. His figure is that of a grotesque mountebank, intended to inspire joy or drive away pain and sorrow, his hideousness being perhaps supposed actually to scare away the evil spirits. In its joyous aspect Bes plays the harp or flute, dances, &c. He is figured on mirrors, ointment vases and other articles of the toilet. Amulets and ornaments in the form of the figure or mask of Bes are common after the New Kingdom; he is often associated with children and with childbirth and is figured in the "birth-houses" devoted to the cult of the child-god. Perhaps the earliest known instance of his prominent appearance of large size in the sculptures of the temples is under Taharka, at Jebel Barkal, Nubia, at the beginning of the 7th century B.C. As the protector of children and others he is the enemy of noxious beasts, such as lions, crocodiles, serpents and scorpions. Large wooden figures of Bes are generally found to contain the remains of a human foetus. In the first centuries of our era an oracle of Besas was consulted at Abydos, where A. H. Sayce has found a flit concerning him and al- busts of it for consulting Besas in dreams. It has been held that Bes was of non-Egyptian origin, African, as Wiedemann, or Arabian or even Babylonian, as W. Max Müller contends; he is sometimes entitled "coming from the Divine Land" (i.e. the East or Arabia), or "Lord of Puoni" (Punt), i.e. the African coast of the Red Sea; his effigy occurs also on Greek coins of Arabia. It is remarkable also that, contrary to the usual rule, he is commonly represented in Egyptian sculptures and paintings full faced instead of in profile. But the connotation of the god with Puoni may have grown out of the fact that dwarf dancers were especially brought to Egypt from Ethiopia and Punt.

(F. L. G.)

BESANÇON, a city of eastern France, capital of the department of Doubs, 76 m. E. of Dijon by the Paris-Lyon railway. Pop. (1906) town, 42,760; commune, 56,168. It is situated on the eastern bank of the river Doubs, 820 ft. above sea-level at the foot of the western Jura, and is enclosed by hills in every direction. The Doubs almost surrounds the city proper forming a peninsula, the neck of which is occupied by a height crowned by the citadel; on the right bank lie populous industrial suburbs. The river is bordered by fine quays, and in places by the shady promenades which are a feature of Besançon. On the right bank there is a fine bathing establishment in the Mouillère quarter, supplied by the saline springs of Miserey. The cathedral of St Jean, the chief of the numerous churches of the town, was founded in the 4th century but has often undergone reconstruction and restoration; it resembles the Rhine churches of Germany in the possession of apses at each of its extremities. Several styles are represented in its architecture which for the most part is the work of the 11th, 12th and 13th centuries; the eastern apse and the tower date from the reign of Louis XV.

In the interior there are a "Madonna and Child" of Fra Bartolommeo and a number of other paintings and works of art. The archiepiscopal palace adjoining the cathedral is a building of the 18th century. The church of St. Madeleine belongs to the 18th and 19th centuries. The Palais de Granvelle, in the heart of the town, was built from 1544 to 1549 by Nicolas Perriard de Granvelle, chancellor of Charles V., and is the most interesting of the secular buildings. It is built round a square interior court surrounded by arcades, and is occupied by learned societies. The hôtel de ville dates from the 16th century, to which period many of the old mansions of Besançon also belong. The law-court, rebuilt in recent times, preserves a Renaissance façade and a fine audience-hall of the 18th century. Some relics of old military architecture survive, among them a cylindrical tower of the 13th century near the Porte Notre-Dame, the southern gateway, and the Porte Rivotte, a gate of the 16th century flanked by two round towers. The Roman remains at Besançon are of great archaeological value. Close to the cathedral there is a triumphal arch decorated with bas-reliefs known as the Porte Noire, which is generally considered to have been built in commemoration of the victories of Marcus Aurelius over the Germans in 167. It is in poor preservation and was partly rebuilt in 1820. Remains of a Roman theatre, of an amphitheatre, of an aqueduct which entered the town by the Porte Taille, a gate cut in the rock below the citadel, and an arch of a former Roman bridge, forming one of the modern bridges of the city, may be seen. Besançon has statues of Victor Hugo and of the Marquis de Jouvray-d'Abbans (b. 1751), inventor of steam-navigation.

Besançon is important as the seat of an archbishopric, a court of appeal and a court of assizes, as centre of an académie (educational division), as seat of a prefect and as headquarters of the VIIth army corps. It also has tribunals of first instance and of commerce, a chamber of commerce, a board of trade-arbitrators, an exchange and a branch of the Bank of France. Its educational establishments include the university with its faculties including the law, medicine, and pharmacy, an art school, the lycée Victor Hugo for boys, a lycée for girls, an ecclesiastical seminary, training colleges for teachers, and schools of watch-making, art, music and dairy-work. The library contains over 130,000 volumes, and the city has good collections of pictures, antiquities and natural history. The chief industry of Besançon is watch- and clock-making, introduced from the district of Neuchâtel at the end of the 18th century. It employs about 12,000 workpeople, and produces about three-fourths of the watches sold in France. Subsidiary industries, such as enamelling, are also important. The metallurgical works of the Société de la Franche-Comté are established in the city and there are saw-mills, printing-works, paper-factories, distilleries, and manufactories of boots and shoes, machinery, hosery, leather, elastic fabric, confectionery and artificial silk. There is trade in agricultural produce, wine, metals, &c.

The canal from the Rhone to the Rhine passes under the citadel by way of a tunnel, and the port of Besançon has considerable trade in coal, sand, &c.

As a fortress Besançon was one of a group which includes Dijon, Langres and Belfort; these are designed to secure Franche Comté and to cover a field army operating on the left bank of a German army of invasion. The citadel occupies the neck of the peninsula upon which the town stands; along the river bank in a semicircle is the town enceinte, and the suburb of Battant on the right bank of the Doubs is also "regularly" fortified as a bridge-head. These works, and Forts Chaudanne and Brégille
overlooking the Doubs at the bend, were constructed prior to 1870. The newer works enclose an area more suited to the needs of modern warfare: the chain of detached forts along the ridges of the left bank has a total of 14 forts, and the centre of this chain is supported by numerous forts and batteries lying between it and the citadel. On the other bank Fort Chaudanne is now the innermost of several forts facing towards the south-west, and the foremost of these works connects the fortifications of the left bank with another chain of detached forts on the right bank. The latter completely encloses a large area of ground in a semicircle of which Besançon itself is the centre, and the whole of the newer works taken together form an irregular ellipse of which the major axis, lying north-east by south-west, is formed by the Doubs.

Besançon is a place of great antiquity. Under the name of Vesonio it was, in the time of Julius Caesar, the chief town of the Sequani, and in 58 B.C. was occupied by that general. It was a rich and prosperous place under the Roman emperors, and Marcus Aurelius promoted it to the rank of a colonia as Colonia Victrix Sequanorum. During the succeeding centuries it was several times destroyed and rebuilt. The archbishopric dates from the close of the 2nd century, and the archbishops gradually acquired considerable temporal power. As the capital of the free county of Burgundy, or Franche-Comté, it was united with Burgundy and afterwards with France. In 1183 Frederick made it a free imperial city, and about the same time the archbishop obtained the dignity of a prince of the Empire. It afterwards became detached from the German kingdom, and during the 14th century came into the possession of the dukes of Burgundy, from whom it passed to the emperor Maximilian I., and his grandson Charles V. Cardinal Granvella, who was a native of the city, became archbishop in 1584, and founded a university which existed until the French Revolution. After the death of Charles V. it came into the possession of Spain, although it remained formally a portion of the Empire until its cession at the peace of Westphalia in 1648. During the 17th century it was attacked several times by the French, to whom it was finally ceded by the peace of Nijmegen in 1678. It was then fortified by the engineer Vauban. Until 1789 it was a seat of parlement. In 1814 it was invested and bombarded by the Austrians, and was an important position during the Franco-German War of 1870-71.

See A. Castan, Besançon et ses environs (Besançon, 1887); A. Gueudard, Besançon, description historique et descriptive (Besançon, 1860). Besançon is a city of 56,401 inhabitants, from its foundation in 844 till 1892. He married Mary, daughter of Mr. Eustace Foster-Barham of Bridgewater, and was knighted in 1895. He died at Hampstead, on the 9th of June 1903. Sir Walter Besant practised many branches of literary art with success, but he is most widely known for his long succession of novels, many of which have enjoyed remarkable popularity. His first stories were written in collaboration with James Rice (q.v.). Two at least of these, The Golden Butterfly (1856) and Ready-Money Mortality (1872), are among the most vigorous and most characteristic of his works. Though not without exaggeration and eccentricity, attributable to the influence of Dickens, they are full of rich humour, shrewd observation and sound common-sense, and contain characters which have taken their place in the long gallery of British fiction. After Rice's death, Sir Walter Besant wrote alone, and in All Sorts and Conditions of Men (1882) produced a stirring story of East End life in London, which set on foot the movement that culminated in the establishment of the People's Palace in the Mile End Road. Though not himself a pioneer in the effort made by Canon Barnett and others to alleviate the social evils of the East End by the personal contact of educated men and women of a superior social class, his books rendered immense service to the movement by popularizing it. His sympathy with the poor was shown in another attempt to stir public opinion, this time against the evils of the sweating system, in The Children of Gideon (1886).

Other popular novels by him were Dorothy Forsier (1884), Armored of Lyonesse (1886), and Beyond the Dreams of Avarice (1890). He also wrote historical and biographical works, including The French Humorists (1873), Rabelais (1876), and lives of Coligny, Whittington, Captain Cook and Richard Jefferies. Besant undertook a series of important historical and archaeological volumes, dealing with the associations and development of the various districts of London—of which the most important was A Survey of London, unfortunately left unfinished, which was intended to do for modern London what Stow did for the Elizabethan city. Other books on London (1892), Westminster (1895) and South London (1898) showed that his mind was full of his subject. No man of his time evinced a keener interest in the lore of the past and the records of the present than the author of literary works, and the conditions of the literary career in England were largely due to his energetic and capable exposition of the commercial value of authorship and to the unsellish efforts which Sir Walter constantly made on behalf of his fellow-workers in the field of letters.

See also Autobiography of Sir Walter Besant (1902), with a preface by S. S. Pringle; the preface to the library edition (1897) of Ready-Money Mortality contains a history of the literary partnership of Besant and Rice.

BESANVAL DE BRONSTATT, PIERRE VICTOR, BARON DE (1772-1870), French soldier, was born at Soleure. He was the son of Jean Victor Besenval, colonel of the regiment of Swiss guards in the pay of France, who was charged in 1709 by Louis XIV. with a mission to Sweden, to reconcile Charles XII. with the tsar Peter the Great, and to unite them in alliance with France against England. Pierre Victor served at first as aide-de-camp to Marshal Broglie during the campaign of 1748 in Bohemia, then as aide-de-camp to the duke of Orleans during the Seven Years' War. He then became commander of the Swiss Guards. When the Revolution began Besenval remained loyal, and rode to Paris to reconcile the court to the king. He later joined the troops which the king had concentrated on Paris in July 1789—a movement which led to the taking of the Bastille on the 14th of July. Besenval showed inconsistency in the crisis, and attempted to flee. He was arrested, tried by the tribunal of the Châtelet, but acquitted. He then fell into obscurity and died in Paris in 1794. Besenval de Bronstatt is principally known as the author of Mémoires, which were published in 1825-1827 by the vicomte T. A. de Ségur, in which are reported many scandalous tales, true or false, of the court of Louis XVI. and Marie Antoinette. The authenticity of these memoirs is not absolutely established.

BESEKOW, BERNHARD VON, BARON (1796-1868), Swedish dramatist and historian, son of a Stockholm merchant, was born on the 19th of April 1796. His vocation for literature was assisted by his tutor, the poet Johan Magnus Stenstolpe (1777-1831), whose works he edited. He entered the civil service in 1814, was ennobled in 1826 and received the title of baron in 1843. He held high appointments at court, and was, from 1834 onwards, perpetual secretary of the Swedish academy, using his great influence with tact and generosity. His poetry is over-decorated, and his plays are grandiose historical poems in dramatic form. Among them are "Erik XIV." (2 parts, 1826); and four pieces collected (1836-1838) as Dramatiska Studier, the most famous of which is the tragedy of "Thorkel Knutsson." His works include many academical memoirs, volumes of poems, philosophy and a valuable historical study,
Om Gustav den Tredje såsom konung och menniska (5 vols. 1860-1869, "Gustavus III. as king and man"), printed in the transactions of the Swedish Academy (vols. 32, 34, 37, 47, 44). He died on the 17th of October 1868.

See also a notice by C. D. af Wirsén in his Lefnadssteckningar (Stockholm, 1901).

BESNARD, PAUL ALBERT (1849- ), French painter, was born in Paris and studied at the École des Beaux-Arts, winning the Prix de Rome in 1874. Until about 1885 he followed the academic tradition, but then broke away completely, and devoted a study of colour and light as conceived by the impressionists. The realism of this group never appealed to his bold imagination, but he applied their technical method to ideologcal and decorative works on a large scale, such as his frescoes at the Sorbonne, the École de Pharmacie, the Salle des Sciences at the hôtel de ville, the mairie of the first arrondissement, and the chapel of Berck hospital, for which he painted twelve " Stations of the Cross " in an entirely modern spirit. A great virtuoso, he achieved brilliant successes alike in water-colour, pastel, oil and etching, both in portraiture, in landscape and in decoration. A good example of his daring unconventionality is his portrait of Madame Régane; and his close analysis of light can be studied in his picture " Femme qui se chaufle " at the Luxembourg in Paris.

BESOM (Old Eng. besema, a rod), originally a bundle of rods or twigs, used for sweeping, &c.; a stiff broom.

BESSARABIA, a government of south-west Russia, separated on the W. and S. from Moldavia and Walachia by the Pruth, and on the E. and N. from the Russian governments of Podolia and Kherson by the Dniester; on the S.E. it is washed by the Black Sea. Area, 17,614 sq. m. The northern districts are invaded by offshoots of the Carpathians, which reach altitudes of 800 to 1500 ft., and are cut up by numerous ravines and river valleys. Here, however, agriculture is the prevailing occupation, the soil being the fertile black earth. The crops principally raised are wheat and maize, though here, as well as in other parts of the government, barley, flax, tobacco, water-melons, gourds, fruit, wine, saffron and madder are grown. The middle of the government is also hilly (850-1000 ft.), and is heavily timbered, chiefly with beech, oak and mountain-shag, and, though to a smaller extent, with birch. The districts south of the old Roman earthworks which once connected the Pruth and the Danube, and line the Botna, just south of Bender, consist of level pasture-land known as the Budjak stęppe. Here stock-breeding is the predominant calling, the people owning large numbers of sheep, cattle and horses, also goats, pigs and buffaloes. Lagoons fringe the lower course of the Pruth and the coast of the Black Sea, and marshy ground exists beside the Reuth and other tributaries of the Dniester. The climate is rather subject to extremes, the mean temperature for the year, at Kishinev, being 50° Fahr., of January 37°, and of July 72°. The rainfall amounts to over 25 in. annually. Salt, saltpetre and marble are the principal mineral products. Manufacturing industry is only just beginning, wine-making (17,000,000 gallons annually), cloth-mills, iron-works, soap-works and tanneries being the principal branches. Both the Dniester and the Pruth are important waterways commercially, the former being navigable up to Mogilev and the latter to Levoč (46° 30' N. lat.). Down the Dniester come timber and wooden wares from Galicia, and grain and wool from Bessarabia itself. Three branches of the railway from Odessa to Poland penetrate the government and proceed towards the Carpathians. The population numbered 988,431 in 1860 and 1,698,326 in 1897, of whom only 329,852 were urban, while 968,479 were rural. In 1906 it was estimated at 2,362,400. It consists of various races, nearly one-half (920,919 in 1897) being Moldavians, the others Little Russians, Jews (37% in the towns and 12% in the rural districts), Bulgarians (103,272), Germans (60,606), with some Gypsys (Zigan), Greeks, Armenians, Tatars and Albanians. The Germans, who form some thirty prosperous colonies in the Budjak steppes west from Akkerman, have been settled there since about 1814. The government is divided into eight districts, the chief towns of which are Akkerman (pop. 33,470 in 1900), Bender (33,741 in 1900), Byelitsi (18,536 in 1897), Izmaïl (33,607 in 1900), Khotin (18,126), Kishinev (125,787 in 1900), Orșova (13,356), and Soroki (25,523 in 1900). The capital is Kishinev. Kapul on the Pruth, and Reni on the Danube (the place to which Alexander of Bulgaria was carried when kidnapped by the Russians in 1886), are small, but lively, river-port.

The original inhabitants were Cimmerians, and after them came Scythians. During the early centuries of the Christian era Bessarabia, being the key to one of the approaches towards the interior of the empire, was invaded by many successive waves. In the 2nd century it was invaded by the Geæa, a Thracian tribe, whom the Roman emperor Trajan conquered in 106; he then incorporated the region in the province of Dacia. In the following century the Goths poured into this quarter of the empire, and in the 5th it was overrun once after the other by the Huns, the Avars and the Bulgarians. Then followed in the 7th century the Bessi, a Thracian tribe, who gave their name to the region, and in the 9th the Ugrians, that is to say the ancestors of the present Magyars of Hungary, the country being called Transylvania. The Ugrians were forced farther west by the Turkish tribe of the Petchengers in the 10th century, and these were succeeded in the 11th century by the Kumanis (Comani) or Polovtsians, a kindred Turkish stock or federation. In the 13th century Bessarabia was overrun by the irresistible Mongols under the leadership of Batu, grandson of Jenghiz Khan. In this century also the Genoese founded trading factories on the banks of the Dniester. In 1367 Bessarabia was subdued and annexed by the ruling prince of Moldavia. During the 16th century it was in the possession alternately of the Turks and the Nogais or Don Cossacks. From c. 1530 to 1830 the autonomous principality of Bessarabia was the land of the Bessarabs, whose story he has related. In 1437 he was made archbishop of Nicaea by John VII. Palaeologus, whom he accompanied to Italy in order to bring about a union between the Greek and Latin churches with the object of obtaining help from the West against the Turks. The Greeks had bitterly resented his attachment to the party which saw no difficulty in a reconciliation of the two churches. At the councils held in Ferrara and Florence Bessarion supported the Roman church, and gained the favour of Pope Eugenius IV., who invested him with the rank of cardinal. From that time he resided permanently in Italy, doing much by his patronage of learned men, by his collection of books and manuscripts, and by his own writings, to spread abroad the new learning. He held in succession the archbishopric of Siponto and the bishoprics of Sabina and Frascati. In 1463 he received the title of Latin patriarch of Constantinople; and it was only on account of his Greek birth that he was not elevated to the papal chair. For five years (1450-1455) he was legate at Bologna, and he was engaged on embassies to many foreign princes, among others to Louis XI. of France in 1471. Vexation at an insult offered him by Louis is said to have hastened his death, which took place on the 19th

BESNARD—BESSARION
of November 1472, at Ravenna. Bessarion was one of the most learned scholars of his time. Besides his translations of Aristotle's *Metaphysics* and Xenophon's *Memorabilia*, his most important work is a treatise directed against George of Trebizond, a violent Aristotelian, entitled *In Colummadiorem Platonis*. Bessarion, though a Platonist, is not so thoroughgoing in his admiration as Gemistus Pletho, and rather strives after a reconciliation of the two philosophies. His work, by opening up the relations of Platonism to the metaphysical questions of religion, contributed greatly to the extension of speculative thought in the department of theology. His library, which contained a very extensive collection of Greek MSS., was presented by him to the senate of Venice, and formed the nucleus of the famous library of St Mark.

See A. M. Bandini, *De Vita et Rebus Gestis Besserioni* (1777); H. Vaur, *Le Cardinal Bessarion* (1839); E. Legrand, *Bibliographie Hellenique* (1885); G. Voigt, *Die Wiederbelebung des klassischen Altertums*, ii. (1893); on Bessarion at the councils of Ferrara and Florence, A. Sadov, *Bessarion de Nice* (1883); on his philosophy, monograph by A. Kandelos (in Greek: Athens, 1888); most of his works are in Migne, *Patrologia Graeca*, cxxi.

**BESSBOROUGH, EARLS OF.** The Ponsonby family, who have contributed many conspicuous men to Irish and English public life, trace their descent to Sir John Ponsonby (d. 1678), of Cumberland, a Commonwealth soldier who obtained land grants in Ireland. His son William (1657-1724) was created Lord Bessborough (1717) and Viscount Dunsborn (1723), and the latter's son Brabazon was raised to the earldom of Bessborough in 1739. He was the father not only of the 2nd earl (1704-1793), but of John Ponsonby (q.v.), speaker of the Irish House of Commons. The 2nd earl was a well-known Whig politician, who held various offices of state; and his son the 3rd earl (1758-1844) was father of the 4th earl (1781-1847), first commissioner of works in 1834-1834, lord privy seal from 1835 to 1839 and lord-lieutenant of Ireland in 1846. He was succeeded by his three sons, the 4th earl (d. 1880), 6th earl (1815-1895), a famous cricketer and chairman of the Bessborough commission which gave the Irish ladies' place and 7th earl (d.1906), and the last named by his son the 8th earl.

**BESSÈGES,** a town of south-eastern France, in the department of Gard, on the Cèze, 20 m. north of Alès by rail. Pop. (1906) 7652. The town is important for its coal-mines, blast-furnaces and iron-works.

**BESSEL, FRIEDRICH WILHELM** (1784-1846), German astronomer, was born at Minden on the 22nd of July 1784. Placed at the age of fifteen in a counting-house at Bremen, he was inspired by his desire to obtain a situation as supercargo on a foreign voyage to study navigation, mathematics and foreign languages. In 1804 he calculated the orbit of Halley's comet from observations made in 1607 by Thomas Harriot, and communicated his results to H. W. M. Olbers, who procured their publication (*Monatliche Correspondenz*, x. 423), and recommended the young aspirant in 1805 for the post of assistant in J. H. Schröter's observatory at Lilienthal. A masterly investigation of the comet of 1807 (Königsberg, 1810) enhanced his reputation, and the king of Prussia summoned him, in 1810, to superintend the erection of a new observatory at Königsberg, of which he acted as director from its completion in 1813 until his death. The position of director he maintained in every respect, and he was a guiding light in modern astronomy. For the purpose of improving knowledge of star-places he reduced James Bradley's Greenwich observations, and derived from them an invaluable catalogue of 3322 stars, published in the volume rightly named *Fundamenta Astronomiae* (1818). In *Tabulae Residuum* (1830), he definitively established the uniform system of reduction still in use. During the years 1821-1834, he observed all stars to the ninth magnitude in zones extending from -15° to +45° dec., and thus raised the number of those accurately determined to about 50,000. He corrected the length of the seconds' pendulum in 1806, in a discussion re-published by H. Bruns in 1889, measured an arc of the meridian in East Prussia in 1831-1832, and deduced for the earth in 1834 an ellipticity of $\frac{1}{4}$.$^3$. His ascertainment in 1838 (*Astr. Nach.*, Nos. 365-366) of a parallax of $0^\circ.34$ for 61 Cygni was the first authentic result of the kind published. He announced in 1844 the binary character of Sirius and Procyon from their disturbed proper motions; and was preparing to attack the problem solved later by the discovery of Neptune, when fatal illness intervened. He died at Königsberg on the 17th of March 1846. Modern astronomy of precision is essentially Bessel's creation. Apart from the large scope of his activity, he introduced such important novelties as the effect of the helmet, the correction for personal equation (in 1834), and the systematic investigation of instrumental errors. He issued 21 volumes of *Astronomische Beobachtungen auf der Sternwarte zu Königsberg* (1835-1844), and a list of his writings drawn up by A. L. Busch appeared in vol. 24 of the same series. Special attention should be directed to his *Astronomische Untersuchungen* (2 vols. 1841-1842), *Populäre Vorlesungen* (1858), edited by H. C. Schumacher, and to the important collection entitled *Abhandlungen* (4 vols. 1875-1882), issued by R. Engelmann at Leipzig. His minor treatises numbered over 350. In pure mathematics he enlarged the resources of analysis by the invention of Bessel's Functions. He made some preliminary use of these expressions in 1817, in a paper on Kepler's Problem (*Transactions Berlin Academy*, 1816-1817, p. 49), and fully developed them seven years later, for the purposes of a research into planetary perturbations (*Ubbld.*, 1824, pp. 1-52).

**Bessel function,** a certain mathematical relation between two variables. The Bessel function of order $m$ satisfies the differential equation $x^2 u''' + x u'' + (1 - m^2) u = 0$, and may be expressed as the series

$$u = \sum_{n=0}^{\infty} a_n x^n,$$

the function of zero order is deduced by making $m=0$, and is equivalent to the series $x^2 + x^2 + \cdots$. O. Schlömlt defines these functions as the coefficients of the power of $t$ in the expansion of $\exp \left( \frac{1}{t} \right)$. The symbol generally adopted to represent these functions is $J_m (\phi)$ where $m$ denotes the order of the function. These functions are named after Friedrich Wilhelm Bessel, who in 1817 introduced them in an investigation on Kepler's Problem. He discussed their properties and constructed tables for their evaluation. Although Bessel was the first to systematically treat of these functions, it may be noted that in 1732 Daniel Bernoulli obtained the function of zero order as a solution to the problem of the oscillations of a chain suspended at one end. This problem has been more fully discussed by Sir A. G. Greenhill. In 1764 Leonard Euler employed the functions of both zero and integral orders in an analysis into the vibrations of a stretched membrane; an investigation which has been considerably developed by Lord Rayleigh, who has also shown (1878) that Bessel's functions are particular cases of Laplace's functions. There is hardly a branch of mathematical physics which is independent of these functions. Of the many applications we may notice: Joseph Fourier's (1824) investigation of the motion of heat in a solid cylinder, a problem which, with the related one of the flow of electricity, has been developed by W. E. Weber, G. F. Riemann and S. D. Poisson; the flow of electromagnetic waves along wires (Sir J. J. Thomson, H. Hertz, O. Heaviside); the diffusion of light (E. L. Lamm, Lord Rayleigh, Georg Wilhelm Struve); the theory of elasticity (A. E. Love, H. Lamb, C. Chree, Lord Rayleigh); and to hydrodynamics (Lord Kelvin, Sir G. Stokes).

The remarkable connexion between Bessel's functions and spherical harmonics was established in 1868 by F. G. Mehler, who proved that a simple relation existed between the function of zeros order and the harmonic of order $n$. Heinrich Eduard Heine has shown that the functions of higher orders may be considered as limiting values of the associated functions;
BESSEMER—BESSIÈRES

283

this relation was discussed independently, in 1878, by Lord Rayleigh.

For the mathematical investigation see SPHERICAL HARMONICS and for tables see Table, Mathematical.

See A. Gray and G. B. Matthews, Treatise on Bessel's Functions (1861) and repertorium der math. Wissenschafter. I. F. W. Bessel, Untersuchung des Teils der planetarischen Störungen (1824).

BESSEMER, SIR HENRY (1813-1898), English engineer, was born on the 19th of January 1813, at Charlton, in Hertfordshire. Throughout his life he was a prolific inventor, but his name is chiefly known in connexion with the Bessemer process for the manufacture of steel, by which it has been rendered famous throughout the civilized world. Though this process is now largely supplemented, and even displaced, by various rival processes, at the time it was brought out it was of enormous industrial importance, since it effected a great cheapening in the price of steel, and led to that material being widely substituted for others which were inferior in almost every respect but that of cost. Bessemer's attention was drawn to the problem of steel manufacture in the course of an attempt to improve the construction of guns. Coming to the conclusion that if any advance was to be made in artillery better metal must be available, he established a small ironworks in St Pancras, and began a series of experiments. These he carried on for two years before he evolved the essential idea of his process, which is the decarbonization of cast iron by forcing a blast of air through the mass of metal when in the molten condition. The first public announcement of the process was made at the Cheltenham meeting of the British Association in 1856, and immediately attracted considerable notice. Many metallurgists were sceptical on theoretical grounds about his results, and only became convinced when they saw that his process was really able to convert melted cast iron into malleable iron in a perfectly fluid state. But though five firms applied without delay for licences to work under his patents, success did not at once attend his efforts; indeed, after several ironmasters had put the process to practical trial and failed to get good results, it was in danger of being thrust aside and entirely forgotten. Its author, however, instead of being discouraged by this lack of success, continued his experiments, and in 1859 was able to turn out a product, the quality of which was not inferior to that yielded by the older methods. But when he now tried to induce makers to take up his improved system, he met with general rebuffs, and finally was driven to undertake the exploitation of the process himself. To this end he erected steelworks in Sheffield, on ground purchased with the help of friends, and began to manufacture steel. At first the output was insignificant, but gradually the magnitude of the operations was enlarged until the competition became effective, and steel traders generally became aware that the firm of Henry Bessemer & Co. was undertaking a certain to the extent of £20 a ton. This argument to the pocket quickly had its effect, and licences were applied for in such numbers that, in royalties for the use of his process, Bessemer received a sum in all considerably exceeding a million sterling.

Of course, patents of such obvious value did not escape criticism, and invalidity was freely urged against them on various grounds. But Bessemer was fortunate enough to maintain them intact without litigation, though he found it advisable to buy up the rights of one patentee, while in another case he was freed from anxiety by the patent being allowed to lapse. In 1859 through non-payment of fees. At the outset he had found great difficulty in making steel by his process—in his first licences to the trade iron alone was mentioned. Experiments he made with South Wales iron were failures because the product was devoid of malleability; Mr Göransson, a Swedish ironmaster, using the purer charcoal pig iron of that country, was the first to make good steel by the process, and even he was successful only after many attempts. His results prompted Bessemer to try the purer iron obtained from Cumberland haematite, but even with this he did not meet with much success, until Robert Mushet showed that the addition of a certain quantity of spiegelstein had the effect of removing the difficulties.

Whether or not Mushet's patents could have been sustained, the value of his procedure was shown by its general adoption in conjunction with the Bessemer method of conversion. At the same time it is only fair to say that whatever may have been the conveniences of Mushet's plan, it was not absolutely essential; this Bessemer proved in 1865, by exhibiting a series of samples of steel made by his own process alone. The pecuniary rewards Bessemer's great invention came to him with comparative quickness; but it was not till 1875 that the Royal Society admitted him as a fellow and the government honoured him with a knighthood. Bessemer died at Denmark Hill, London, on the 15th of March 1898.

Among Bessemer's numerous other inventions, not one of which attained a tith of the success or importance of the steel process, were movable dies for embossed stamps, a gold paint, sugar machinery, and a ship which was to save her passengers from the miseries of mail de mer. This last had her saloon mounted in such a way as to be free to swing relatively to the boat herself, and the idea was that this saloon should always be maintained steady and level, no matter how rough the sea. For this purpose hydraulic mechanism of Bessemer's design was arranged under the control of an attendant, whose duty it was to keep watch on a spirit-level, and counteract by proper manipulation of the apparatus any deviation from the horizontal that might manifest itself on the floor of the saloon owing to the rolling of the vessel. A boat, called the "Bessemer," was built on this plan in 1873 and put on the cross-Channel service to Calais, but the mechanism of the swinging saloon was not found effective enough to render the vessel permanently removed.

An Autobiography was published in 1895.

BESSEMER, a town of Jefferson county, Alabama, U.S.A., about 12 m. S.W. of Birmingham, a little N. of the centre of the state. Pop. (1890) 4544; (1900) 6538, including 3605 negroes; (1910) 10,864. The town is served by the Alabama Great Southern (Queen & Crescent route), the Louisville & Nashville, the Kansas City, Memphis & Birmingham (St Louis & San Francisco system), the Birmingham Southern, and the Atlanta, Birmingham & Atlantic railways. Bessemer is situated in the midst of the iron ore and limestone district of Alabama, in the south part of Jones' Valley (about 3 m. wide); to the east is the Red Ore mountain range, rich in red haematite; to the north-west are the Warrior coalfields; to the south-west, south and south-east are immense fossiliferous iron ore seas and the Cahaba coalfields; in the immediate vicinity of the city are limestone quarries, and about 18 m. north-east are the lime-stone kilns of Gate City. Mining, iron smelting and the manufacture of iron and coke are the chief industries of Bessemer; truck farming is also an important industry. In 1900 Bessemer was the eighth city of the state in population, second in amount of capital invested in manufacturing, and fourth in value of its manufactured product for the year. Bessemer was laid out in 1857, and was incorporated in 1889.

BESSIÈRES, JEAN BAPTISTE, duke of Istri (1768-1813), French marshal, was born near Cahors in 1768. He served for a short time in the "Constitutional Guard" of Louis XVI. and as a non-commissioned officer took part in the war against Spain. In the Army of the Eastern Fyrenees and in the Army of the Moselle he repeatedly distinguished himself for valour, and in 1796, as captain, he served in Bonaparte's Italian campaign. At the Battle of Roversenda, he conducted him to his chief's notice, and after Rivoli he was sent to France to deliver the captured colours to the Directory. Hastening back to the front, he accompanied Napoleon in the invasion of Storia in command of the "Guides," who formed the nucleus of the later Consular and Imperial Guard. As chef de brigade he next served in the Egyptian expedition, and won further distinction at Acre and Aboukir. Returning to Europe with Napoleon, he was present at Marengo (1800) as second-in-command of the Consular Guard, and led a brilliant and successful cavalry charge at the close of the day, though his aspect on the battle was described by Napoleon pretended. Promoted general of division in 1802 and marshal of France in 1804, he made the most famous
campaigns of the Grande Armée as colonel-general of the Guard Cavalry (1805, 1806, 1807). In 1805 he had received the Grand Eagle of the Legion of Honour, and in 1809 was created duke of Istrìa. With the outbreak of the Peninsular War, Marshal Bessières had his first opportunity of an independent command, and his crushing victory over the Spaniards at Medina del Rio Seco (1808) justified Napoleon's choice. When disaster in other parts of the theatre of war called Napoleon himself to the Peninsula, Bessières continued to give the emperor the very greatest assistance in his campaign. In 1809 he was again with the Grande Armée in the Danube valley. At Easing his repeated and desperate charges checked the Austrians in the full tide of their success. At Wagram he had a horse killed under him. Replacing Bernadotte in the command of the Army of the North, a little later in the same year, the newly-created duke of Istrìa successfully opposed the British Walcheren expedition, and in 1811 he was back again, in a still more important command, in Spain. As Masséna's second-in-command he was present at the battle of Fuentes d'Oñoro, but Napoleon never detached him for very long, and in 1812 he commanded the Guard Cavalry at Borodino and in the retreat from Moscow. Wherever engaged he won further distinction, and at the beginning of the 1813 campaign he was appointed to the command of the whole of Napoleon's cavalry. Three days after the opening of the campaign, while reconnoitring the defile of Pozerna-Rippach, Bessières was killed by a musket-ball. Napoleon, who deeply felt the loss of one of his truest friends and ablest commanders, protected his children, spoil and his horse. When disaster in other parts of the Army of the Pyrenees occurred, Bessières was made Marshal of France and Chief of the General Staff. After serving with a good record in Italy, in Egypt and at Hohenlinden, he had a command in the Grande Armée, and in 1808 was sent to Spain. He commanded a division in Catalonia and played a notable part at the action of Molins de Rey near Barcelona. Disagreements with his superior, General Duhesme, led to his resignation, but he subsequently served with Napoleon in all the later campaigns of the empire. Placed on the retired list by the Bourbons, his last public act was his defence of the unfortunate Ney. The rest of his long life was spent in retirement.

**BEßUS**, satrap of Bactria and Sogdiana under Darius III. In the battle of Gaugamela (1st of October 331) he commanded the troops of his satrapy. When Alexander pursued the Persian king on his flight to the East (summer 330), Bessus with some of the other conspirators deposed Darius and shortly afterwards killed him. He then tried to organize a national resistance against the Macedonian conqueror in the eastern provinces, proclaimed himself king and adopted the name Artaxerxes. But he was taken prisoner by treachery in the summer of 329. Alexander sent him to Ecbatana, where he was condemned to death. Before his execution his nose and ears were cut off, according to the Persian custom; we learn from the Behistun inscription that Darius I. punished the usurpers in the same way.

**Best, William Thomas** (1826-1897), English organist, the son of a solicitor, was born at Carlisle on the 13th of August 1826. Having decided upon a musical career, he received his first instruction from the cathedral organist. He applied himself especially to Bach's music, and became a greater player of great skill. His successive appointments were to Pembroke chapel, Liverpool, 1849; to a church for the blind, 1847, and the Liverpool Cathedral in 1852. For a short time (1854-1855) he was in London at the Panopticon in Leicester Square, the church of St Martin-in-the-Fields, and Lincoln's Inn chapel. In 1855 he returned to Liverpool as organist of St George's Hall, where his performances rapidly became famous throughout England. Ill-health compelled him at last to retire in 1894. He was engaged as solo organist at all the Handel festivals at the Crystal Palace, and also as organist at the Albert Hall, where he inaugurated the great organ in 1871. He had been in the receipt of a civil list pension of £100 a year since 1880; and in 1880 went to Australia to give organ recitals in the town hall of Sydney. Best died at Liverpool on the 10th of May 1897.

His command over all the resources of his own instrument was masterly; his series of Saturday recitals at St George's Hall, carried on for many years, included the whole field of organ music, and of music that could be arranged for the organ, ancient and modern; and his performances of Bach's organ works were particularly fine. His own compositions for the organ, chiefly comprised in the publication entitled *Organ Pieces for Church Use*, have a strong and marked individuality. Best, unlike many solists, was an all-round musician, and fully acquainted with every branch of the art. His bust, by Conrad Dressler, has been placed on the platform in front of the Liverpool organ, as a memorial of his long series of performances there.

**BESTIA,** the name of a family in ancient Rome, of which the following were the most distinguished.

1. *Lucius Calpurnius Bestia,* Roman tribune of the people in 121 B.C., consul in 111. Having been appointed to the command of the operations against Jugurtha, he took it first on the campaign energetically, but soon, having been accused of corruption, was dismissed. It was, however, ordered that he return to Rome. He was brought to trial for his conduct and condemned, in spite of the efforts of Marcus Scaurus who, though formerly his legate and equally guilty, was one of the judges. He is probably identical with the Bestia who encouraged the Italians in their revolt, and went into exile (90) to avoid punishment under the law of Q. Varius, whereby those who had secretly or openly aided the Italian allies against Rome were to be brought to trial (*Appian, Bell. civ. i. 57; Val. Max. viii. 6. 4*). Both Cicero and Sallust express a high opinion of Bestia's abilities, but his love of money demoralized him. He is mentioned in a Carthaginian inscription as one of a board of three, perhaps an agricultural commission.

2. *Lucius Calpurnius Bestia,* one of the Catilinarian conspirators, possibly a grandson of the above. He was tribune elect in 63, and it had been arranged that, after entering upon his office, he should publicly accuse Cicero of responsibility for the impending war. This was to be the signal for the outbreak of revolution. The conspiracy, however, was put down and Bestia was put to death after delivering a violent attack upon his consul on the expiration of his office. This Bestia is probably not the Lucius Calpurnius Bestia, aedile, and a candidate for the praetorship in 37. He was accused of bribery during his candidature, and, in spite of Cicero's defence, was condemned. In 43 he attached himself to the party of Antony, apparently in the hope of obtaining the consulship.

3. *Sallust, Catiline,* xvii. 43; *Appian, Bell. civ. iii.* 3; Cicero, *Ad Q. Fr. ii.* 3, 6.

**BEßUZHEV-Ryumin, Alexius Petrovich, Count** (1665-1768), grand chancellor of Russia, the second son of Count Peter Bestuzhev. The early favourite of the empress Anne, was born at Moscow on the 1st of June 1663. Educated abroad, with his elder brother Mikhail, at Copenhagen and Berlin, he especially distinguished himself in languages and the applied sciences. After the Great in 1712, attached him to Prince Kurakin at the Utrecht Congress that he might learn diplomacy, and for the same reason permitted him in 1713 to enter the service of the elector of Hanover. George I. took him to London in 1714, and sent him to St Petersburg as his accredited minister with a notification of his accession. Bestuzhev then returned to England, where he remained four years. It was the necessary apprenticeship to his brilliant diplomatic career. His passion for intrigue is curiously illustrated by his letter to the tsarevich
Alexius at Vienna, assuring his "future sovereign" of his devotion, and representing his sojourn in England as a deliberate seclusion of a zealous but powerless well-wisher. This extraordinary indicence might well have cost him his life, but the tsarevich fortunately destroyed the letter. On his return to Russia he served for two years without any salary as chief gentleman of the Bedchamber at the court of Anne of Courland, and in 1721 succeeded Vasily Dolgoruki as Russian minister at Copenhagen. Copenhagen was then a whirlpool of diplomatic intrigue, for George I. was endeavouring to arm the northern powers against Peter the Great, and this it was Bestuzhev's mission to counteract. On the occasion of the peace of Nystad, which terminated the 21 years' war between Russia and Sweden, Bestuzhev resigned and struck a definitive alliance, panegyric Latin inscription, which so delighted Peter (then at Derben) that he sent a letter of thanks written with his own hand and his portrait set in brilliants. It was at this time too that the many-sided Alexius invented his famous "drops," or tintura toniconervina Bestuschoffi, the recipe of which was stolen by the French brigadier Lamotte, who made his fortune by introducing it at the French court, where it was known as Elixir d'Or.

The sudden death of Peter the Great seriously injured Bestuzhev's prospects. For more than ten years he remained at Copenhagen. Looking vainly towards Russia as a sort of promised land from which he was excluded by enemies or rivals. He rendered some important services, however, to the empress Anne, for which he was decorated and made a privy councillor. He also won the favour of Biren, and on the tragic fall of Artemy Volinsky in 1730 was summoned home to take his place in the council. He assisted Biren to obtain the regency in the last days of the empress Anne, but when his patron fell three weeks later, his own position became extremely precarious. His chance came when the empress Elizabeth, immediately after her accession, summoned him back to command and act as vice-chancellor during twenty years. During a period of exceptional difficulty, he practically controlled the foreign policy of Russia. Bestuzhev rightly recognized that, at this time, France was the natural enemy of Russia. The interests of the two states in Turkey, Poland and Sweden were diametrically opposed, and Russia could never hope to be safe from the intrigues of France in these three borderlands. All the enemies of France were thus necessarily the friends of Russia, and her friends Russia's enemies. Consequently Great Britain, and still more Austria, were Russia's natural allies, while the aggressive and energetic kind of Russian policy was desired against France. It was, therefore, the policy of Bestuzhev to bring about a quadruple alliance between Russia, Austria, Great Britain and Saxony, to counterpoise the Franco-Prussian league. But he was on dangerous ground. The empress herself was averse from an alliance with Great Britain and Austria, whose representatives had striven to prevent her accession; and many of her personal friends, in the pay of France and Prussia, took part in innumerable conspiracies to overthrow Bestuzhev. Nevertheless, step by step, Bestuzhev, aided by his elder brother Mikhail, carried out his policy. On the 11th of December 1742, a defensive alliance was concluded between Great Britain and Russia. Bestuzhev had previously rejected with scorn the proposals of the French government to mediate between Russia and Sweden on the basis of a territorial surrender on the part of the former; and he conducted the war so vigorously that by the end of 1742 Sweden lay at the mercy of the empress. At the peace congress of Álbio (January–August 1743) he insisted that the whole of Finland should be ceded to Russia, by way of completing the testament of Peter the Great. But the French party contrived to get better terms for Sweden, by artfully appealing to the empress's fondness for the house of Holstein. The Swedes, at the desire of Elizabeth, accepted Adolphus Frederick, duke of Holstein, as their future king, and, in return, received back Finland, with the exception of a small strip of land up to the river Kynmene. Nor could

1 A copy of the letter was taken by way of precaution, beforehand, by the Austrian ministers, and this copy is still in the Vienna archives.

Bestuzhev prevent the signing of a Russo-Prussian defensive alliance (March 1743); but he deprived it of all political significance by excluding from it the proposed guarantee of Frederick's Saxony for quests. Moreover, through Bestuzhev's efforts, the credit of the Prussian king (whom he rightly regarded as more dangerous than France) at the Russian court fell steadily, and the vice-chancellor prepared the way for an alliance with Austria by acceding to the treaty of Breslau (1st of November 1743). A bogus conspiracy, however, got up by the Holstein faction, aided by France and Prussia, who persuaded Elizabeth that the Austrian ambassdor was intriguing to replace Ivan VI. on the throne, alienated the empress from Austria for a time; and Bestuzhev's ruin was regarded as certain when, in 1743, the empress, afoot against, made a pass at Chétardie, and bestirred her other enemies. But he found a friend in need in M. L. Vorontsov, the empress's confidant, who shared his political views. Still his position was most delicate, especially when the betrothal between the grand-duke Peter and Sophia of Anhalt-Zerbst (afterwards Catharine II.) was carried through against his will, and Elizabeth of Holstein, the mother of the bride, arrived in the Prussian interests to spy upon him. Frederick II., conscious of the instability of his French ally, was now eager to contract an offensive alliance with Russia; and the first step to this end was the letter of 25th August in which he wrote to his minister Axel von Mardefeld, "the fate of Prussia and my own house depends." But Bestuzhev succeeded, at last, in convincing the empress that Chétardie was an impudent intriguer, and on the 6th of June 1744, that diplomatist was ordered to quit Russia within twenty-four hours. Five weeks later Bestuzhev was made grand chancellor (July 15th). Before the end of the year Elizabeth of Holstein was also expelled from Russia, and Bestuzhev was supreme.

The attention of European diplomacy at this time was concentrated upon the king of Prussia, whose insatiable acquisitiveness of the two powers manifestly directed against Prussia. In 1747, alliances were also concluded with Denmark and the Porte. At the same time Bestuzhev resisted any rapprochement with France, and severed relations with Sweden on its ingratitude. He was expelled from his post, on the 11th of December 1743, but was soon restored. At the same time Bestuzhev was harpered by the persistent opposition of the vice-chancellor Mikhail Vorontsov, formerly his friend, now his jealous rival, who was secretly supported by Frederick the Great. In 1748, however, he got rid of him by proving to the empress that Vorontsov was in the pay of Prussia. The hour of Bestuzhev's triumph coincided with the peace congress of Aix-la-Chapelle, which altered the whole situation of European politics and introduced fresh combinations, the breaking away of Prussia from France and a rapprochement between England and Prussia, with the inevitable corollary of an alliance between France and the enemies of Prussia. Bestuzhev's violent political prejudices at first prevented him from properly recognizing this change. Passion had always been too large an ingredient in his diplomacy. His Anglomania also misled him. His enemies, headed by his elder brother Mikhail and the vice-chancellor Vorontsov, powerless while his diplomacy was faultless, quickly took advantage of his mistakes. When, on the 16th of January 1756, the Anglo-Prussian, and on the 2nd of May the Franco-Austrian alliances were concluded, Vorontsov advocated the accession of Russia to this latter league. "But," he added, "our influence was now on the wane. The totally unexpected Anglo-Prussian alliance had justified the arguments of his enemies that England was impossible, while his hatred of France prevented him from adopting the only alternative of an alliance with her.

To prevent underground intrigues, Bestuzhev now proposed the creation of a council of ministers, to settle all important
affairs, and at its first session (14th-30th of March) an alliance with Austria, France, and Poland against Frederick II. was proposed, though Bestuzhev opposed any composition with France. He endeavoured to support his falling credit by a secret alliance with the grand-duchess Catherine, whom he proposed to raise to the throne instead of her Holsteine husband, Peter, from whom Bestuzhev expected nothing good either for himself or for Russia. The negotiations were conducted through the Pole Stanislaus Poniatowski. The accession of Russia to the anti-Prussian coalition (1756) was made over his head, and the cowardice and incapacity of Bestuzhev's friend, the Russian commander-in-chief, Stephen Apraksin, after the battle of Rossbach (1757), was made use of by his bitterest enemy, overthrowing the chancellor. His unwillingness to agree to the coalition was magnified into a determination to defeat it, though it is quite obvious that he could only gain by the humiliation of Frederick, and nothing was ever proved against him. Nevertheless he was deprived of the chancellorship and banished to his estate at Goretovo (April 1759), where he remained till the accession of Catharine II., who recalled him to court and created him a field marshal. But he took no leading part in affairs that died only a few days after the 28th of July, 1760, the last of his race.

**BESTUZHEV-RYUMIN,** MIKHAIL PETROVICH, COUNT (1688–1760), Russian diplomatist, elder brother of the foregoing, was educated at Berlin, and was sent by Peter the Great to represent Russia at Copenhagen in 1705. In 1720 he was appointed resident at London at a time when the English court was greatly inflamed against Peter, who was regarded as a dangerous rival in the Baltic; and Bestuzhev was summarily dismissed for protesting against the lately formed Anglo-Swedish alliance. On the conclusion of the peace of Nystad in 1721 he was sent as ambassador to the court of Stockholm. His first official act was the signing of a defensive alliance between Russia and Sweden for twelve years, in 1724. He was successively transferred to Warsaw (1726) and to Berlin (1730), but returned to Stockholm in 1732. How far Bestuzhev was concerned in the murder (June 28th, 1739) of the Swedish diplomatic agent Sinclair in Silesia on his journey home from Constantinople, it is difficult to say. It is certain that Bestuzhev sent information to the court of Sinclair's mission, which was supposed to be hostile to Russia, and even supplied the portrait of the envoy for recognition. The Swedish authorities are unanimous in describing Bestuzhev as the arch-plotter in this miserable affair; yet, while the active agents were banished to Siberia, Bestuzhev was not even censured. The Sinclair murder led ultimately to the Swedish-Russian War of 1741, when Bestuzhev was transferred first to Hamburg and subsequently to Hanover, where he endeavoured to conclude an alliance between Great Britain and Russia. On his return to Russia in 1743, he was made grand marshal, and married Anna, the widow of Paul Yaguzhinsky, Peter the Great's faithful pupil. A few months later his wife was implicated in a bogus conspiracy set up by the French ambassador, the marquis de La Chétardie, to ruin the Bestuzhevs (see BESTUZHEV-RYUMIN, ALEXIUS), and after a public whipping, had her tongue cut out and was banished to Siberia. Thither Bestuzhev had not the manhood to follow her, but went abroad, and subsequently resumed his diplomatic career. His last and most brilliant mission was to Versailles, shortly after the conclusion of the coalition against Frederick the Great, where he cut a great figure. He died at Paris on the 27th February, 1760.

**BET and BETTING** (probably from O. Fr. _abeler_, to instigate, Eng. "abet," i.e. with money). To "bet" is to stake money or something valuable on some future contingency. Betting in some form or other has been in vogue from the earliest days, commencing in the East with royal and noble gamblers, and gradually extending itself westwards and throughout all classes. In all countries where the English tongue is spoken betting is now largely indulged in; and in the United Kingdom it spread to such an extent amongst all grades of society, during the 19th century, that the interference of the legislature was necessary (see GAMING and WAGERING). Bets can, of course, be made on any subject, and are a common method of backing one's opinion or skill, whether at games of cards or in any other connexion; but the commonest form of betting is associated with the turf. In the early days of horse-racing persons who wished to bet often failed to gratify their inclination because of the difficulty of finding a backer, but the advent of the bookmaker, and the professional bookmaker arose. It was perceived that a man laid money against a number of horses, conducting his business on discreet principles, he would in all probability receive enough to pay the bettor who was successful and to leave a surplus for himself; for the "bookmaker," as the professional betting man came to be called, had enormous advantages in his favour. He was presumably shrewd and wary, whereas many of those with whom he deal were precisely the opposite, and benefit arose to him from the mistakes and miscalculations of the public. He takes bets on the horses, and from the innumerable accidents which occur to prevent the winning of any horse, if he carried out the theory of his calling he would so arrange his book, by what is called "betting to figures," that the money he received would be more than he could possibly be called upon to pay. In practice, of course, this often does not happen, because "backers" will sometimes support two or three horses in a race only, and the success of one may result in loss to the bookmaker; but in the long run it has been almost invariably found that the bookmaker grows rich and that the backer of horses loses money. It is the bookmaker who regulates the odds, and this he does, sometimes by anticipating, sometimes by noting the desire of backers to support certain animals. Such things as stable secrets can scarcely be said to exist at the present time; the bookmaker is usually as well able as any one else to estimate the chances of the various horses engaged in races. Notwithstanding that the reports of a trial gallop are of comparatively little value to any except the few persons who know what weights the animals carried when tried, the bookmaker is extraordinarily keen, and frequently successful, in his search for information; and on this the odds depend.

In connection with horse-racing is of two kinds: "post," when wagering does not begin until the numbers of the runners are hoisted on the board; and "ante-post," when wagering opens weeks or months before the event; though of this latter there is far less than was formerly the case, doubtless for the reason that before the introduction of so many new and valuable stakes attention was generally concentrated on a comparatively small number of races. Bets on the Derby, the Oaks and the St Leger were formerly common nearly a year before the running of the races, and a few handicaps, such as the Chester Cup, used to occupy attention months beforehand; the weights, of course, being published at a much longer interval prior to the contest than is at present the rule. As regards ante-post betting, bookmakers have their own ideas as to the relative prospects of the horses entered. A person who wishes to back a horse asks the price, and accepts or declines, as the case may be. If the bet is laid it will probably be quoted in the newspapers, and other persons who propose to wager on the race are so likely to follow suit that it is shrewdly suspected that in not a few cases bets are quoted which never have been laid, in order to induce the backers to speculate. According to the public demand for a horse the odds shorten. If there is little or no money the odds increase, the market being almost entirely regulated by the money; so that if a great many people bet on a certain animal the odds become shorter and shorter, till in many cases instead of laying odds against a horse, the bookmaker comes to take odds, that is, to agree to pay a smaller sum than he would receive from the backer if the animal lost. Post betting is conducted on very much the same principles. When the numbers are
hoisted bookmakers proclaim their readiness to lay or take certain odds, which vary according to the demand for the different animals. Backers are influenced by many considerations: by gossip, by the opinions of writers on racing, and in many cases, unfortunately, by the advice of "tipsters," who by advertisements and circulars profess their ability to indicate winners, a pretence which is obviously absurd, as if these men possessed the knowledge they claim, they would assuredly keep it to themselves and utilize it for their own private purposes.

The specious promises of such men do infinite mischief, as they so often appeal with success to the folly and gullibility of the ignorant, and in recent years the extent to which betting has grown has induced in attempts to check it, by ostensible bookmakers' societies, for the purpose, was formed in England and called the Anti-Gambling League. A bookmaker named Dunn was summoned in 1887 for betting in Tattersall's enclosure, which it was contended contravened the Betting House Act of 1853. This act had been aimed against what were known as "list houses," establishments then kept by bookmakers for betting purposes, and associated with many disgraceful scandals. In the preambles to his bill Lord Cockburn began by remarking that "Whereas a new form of betting has of late sprung up," and the Anti-Gambling League sought to argue that this included a form of betting in which had sprung up late but begun a century was carried on without interference for many generations.

The divisional court of the queen's bench (Howe v. Dunn, 13 T.L.R. 281) held that such betting was an infringement of the act, and that the enclosure was a "place" within the meaning of the act, and had been used by the respondent for the purpose of betting with persons resorting thereto, and that he was liable to be convicted. The case was remitted to the justices, who convicted the defendant. A somewhat similar case was decided on the same day (M'Inroy v. Hilldred, 1887, 13 T.L.R. 283), in which it was held that a professional bookmaker's place known as the "pit heap" at Jarrow, to which the public had access at all times, and made bets with persons assembled there, was properly convicted, and that the "pit heap" itself and the place where he stood were "places" within the meaning of the act.

It was afterwards held by the court of appeal (Powell v. Kempion Park Racecourse Co., Ltd., 1897, 2 Q.B. 242), in an action brought to restrain a racecourse company from opening or keeping an enclosure on a racecourse by allowing it to be used by bookmakers, that the words "other place" must be construed as meaning a defined place, that the user of such a place implied some exclusive right in the user against others, and that the racecourse owners had not been guilty of permitting the enclosure to be used in the manner prohibited by the act of 1853. The decision in Howe v. Dunn was disapproved of; and the House of Lords afterwards affirmed the decision of the court of appeal.

The Street Betting Act 1906 enacted that any person frequenting or loitering in streets or public places for the purpose of bookmaking, or betting, or waging, should be liable on summary conviction, in the case of a first offence, to a fine not exceeding ten pounds, in the case of a second offence, to a fine not exceeding twenty pounds, and in the case of a third or subsequent offence, or in any case where he is proved to have committed the offence of having a betting transaction with a person under the age of sixteen years, to a fine, on conviction on indictment, not exceeding fifty pounds or to imprisonment with or without hard labour for a term not exceeding six months. On summary conviction the fine is a sum not exceeding thirty pounds or imprisonment with or without hard labour for a term not exceeding three months. A wide definition is given to the words "street" and "public place," and racecourses are expressly exempted from the operation of the act.

On all French racecourses (since 1866), as on others nearly everywhere else on the continent, and likewise in the British colonies, a system of betting known as the Pari-Mutuel or Totalizator, is carried on. Rows of offices are established behind or near the stands, on each of which lists are exhibited containing the numbers of the horses that are to run in the coming race. At some of these the minimum wager is five francs, at others ten, twenty, fifty, one hundred, five hundred and in some cases a thousand. The person who proposes to bet goes to the clerk at one of these offices, mentions the number, as indicated on the card, of the horse he wishes to back, and states whether he desires to bet on it to win or for a place only. He receives a voucher for his money. After the race the whole amount collected at the various offices is put together and divided after a percentage has been deducted for the administration and for the poor. As soon as this has been done, the money is divided and the prices to be paid to winners are exhibited on boards. These prices are calculated on a unit of ten francs. Thus, for instance, if the winner is notified as bringing in twenty-five francs, the meaning is that the backer receives his original stake of ten and fifteen in addition, the money being paid immediately by another clerk attached to the office at which the bet was made. The great French municipalities derive considerable revenue in relief of rates from the Pari Mutuels.

In Japan this system was made illegal in 1908.

BETAIN (Oxyurine, Lycine), CH₃NO₃, a substance discovered in the sugar beet (Beta vulgaris) in 1836 by C. Scheibler (Ber., 1836, 2, p. 292). It is also found in cotton seed, in the yolk and in wheat sprouts (E. Schulz and S. Frankurt, Ber., 1893, 26, p. 153). It can be obtained by burning choline with chromic acid (O. Liebreich, Ber., 1869, 2, 13), (CH₃)₂N(OH)·CH₂·CH₂OH → CH₃NO₃ + H₂O; by heating trimethylamine with monochloracetic acid (Liebreich), (CH₃)₂N + CH₂·Cl·COOH = (CH₃)₂N·Cl·CH₂·COOH (betaine hydrochloride); and by heating amino-acetic acid (glycocoll) with methyl iodide in the presence of an alkali (P. Gries, Ber., 1875, 8, p. 1460). It crystalizes from alcohol in large deliquecent crystals; and is readily soluble in water, but insoluble in ether. It is a weak base. As is shown by the various synthesis of the base, it is the methyl hydroxide of dimethylglycoll. This free base readily loses water on heating, and gives an internal anhydride of constitution (CH₃)₂N< O >CH₂·COOH which is the type of the so-called "betaines." These organic betaines are internal anhydrides of carboxylic acids, which contain an ammonium hydroxide group in the α-position. A. Hantsch (Ber., 1886, 19, p. 31) prepared the betaine of nicotinic, picolinic and collidine carboxylic acids from the potassium salts of the acids, by treatment with methyl iodide, followed by moist silver oxide. The reaction may be shown as follows:

\[
\text{CH}_3\text{CH}_2\text{CH}_2\text{OH} + \text{CH}_3\text{NO}_3 + \text{H}_2\text{O} \rightarrow \text{CH}_3\text{H}_2\text{NO}_3 + \text{CH}_3\text{OH}.
\]

The methyl betaine of nicotinic acid is identical with the alkaloid triginealine, which was discovered in 1885 by E. Jahn in the seeds of Trigonella faenzae-graccum (Ber., 1885, 18, p. 2518). It has also been obtained from nicotine by A. Pictet by oxidizing the methyl hydroxide of nicotine with potassium permanganate (Ber., 1897, 30, p. 2117).

Substances closely related to betaine are choline, neurine and muscarine. Choline (bilineurine, sinaline), (Gr. χολή, bile), CH₃NO₃ or HO-CH₂·CH₂·N(CH₃)₂·OH, first isolated by A. Strecker in 1862 (Ann. 123, p. 353: 1876, p. 76), is found in the gums, in brain substance, and in various plant substances, and a complex ester of glycerine with phosphoric acid and the fatty acids. It is also found in combination with sinapic acid in sinapine, the glucoside obtained from white mustard, and can be obtained from this glucoside by hydrolysis with baryta water.

\[
\text{CH}_3\text{H}_2\text{NO}_3 + \text{H}_2\text{O} \rightarrow \text{CH}_3\text{H}_2\text{NO}_3 + \text{CH}_3\text{OH}.
\]

It can be synthetically prepared by the action of trimethylamine on an aqueous solution of ethylene oxide (M. Wurtz, Ann. Suppl., 1868, 6, p. 201). It forms deliquecent crystals of strongly alkaline reaction, and absorbs carbon dioxide from the air. It is not poisonous. By continued boiling of its aqueous solution, it is resolved into glycol and trimethylamine.

Neurine, trimethyl vinyl ammonium hydroxide (Gr. νευρον, nerve), CH₃·CH-·N(CH₃)₂·OH, is a product of the putrefaction of the urine. It may be prepared by the action of moist silver oxalate on ethylene dibromide and trimethylamine.

\[
\text{CH}_3\text{Br} + \text{CH}_3\text{Br} + \text{N(CH}_3)_2 \rightarrow \text{CH}_3\text{Br} + \text{N(CH}_3)_2 + \text{OH}.
\]
It is a crystalline solid, very soluble in water, and is strongly basic and very poisonous. Muscarine, C$_{4}$H$_{9}$NO$_{3}$, is an exceedingly poisonous substance found in many fungi. It may be obtained synthetically by oxidizing choline with dilute nitric acid (O. Schmiedeberg, J. Phys. Chem. 1876, 2, 634). The exact constitution has not yet been definitely determined.

**BETEL NUT.** The name betel is applied to two different plants, which in the East are very closely associated in the purposes to which they are applied. The betel nut is the fruit of the Areca or betel palm, Areca catechu, and the betel leaf is that of the product of the betel vine or pan, Chaslea Betel, a plant allied to that which yields black pepper. The Areca palm is a native of the Malay Peninsula and Islands and is extensively cultivated over large parts of the East, including Ceylon, the Maldives, and Siam, the Malay Archipelago and the Philippine Islands. It is a graceful tree with a straight, slender, unbranched stem reaching 40 or 50 ft. in height and about 1½ ft. in circumference, and bearing a crown of 6–9 very large spreading pinnate fronds. The fruit is about the size of a small hen's egg, and within its fibrous rind is the seed or so-called nut, the albumen of which is very hard and has a prettily mottled grey and brown appearance. The chief purpose for which betel nuts are cultivated and collected is for use as a masticatory—their use in this form being widespread throughout the Malay and Polynesian nations. This habit is an extension of the whole human family indulge in betel chewing. For this use the fruits are annually gathered between the months of August and November, before they are quite ripe, and deprived of their husks. They are prepared by boiling in water, cutting up into slices and drying in the sun, by which treatment the slices assume a dark brown or black colour. When chewed a small piece is wrapped up in a leaf of the betel vine or pan, with a pellet of shell lime or chunam; and in some cases a little cardamom, turmeric or other aromatic is added. The mastication causes a copious flow of saliva of a brick-red colour, which dyes the mouth, lips and gums. The habit hardens the teeth, but it is asserted by those addicted to it that it strengthens the gums, sweetens the breath and stimulates the digestive organs. Among the Orientals betel is offered on ceremonial visits in the same manner as wine is produced on similar occasions by Europeans. Betel nuts are further used as a source of catechu, which is procured by boiling the nuts in water. The water of the first boiling becomes red and thick, and when this is inspissated after the removal of the nuts it forms a catechu of high astrigency and dark colour called in Bombay "Kossa." The nuts are again boiled, and the inspissated juice of the second decoction yields a red-brown colour. Betel nuts have been used by turners for ornamental purposes, and for coat buttons on account of the beauty of their structure. At one time they were supposed to be useful as a vermifuge. The nuts of other species of *Areca* are used by the poorer classes in the East as substitutes for the genuine betel nut. The alkaloid arecaidine, C$_{10}$H$_{14}$N$_{2}$O$_{5}$, occurs in areca or betel nuts, together with three other alkaloids: arecoline, C$_{11}$H$_{13}$NO$_{5}$, guvacine, C$_{8}$H$_{13}$NO$_{7}$, and araceine, C$_{6}$H$_{11}$NO$_{3}$. Arecaidine forms white crystals easily soluble in water, and diffusely soluble in alcohol. Chemically it is methyl-tetrahydro-nicotinic acid. Dehydration results in the formation of "betaine," which is a tetrahydro-trigline (see Betaine). Arecoline is an oil, and the physiological action of the betel nut is alone due to this substance. Chemically it is the methyl ester of arecaidine. Guvacine, named from "gubaee," an Indian designation of the betel palm, forms white crystals. It is a secondary base, but its constitution is uncertain. Arecaine is N-acetylguvacine.

**BETHANY** (mod. el-'Azariyeh), a village nearly 2 m. E.S.E. from Jerusalem, on the eastern slope of the Mount of Olives, 2208 ft. above the sea. It is interesting as the residence of Lazarus and his sisters, and a favourite retreat of Jesus (see especially John xii.), which describes the miracle of the resurrection of Lazarus at this place). From the 4th century down to the time of the Mahommedan invasion several ecclesiastical buildings were erected on the spot, but of these no distinct traces remain. El-'Azariyeh is a poor village of about thirty families, with few marks of antiquity; there is no reason to believe that the houses of Mary and Martha and of Simon the Leper, or the sepulchre of Lazarus, still shown by the monks, have any claim to the names they bear. Another Bethany (with the alternative reading Bethabara) is mentioned in John i. 28, as "beyond Jordan"; it has not been identified.

**BETHEL** (Heb. "House of God"), originally called Luz, an ancient city of Palestine, on the N.W. border of the tribe of Benjamin, 11 m. N. of Jerusalem and nearly 2900 ft. above sea-level. From very early times it was a holy place, a circumstance probably due primarily to a very extraordinary group of boulders and rock-outcrops north of the town. Abraham recognized its sanctity (Gen. xii. 9); Jacob, in ignorance, slept in the sacred enclosure and was granted a vision ("Jacob's Ladder," Gen. xviii). For a while the ark seems to have been deposited here (Judg. ii. 6), and it was a place for consulting the oracle (Judg. xx. 18). At the accession of the northern kingdom under Jeroboam, Bethel became a royal residence and a national shrine (1 Kings xii. 29-31, Amos vii. 13), for which its position at the junction of main roads from N. to S. and E. to W. well fitted it. It was taken from Jeroboam by Abijah, king of Judah (2 Chr. xiii. 15). It seems to have continued to flourish down into the Christian era; remains of its ecclesiastical buildings still exist. The present village, which bears the name of Bethin, occupies about three or four acres, and has a population of 1900.

**BÉTHENCOURT, JEAN DE** (c. 1360–1422), French explorer, belonged to a noble family of Normandy, and held important offices at the court of Charles VI., king of France. His spirit was fired by hearing of the deeds of explorers and adventurers, and having formed a plan to conquer the Canary Islands he raised some money by pledging his Norman estates, and sailed from La Rochelle on the 1st of May 1402 with two ships, commanded by himself and Gadifer de la Salle. He was delayed by a mutiny off the coast of Spain, but reached the island of Lanzarote in July. Unable to carry out his project of conquest, he left his men at the Canaries and went to seek help at the court of Castile. He obtained men and provisions from Henry III. king of Castile, through the good offices of his uncle, Robert de Brancomont, who had considerable influence with Henry; he also received the title of king, and did homage to Henry for his future conquests. Returning to the Canaries in 1404 he found that Gadifer de la Salle had conquered Lanzarote and Fuerteventura, and explored other islands. La Salle, unwilling to accept a position of inferiority, left the Canaries and appealed unsuccessfully for redress at the court of Castile. Béthencourt was unable to complete his work of conquest and exploration. In 1405 he visited Normandy, and returned with fresh colonists who occupied Hierro. In December 1406 he left the islands to the government of his nephew, Maciot de Béthencourt, reserving for himself the royal title and a share in any profits obtained. He returned to Normandy, where he appears to have spent the remainder of his days. He died in 1422, and was buried in the church of Grainville-la-Ténturière. Béthencourt wrote a very untrustworthy account of his "conquest of the Canary Islands," *Le Canarien, livre de la conquête et conversion des Canaries*. This has been published with introduction and notes by G. Gravier (Rouen, 1874), and an English translation was edited by R. H. Major for the Hakluyt Society (London, 1872).

See also CANARY ISLANDS, for the controversy as to the relations between Béthencourt and La Salle.

**BETHESDA** (i.e. "House of Mercy," John v. 2), better perhaps Bethzatha orBethsasa, a pool or public bath in Jerusalem, where miraculous cures were believed to be performed. The following identifications have been suggested: Birkit Isra’l; near St Stephen’s gate; a large cistern, near St Anne’s church; the Twin Pools; north of the Haram (the ancient Temple area); the *Hamamom el-Shifa*, or pool of healing, west of the Haram; the Virgin’s fountain, south of the Haram; and the "Pool of Siloam." Which, if any, of these identifications is correct, it is impossible to say.

**BETHESDA,** an urban district of Carnarvonshire, N. Wales, 5 m. from Bangor, by a branch of the London & North-Western railway. Pop. (1901) 5281. It lies near the lower end of the
fine Nant Ffrancon (valley of the Ogwen stream). The scriptural name is due, as often in Wales, to the village or hamlet taking its title from the Nonconformist church. Here are extensive slate quarries belonging to Llwynhely. A narrow-gauge railway connects these with Port Penrhyn, at the mouth of the stream. Cogid (hemlock, *cicuta*), which admits the entry of vessels of 500 tons to the quay at low water.

**BETH-HORON** ("the place of the hollow way"), the name of two neighbouring villages, upper and lower Beth-horon, on the ascent from the coast plain of Palestine to the high tableland of Benjamin, which was until the 16th century the high road from Jerusalem to the sea. The two towns thus played a conspicuous part in Israelite military history (see Josh. x. 10; 1 Sam. xlii. 18; 1 Kings ix. 17; 1 Mac. iii. 13-24; vii. 39 ff., ix. 30). Josephus (Bell. Jud. ii. 19) tells of the ruff of a Roman army under Cæsarius Gallus in a.d. 66. The Talmud states that many rabbis were born in the place. It is now represented by Beit 'Ur-el-foka and Beit 'Ur-tet-tahta.

**BETHLEHEM** (Heb. "House of Bread," or, according to a more questionable etymology, "of [the god] Lakhmu"), a small town in Palestine, situated on a limestone ridge (2550 ft. above sea-level), 5 m. S. of Jerusalem. The neighbourhood produces wheat, barley, olives and vines in abundance. It was occupied in very early times, though the references in Judges xvii., xix., and Ruth are of doubtful date. It was the early home of David and of Joab (2 Sam. ii. 35). It was fortified by Rehoboam, and in the neighborhood of the city Chimham the valiant Godolaph took refuge (Jer. xii. 17). Micah (v. 2) and other writers speak of it as Bethel-Ephrathah: perhaps Ephrathah was the name of the district. Almost complete obscurity, however, was gathering round it when it became (according to Matt. ii. and Luke ii.) the birthplace of Jesus. The traditional scene of the Nativity, a grotto on the eastern part of the ridge, is alleged to have been desecrated during the reign of Hadrian by a temple of Adonis. In 330 it was enclosed by a basilica built by the orders of the emperor Constantine. This basilica (S. Maria a Præsepio), which is still standing, was restored and added to by Justinian, and converted into a church by the three convents successively erected by the Greek, Latin and Armenian Churches (see de Vogtié, *Les Églises de la Terre Sainte*). Captured by the Crusaders in the 11th century, Bethlehem was made an episcopal see; but the bishopric soon sank to a titular dignity. Beside the grotto of the Nativity other traditional sites are shown within the church, such as the Altar of the Magi, the Tomb of Eusebius, the cave wherein Jerome made his translation of the Bible, &c.

There are several monasteries and convents, and British, French and German schools. The village is well built and comparatively clean. The population (8000) has contained few Moslems since the Moslem quarter was destroyed by Ibrahim Pasha, in revenge for the murder of one of his favourites, after the insurrection of 1834. The carving of crucifixes and other sacred mementoes gives employment to a large proportion of the population. In 1850 a dispute arose between France and Russia, in the name of the Latin and Greek Churches respectively, concerning the possession of the key of the chief door of the basilica, and concerning the right to place a silver star, with the arms of France, in the grotto of the Nativity. The Porte, after much futile temporising, yielded to France. This disappointment thus inflicted on Russia was a determining cause of the outbreak of the Crimean War (see Kinglake, *Rèvolution of the Crimea*, chap. iii.). [There is a tiny village of the same name in Zebulun, 7 m. N.W. of Nazareth (Jos. xv. 19).]

See bibliography under PALESTINE. For the modern town see Palmer, *Das jetzige Bethlehem,* in the *Zeitschrift der Deutsch Palästina-Verein,* xvii. p. 89. (R. A. S. M.)

**BETHLEHEM** (1:18:1-20:29), prince of Transylvania, the most famous representative of the Íkteri branch of a very ancient Hungarian family, was born at Ilyé, and educated at Szarhey, at the castle of his uncle Andras Lázár. Thence he was sent to the court of Prince Zsigmond Báthory, whom he accompanied on his famous Wallachian campaign in 1600. Subsequently he assisted Stephen Bocskay to mount the throne of Transylvania (1603), and remained his chief councillor. He also supported Bocskay in his battles with Gabriel Báthory (1608-1613), but the prince became jealous of Bethlen's superior abilities, and he was obliged to take refuge with the Turks.

**BETHLEN, GABRIEL (Gábor) (1580-1629), prince of Transylvania,** the most famous representative of the Íkteri branch of a very ancient Hungarian family, was born at Ilyé, and educated at Szarhey, at the castle of his uncle Andras Lázár. Thence he was sent to the court of Prince Zsigmond Báthory, whom he accompanied on his famous Wallachian campaign in 1600. Subsequently he assisted Stephen Bocskay to mount the throne of Transylvania (1603), and remained his chief councillor. He also supported Bocskay in his battles with Gabriel Báthory (1608-1613), but the prince became jealous of Bethlen's superior abilities, and he was obliged to take refuge with the Turks.
In 1613 he led a large army against his persecutor, on whose murder by two of his officers that year Bethlen was placed on the throne by the Porte, in opposition to the wishes of the emperor, who preferred a prince who would incline more towards Vienna than towards Constantiopolis. On the 13th of October 1613, the diet of Klaussen passed under the chair of the elector. In 1614 Bethlen was also officially recognized by the emperor Matthias. Bethlen no sooner felt firmly seated on his throne than he seized the opportunity presented to him by the outbreak of the Thirty Years' War to take up arms in defence of the liberties and the constitution of the extra-Transylvanian Hungarian provinces, with the view of more effectually assuring his own position. While Ferdinand was occupied with the Bohemian rebels, Bethlen led his armies into Hungary (1619), and soon won over the whole of the northern counties, even securing Pressburg and the Holy Roman province. Nevertheless he was not averse to a peace, nor to a preliminary suspension of hostilities, and negotiations were opened at Presburg, Kassa and Besztercebanya successively, but came to nothing because Bethlen insisted on including the Bohemians in the peace, whereupon (20th of August 1620) the estates of North Hungary elected him king. Bethlen accepted the title but refused to be crowned, and war was resumed, till the defeat of the Czechs at the battle of the White Hill gave a new turn to affairs. In Bohemia, Ferdinand II. took a fearful revenge upon the vanquished; and Bethlen, regarding a continuation of the war as unprofitable, concluded the Peace of Cateztin (3ist Dec. 1626), by which he renounced the royal title on condition that Ferdinand confirmed the peace of Vienna (which had granted full liberty of worship to the Protestants) and engaged to summon a general diet within six months. For himself Bethlen secured the title of prince of the Empire, the seven counties of the Upper Theiss, and the fortresses of Tokaj, Munkacs and Esced. Subsequently Bethlen twice (1623 and 1626) took up arms against Ferdinand as the ally of the anti-Habsburg Protestant powers. The first war was concluded by the peace of Vienna, the second by the peace of Pressburg, both confirmatory of the peace of Nikolsburg. After the second of these insurrections, Bethlen attempted a rapprochement with the court of Vienna on the basis of an alliance against the Turks and his own marriage with one of the Austrian archduchesses; but Ferdinand had no confidence in him and rejected his overtures. Bethlen was obliged to renounce his anti-Turkish projects, which he had hitherto cherished as the great aim and object of his life, and continue in the old beaten paths. Accordingly, on his return from Vienna he wedded Catherine, the daughter of the elector of Brandenburg, and still more closely allied himself with the Protestant powers, especially with Gustavus Adolphus of Sweden, who helped him. Thus he would assist him to obtain the Polish crown. He died before he could accomplish any of his great designs (15th of November 1629), having previously secured the election of his wife Catherine as princess. His first wife, Susannah Károlyi, died in 1622.

Gabriel Bethlen was certainly one of the most striking and original personages of his century. A zealous Calvinist, whose boast it was that he had read the Bible twenty-five times, he was nevertheless no persecutor, and even helped the Jesuit Kaldy to translate and print his version of the Scriptures. He was the author of some of his life consisting of valuable statements, so that his correspondence is one of the most interesting and important of historical documents. He also composed hymns.

The best editions of his correspondence are those by Sándor Szigályi, both published at Buda (1866 and 1879). The best life of him is that by his disciple the historian Antóny Jónyely, of the group of Hungarian historians (Budapest, 1842). This work has been largely utilized by Ignác-Acsády in his excellent Gabriel Bethlen and his Court (Hun., Budapest, 1890). (R. N. B.)

BETHNAL GREEN, an eastern metropolitan borough of London, England, bounded N. by Hackney, E. by Poplar, S. by Stepney and W. by Shoreditch. Pop. (1901) 129,580. It is a district of poor houses, forming part of the area commonly known as the "East End." The working population is employed in the making of match-boxes, boot-making, cabinet-making and other industries; but was formerly largely devoted to silk-weaving, which spread over the district from its centre in Spitalfields (see Stepney). This industry is still maintained. The Bethnal Green museum was opened in 1872. It contains exhibits of food and animal products, formerly at South Kensington, assembled from various sources. Many of the exhibits are held from time to time. The Museum has also housed the Wallace collection until the opening of Hertford House, and the pictures now in the National Portrait Gallery. It stands in public gardens; there are several other small open spaces; and some 70 out of the 217 acres of Victoria Park are within the borough. Close by the park there stood, until the 19th century, a house believed to have belonged to the notorious Bishop Bonner, the persecutor of Protestants in the reign of Mary; his name is still attached to a street here. Among institutions are the missionary settlement of the Oriental Home family in 1880, with its women's branch, St Margaret's House; the North-Eastern hospital for children, the Craft school and the Leather Trade school. The parliamentary borough of Bethnal Green has two divisions, each returning one member. The borough council consists of a mayor, 5 aldermen and 30 councillors.

BÉTHUNE (Family). The seigneurs of Béthune, avoués (advocats) of the great abbey of Saint-Vaast at Arras from the 11th century, were the ancestors of a great French house whence sprang the dukes of Sully, Charost, Orval, and Ancenis. The first to be elected elector of Rosny, Charost, and Chabris; the counts of Selles and the princes of Boisbelle and Henrichemont. Conon de Béthune (q.v.), the crusader and poet, was an early forebear. The most illustrious member of the Béthune family was Maximilian, baron of Rosny, and afterwards duke of Sully (q.v.), minister of Henry IV. His brother Philip, count of Selles and of Charost, was ambassador to Scotland, Rome, Savoy and Germany, and died in 1649. Hippolyte de Béthune, count of Selles and marquis of Chabris, who died in 1665, bequeathed to the king a magnificent collection of historical documents and works of art. The Charost branch of the family gave France a number of generals during the 17th and 18th centuries.

The last duke of Charost, Armand Joseph de Béthune (1738–1800), French economist and philanthropist, served in the army during the Seven Years' War, after which he retired to his estates in Berry, where, and also in Brittany and Picardy, he sought to ameliorate the lot of his peasants by abolishing feudal dues, and introducing reforms in agriculture. During the Terror he was arrested, but was liberated after the 9th Thermidor. He was mayor of the 10th arrondissement of Paris under the Consulate, and died at Paris on the 27th of October 1841, at the age of 80. He is remembered for a workshop for the blind which he had founded. He published essays on the way to destroy mendicancy and to improve the condition of the labourers, and also on the establishment of a fund for rural relief and the organization of rural education. His life throws light on some phases of the ancien régime which are often overlooked by historians. Louis XV. said of Charost, "Look at this man, his appearance is insignificant, but he has put new life into three of my provinces." His only son, Armand Louis de Béthune, marquis de Charost, was beheaded on the 28th of October 1801, and his son was guillotined on the 30th of October 1830.

BÉTHUNE, CONON or QUEENES, DE (c. 1150–1224), French trouvère of Arras, was born about the middle of the 12th century. He came about 1180 to the court of France, where he met Marie de France, countess of Champagne. To this princess his love poems are dedicated, and much of his time was passed at her court where the trouvères were held in high honour. At the French court he met with some criticisms from Queen Alix, the widow of Louis VII., on the roughness of his verse and on his Picard dialect. To these criticisms, interesting as proof of the already preponderant influence of the dialect of the Île-de-France, the poet replied by some verses in the satirical vein that best suited his temperament. Some of his best songs were inspired by anger at the delays before the crusade of 1188–1192. His plain-speaking made him many enemies, and when he returned
with the rest after the fruitless capture of Acre, these were not slow to take advantage of the opportunity for retaliation. Clay took part with Baldwin of Flanders in the crusade which resulted in 1204 in the capture of Constantinople, and he is said to have been the first to plant the crusaders' standard on the walls of the city. He held high office in the new empire and died about 1224. His verses, of which the crusading song *Achk amors com dure départie* is well known, are marked by a vigour and martial spirit which distinguish them from the work of other trouvères.

The complete edition of his works is in the *Trouvères belges de l'Ancien temps* of Aug. Scheler (1876).

**BÉTHUNE**, a town of northern France, capital of an arrondissement in the department of Pas-de-Calais, 24 m. N.N.W. of Arras, on the Northern railway between that town and St. Omer. Pop. (1900) 12,601. Béthune is situated on a low hill at the confluence of the Lave with the canal from Aire to Bâuvin. Once strongly fortified, it is now surrounded by wide boulevards, and new quarters have grown up on its outskirts. The old town is composed of winding streets and _culs-de-sac_ bordered by old houses in the Flemish style. In the central square stands one of the finest belfries of northern France, partly surrounded by a wooden gallery, and dating from the 14th century. St. Vaast, the principal church of Béthune, belongs to the 16th century. The town is the seat of a sub-prefecture, and has a tribunal of first instance, a chamber of commerce and a communal college among its public institutions. Béthune lies in the midst of the richest coal mines in France. Its industries include the distillation of oil, tanning, salt-refining, brewing, and the manufacture of earthenware and earthenware and glass. Trade is carried on in flax, cloth, cereals, oilseeds, &c.

The town, which dates from the 11th century, was governed by its own lords till 1248, after which date it passed through the ownership of the counts of Flanders, the dukes of Burgundy, and the sovereigns of Austria and Spain. Ceded to France by the peace of Nijmegen (1678), it was taken by the allied forces in 1710, and restored to France by the treaty of Utrecht.

**Betrothal** (A.S. _treowth_, "truth"), the giving "one's truth," or pledging one's faith to marry. Although left optional by the church and not necessary in law, betrothal was anciently a formal ceremony which in most cases preceded the actual marriage service, usually by a period of some weeks, but the marriage service could be held immediately. The canon law distinguished two types of betrothal: (1) *Sponsalia de praesenti*, (2) *Sponsalia de futuro*. The first was a true though irregular marriage, and was abolished by the council of Trent as leading to clandestine unions and therefore being inimical to morality. The second, or betrothal properly so called, was a promise to marry at a future date, which promise without further ceremony became a valid marriage upon consummation. The church never precisely determined the form of the ceremony, but demanded for its validity that it should have been entered into freely and at a legal age, i.e. after the seventh birthday. The church further declared that females between the ages of seven and twelve, and males between seven and fourteen, could be betrothed, but not married, and that all such betrothals were to be public. The ill-defined laws as to betrothals tended to encourage abuses; and the people, especially in the rural districts, inclined to hold betrothal sufficient justification for cohabitation. Such pre-contract is known to have existed in the case of Shakespeare (q.v.). Francis Douce (Illustrations of Shakespeare and of Antient Manners, 1807) says that betrothal consisted of the "interchange of rings—the kiss—the parting of hands, in order to be added the testimony of witnesses." In France the presence of a priest seems to have been considered essential, and though this was not so elsewhere it was customary for the couple to get their parish priest to witness their promise. In England solemn betrothal was almost universally practised. Among the peasantry the place of rings was taken by a coin which was broken between the pair, each taking a part. But almost any gift sufficed. A case in 1582 is recorded where the lover gave the girl a pair of gloves, two oranges, "two handkerchiefs and a red silk girdle. Sometimes the bride-elect received a bent or crooked sixpence. At the ceremony of the church in which by no means always took place in a church, it seems to have been usual for the couple to pledge each other in a cup of wine, as do the Jews and Russians to-day. This drinking together was ever the universal custom of parties in ratification of a bargain. Joseph Strutt (1749-1802) states that by the civil law gifts given at betrothal could be recovered by the parties, if the marriage did not take place. But only conditionally, for if the man "had had a kiss for his money, he should lose one half of that which he gave. Yet with which man it is otherwise, for, kissing or not kissing, whatever her partner may have given her, she is entitled to nothing but the return only to gloves, rings, bracelets and such-like small wares."

Though the church abstained from prescribing the form of the ceremony, it jealously watched over the fulfilment of such contracts and punished their violation. Betrothal, validly contracted, could be dissolved either by mutual consent, or by the supervening of some radical physical or social change in the parties, or by the omission to fulfil one of the conditions of the contract. But here the church stepped in, and endeavoured to re-form the betrothal, refused to marry in *facie ecclesiae* who was liable to excommunication till relieved by public penance. In England the law was settled by an act of 1753, which enacted that an aggrieved party could obtain redress only by an action at common law for breach of promise of marriage (see MARRIAGE).

Formal betrothal is no longer customary in England, but on the European continent it retains much of its former importance. There it is either solemn (publicly in church) or private (simply before witnesses). Such betrothals are legal contracts. They are only valid between persons of legal age, both of whom consent; and they are rendered void by fraud, intimidation and duress. In Germany if the parties are under age the consent of the parents is needed; but if this be unreasonably withheld the couple may appeal to a magistrate, who can sanction the betrothal. If the parents disagree, the father's wish prevails. Public betrothal carries with it an obligation to marry, and in case of refusal an action "lies" for the injured party. In Germany the betrothal is generally celebrated before the relatives, and the couple are called bride and bridgroom from that day until marriage.

In Russia, where it was once as binding as marriage, it is now a mere formal part of the marriage ceremony (see MARRIAGE). Among the ancient Jews betrothal was formal and as binding as marriage. After the ceremony, which consisted of the handing of a ring or some object of value to the bride and formal words of contract, and the mutual pledging of the couple in consecrated wine, a period of twelve months elapsed before the marriage was completed by the formal home-taking; unless the bride was a widow or the groom a widower, when this interval was reduced to thirty days. Latterly the ceremony of betrothal has become a part of the marriage ceremony, and the engagement has become the informal affair it is in England.

**Betterment** (i.e., "making better," as opposed to "worsement"), a general term, used particularly in connexion with the increased value given to real property by causes for which a tenant or the public are not the owners, is the nature of "unearned increment." When, for instance, some public improvement results in raising the value of a piece of private land, and the owner is thereby "bettered" through no merit of his own, he gains by the betterment, and many economists and politicians have sought to arrange, by taxation or otherwise, that the increased value shall come into the pocket of the public rather than into his. A betterment tax would be so assessed as to divert from the owner of the property the profit
BETTERTON—BETTY

thus accruing "unearned" to him. (See also Compensation.)
The whole problem is one of the incidence of taxation and the
demand of land values, and various applications of the principle of
betterment have been tried in America and in England,
raising considerable controversy from time to time.

See A. A. Baumann, Betterment, Wrorsement and Recoupmcnt
(1894).

BETTERTON, Thomas (c. 1635-1710), English actor, son of
an under-cook to King Charles I., was born in London. He
was apprenticed to John Holden, Sir William Davenant's publisher,
and possibly later to a bookseller named Rhodes, who had been
wardrobe-keeper to the theatre in Blackfriars. The latter
obtained in 1662 a licence to set up a company of players at the
Cockpit, in Drury Lane; and on the reopening of this theatre in
1666, Betterton made his first appearance on the stage.
His talents at once brought him into prominence, and he was
giving leading parts. On the opening of the new theatre in Lincoln's
Inn Fields in 1661, Sir William Davenant, the patentee, engaged
Betterton and all Rhodes's company to play in his Siege of
Rhodes. Betterton, besides being a public favourite, was held
in high esteem by Charles II., who sent him to Paris to examine
stage improvements there. According to Cibber it was after his
return, yet their conceit was increased instead of diminished. There
were several applications of the principle of
an English theatre. In 1662, in an unfortunate speculation, Betterton
and his friend Sir Francis Watson were ruined; but
Betterton's affection for Sir Francis was so strong that he adopted
the latter's daughter and educated her for the stage.
In 1693, with the aid of friends, he erected the New Playhouse in
the tennis court in Lincoln's Inn Fields. It was opened in 1695
with Congreve's Love for Love. But in a few years the profits
fell off; and Betterton, labouring under the infirmities of age
and gout, determined to quit the stage. At his benefit performance,
when the profits are said to have been over £500, he played Valentine in Love for Love.
In 1710 he made his last appearance as Melancthius in The Maid's Tragedy; he died on the 28th of
April, and was buried in Westminster Abbey.

In appearance he was athletic, slightly above middle height, with a tendency to stoutness; his voice was strong rather than
melodious, but in recitation it was used with the greatest dexterity.
Pepys, Pope, Steele and Cibber all bestow lavish praise on his
acting. His repertory included a large number of Shake-
Spearian roles, and although many of these were presented in the
tasteless versions of Davenant, Dryden, Shadwell and Nahum Tate,
when he could not find in the comic scenes in which
Betterton possessed, nor does his reputation rest on these
performances alone. The blamelessness of his life was
spurious in a court and a profession notorious for dissolute
habits. Betterton was author of several adaptations which were
popular in their day. In 1662 he had married Mary Saund-
derson (d. 1712), an admirable actress, whose Ophelia shared
the honours with his Hamlet.

See Howe, Thomas Betterton (1891); The Life and Times of Thomas
Betterton (1896).

BETTA, a town of British India, in the Chamarpan district
of Bengal; situated on a former branch of the Harua river,
with a station on the Tirhoot section of the Bengal & North-
Western railway. Betta is the residence of the leading
noblemen of northern Behar, who enjoys a rent-roll of £60,000.
In 1901, owing to a disputed succession, the estate was under
the management of the court of wards. It comprises land in
no fewer than ten districts, much of which is let on permanent
leases to indigo-planters. Besides the palace of the maharaja,
the town contains a middle English school and a female des-
partment, entirely supported out of the estate. There is a Roman
Catholic mission, with about 1000 converts, which was founded
by an Italian priest in 1746.

BETTINELLI, Saverio (1718-1808), Italian Jesuit and man of
letters, was born at Mantua on the 18th of July 1718. After
studying under the Jesuits in his native city and at Bologna he
entered the society in 1736. He taught the belles-lettres
from 1739 to 1744 at Brescia, where Cardinal Quirini, Count
Mazzucchelli, Count Duranti and other scholars, formed an illus-
rious academy. He next went to Bologna, to pursue the study of
classics, and then, he enjoyed the society of many learned
and literary men. At the age of thirty he went to Venice,
where he became professor of rhetoric, and was on friendly terms
with the most illustrious persons of that city and state.
The superintendence of the college of nobles at Parma was entrusted
"to him in 1751; and he had principal charge of the studies of
poetry and history, and the entertainments of the theatre. He
remained there eight years, visiting, at intervals, other cities
of Italy, either on the affairs of his order, for pleasure or for
health. In 1755 he traversed part of Germany, proceeded
as far as Strassburg and Nancy, and returned by way of
Rouen to Bologna, where he settled, and went into an
affair of his order, for pleasure. He died in Venice on the 27th of
July 1791, leaving a numerous correspondence.

BETTYS Y COED, an urban district of Carnarvonshire, North
Wales, 4 m. from Llanrwst and 16 m. from Llandudno, on a branch
of the London & North-Western railway. Pop. (1901) 1700.
The name means "warm place of the wood," according to Llyn's
definition of beths. The other derivation of the word from
Abbatis (domus) agrees with its vicinity to Ysbytyll 1Han (Ieuan),
Hospiwm Ioannis, near Penrelo Fochas. The words "y coed"
are added to distinguish this Betts from several others in Wales,
especially that near Llandeilo Fawr, Carmarthenshire, not far
from the Bettws hills. Betws y coed is a favourite village
for artists and tourists. It is a centre for excursions towards Capel
Curig and Snowdon, or towards Blaenau Ffestinhog, via Roman
Bridge. There is excellent fishing for salmon and trout, and in
summer coaches leave their daily loads of tourists here.
The best-known streams and waterfalls are Llugwy, Lledr, with
Rhaeadr y Wenol (Swallow falls), Conwy and Machno falls.
In the neighbourhood are Dolwyddelan castle and the hill of Moel
Siabod.

BETTY, WILLIAM HENRY WEST (1791-1874), English
actor, known as "the young Roscius," was born on the 13th of
September 1791 at Shrewsbury. He first appeared on the stage
at Belfast before he was twelve years old, as Osman in Arow
Hill's Zara, an English version of Voltaire's Zaire. His success
was immediate, and he shortly afterwards appeared in Dublin,
where it is said that in three hours of study he committed the
1 Other places named "Ysbytyll" are Y. Cynfyn and Y. Ystwyth.
For the name Ysbytyill, cf. Bale's King John, 2125: "So many
maseendens (maisons Dieu), hospitalls and spytly howses."
part of Hamlet to memory. His precocious talents aroused great enthusiasm in Glasgow and Edinburgh, and he was favourably compared with some of the greatest tragedians. In 1804 he first appeared at Covent Garden, when the troops had to be called out to preserve order, so great was the crush to obtain admittance. At Drury Lane the house was similarly packed, and he played for the then unprecedented salary of over 75 guineas a night. He was a great success socially, George III. himself presenting him to the queen, and Pitt upon one occasion adjoining the House of Commons that members might be in time for his performance. But this enthusiasm gradually subsided, and in 1808 he made his final appearance as a boy actor, and entered 008. The first dislike he had excited was the general found in the capital, but the public would have none of him, and he retired to the enjoyment of the large fortune which he had amassed as a prodigy. He died on the 24th of August 1874. His son Henry Betty (1819–1897) was also an actor.

BETUL, a town and district of British India, in the Nerbudda division of the Central Provinces. In 1901 the population of the town was 4739. The administrative headquarters of the district have been transferred to the town of Badnur (q.v.), 3 m. north.

The district of Betul has an area of 3836 sq. m. In 1901 the population was 85,363, showing a decrease of 2.7% in the decade, due to emigration, pulse, oil-seeds, and a little sugar-cane and cotton. The sea is about 2000 ft. The country is essentially a highland tract, divided naturally into three distinct portions, differing in their superficial aspects, the character of their soil and their geological formation. The northern part of the district forms an irregular plain of the sandstone formation. It is a well-wooded tract, in many places stretching out in charming glades like an English park, but it has a very sparse population and little cultivated land. In the extreme north a line of hills rises abruptly out of the great plain of the Nerbudda valley. The central tract alone possesses a rich soil, well watered by the Machna and Sampa rivers, almost entirely cultivated and studded with villages. To the south lies a rolling plateau of basaltic formation (with the sacred town of Multai, and the springs of the river Tapti at its highest point), extending over the whole of the southern face of the district, and finally merging into the wild and broken line of the Ghatis, which lead down to the plains. This tract consists of a succession of stony ridges of trap rock, enclosing valleys or basins of fertile soil, to which cultivation is for the most part confined, except where the shallow soil on the tops of the hills has been turned to account. The principal crops are wheat, millet, other food results of family, and sugar-cane. A large part of the area is covered with forests, which yield teak and other timber. The only manufacture is cotton cloth. A railway is projected from Itarsi through the district to Berar. Good roads are few; and none of the rivers is navigable. This district suffered very severely from the famine of 1866–1867, in 1897 the death-rate being as high as 73 per 1000. It suffered again in 1900, when in May the number of persons relieved rose to one-third of the total population.

Little is known of the early history of the district except that it must have been well settled before the first of the four great Gond kingdoms of Kherla, Deoghar, Mahdia, and Chanda. According to Ferishta, the Persian historian, these kingdoms engaged in 1398 all the hills of Gondwana and adjacent countries, and were of great wealth and power. About the year 1418 Sultan Husain Shah of Malwa invaded Kherla, and reduced it to a dependency. Nine years later the raja rebelled, but although with the help of the Bahmani kings of the Deccan he managed for a time to assert his independence, he was finally subdued and deprived of his territories. In 1497 Kherla was seized by the Bahmani king, but was afterwards restored to Malwa. A century later the kingdom of Malwa became incorporated into the dominions of the emperor of Delhi. In 1703 a Mysulman convert of the Gond tribe held the country, and in 1743 Raghooji Bhonsla, the Mahatta ruler of Baran, annexed it to his dominions. The Maharratas in the year 1818 ceded this district to the East India Company as payment for a contingent, and by the treaty of 1818 it was formally incorporated with the British possessions.

Detachments of British troops were stationed at Multai, Betul and Shahpur to cut off the retreat of Apa Sahib, the Mahatta general, and a military force was quartered at Betul until June 1819. The town was garrisoned by the garrison of government under the Gonds and preceding rulers, and hence the district was, until the time of its annexation to the British dominions, known as the “Kherla Sarkar.” The town of Multai contains an artificial tank, from the centre of which the Tapti is said to take its rise; hence the reputed sanctity of the spot, and the accumulation of temples in its honour.

The climate of Betul is fairly healthy. Its height above the plains and the neighbourhood of extensive forests moderate the heat, and render the temperature pleasant throughout the greater part of the year. During the cold season the thermometer at night falls below the freezing point; little or no hot wind is felt before the end of April, and even then it ceases after sunset. The nights in the hot season are comparatively cool and pleasant. During the monsoon the climate is very damp, and at times even cold and raw, thick clouds and mist enveloping the sky for many days together. The average annual rainfall is 40 in. In the denser jungles malaria prevails for months after the cessation of the rains, but the Gonds do not appear to suffer much from its effects. Travellers and strangers who venture into these jungles run the risk of fever of a severe type at almost all seasons of the year.

BETWA, a river of India, which rises in the native state of Bhopal in Malwa, and after a course of 360 m., for the most part in a north-easterly direction, falls into the Jumna at Hamirpur. A weir is thrown across the Betwa about 15 m. from Jhanai town, whence a channel 168 m. long takes off, irrigating 106,000 acres of the Jalaun district; similar works have been carried out elsewhere on the river.

BEUDANT, FRANÇOIS SULPICE (1787–1856). French mineralogist and geologist, was born at Paris on the 5th of September 1787. He was educated at the École Polytechnique and École Normale, and in 1811 was appointed professor of mathematics at the lycée of Avignon. Thence he was called, in 1813, to the lycée of Marseilles to fill the post of professor of physics. In the following year the royal mineralogical cabinet was committed to his charge to be conveyed into England, and from that time his attention was directed principally towards geology and cognate sciences. In 1817 he published a paper on the phenomena of crystallization, treating especially of the variety of forms assumed by the same mineral substance. In 1818 he undertook, at the request of the French government, a geological journey through Hungary, and the results of his researches, Voyage minéralogique et géologique en Hongrie, 3 vols. 4to, with atlas, published in 1822, established for him a European reputation. In 1820 he was appointed to the professorship of mineralogy in the Paris faculty of sciences, and afterwards became inspector-general of the university. He subsequently published treatises on physics and on mineralogy and geology, and died on the 10th of December 1856.

BEUGNOT, JACQUES CLAUDE, COUNT (1761–1833). French politician, was born at Bar-sur-Aube. A magistrate under the old régime, he was elected deputy to the Legislative Assembly (1791), then to the Convention. He was involved in the proscription of the Girondists and imprisoned until the 9th Thermidor. He next entered into relations with the family of Bonaparte, and in 1799, after the 18th Brumaire, again entered politics, becoming successively prefect of the lower Seine, councillor of state, and finance minister to Jerome Bonaparte, king of Westphalia. In 1808 Beugnot, who had meanwhile been appointed administrator of the duchy of Berg-Cleves, received the cross of officer of the Legion of Honour with the title of count. He returned to France in 1813, after the battle of Leipzig, and was made prefect of the department of Nord. In 1814 he was a member of the provisional government as minister of the interior; and by Louis XVIII. he was named director-general of police and afterwards minister of marine. He followed Louis to Ghent during the Hundred Days, and became
one of his confidants. He contributed to draw up Louis's charter, and in his memoirs boasted of having furnished the text of the proclamation addressed by the king to the French people before his return to France; but it is known now that it was another man who was that was adopted. Lacking the support of the ultra-royalists, he was given the title of minister of state without portfolio, which was equivalent to a retirement. Elected deputy, he attached himself to the moderate party, and defended the liberty of the press. 

In 1833 Louis Philippe made him a peer of France and director-general of manufactures and commerce. He died on the 24th of June 1835.

His son, Auguste Arthur Beugnot (1797–1865), was an historian and scholar, who published an Essai sur les institutions de Saint-Louis (1821), Histoire de la destruction des œuvres en occident (2 vols., 1835), and edited the Olim of the parlement of Paris, the Assises of Jerusalem, and the Coutumes de Beauvoisins of Philippe de Beaumanoir. He was a member of the chamber of peers under Louis Philippe, and opposed Villemain's plan for freedom of education. After 1848 he maintained the same rôles, acting as reporter of the loi Folloux. He retired from public life after the coup d'état of Napoleon III., and died on the 15th of March 1865.

The Mémoires de J. C. Beugnot were published by his grandson, Count Albert Beugnot (2nd ed., Paris, 1868); see H. Wallon, Études académiques (1862); and E. Dejean, Un Préfet du Consulat: J. C. Beugnot (Paris, 1907).

BEULÉ, CHARLES ERNEST (1826–1874). French archaeologist and politician, was born at Saumur on the 29th of June 1826. He was educated at the École Normale, and after having held the professorship of rhetoric at Moulins for a year, was sent to Athens in 1851 as one of the professors in the École Française there. He had the good fortune to discover the propylaea of the Acropolis, and his work, L'Acréopolé d'Athènes (2nd ed., 1863), was published by order of the minister of public instruction. On his return to France, promotion and distinction came to him rapidly; he was made doctor of letters, chevalier of the Legion of Honour, professor of archaeology at the Bibliothèque Impériale, member of the Académie des Inscriptions et Belles-Lettres and perpetual secretary of the Académie des Beaux-Arts. He took great interest in political affairs, with which the last few years of his life were entirely occupied. Elected a member of the National Assembly in 1871, he zealously supported the Orleanist party. In May–November 1873 he was minister of the interior in the Broglie ministry. He died by his own hand on the 4th of April 1874. His other important works were: Études sur la Péloponnèse (1st ed., 1872); Les Monnaies d'Athènes (1868); L'Architecture de la vallée de Pinistrate (1860); Fouilles à Carthage (1861). Beulé was also the author of high-class popular works on artistic and historical subjects: Histoire de l'art grec avant Pélerîmes (2nd ed., 1870); Le Procès des Césars (1867–1870, in four parts; Auguste, sa famille et ses amis; Thèbes et l'hérésie d'Auguste; Le Sang de Germanicus; Titus et sa dynastie).

See Ideville, Monseur Beulé, Souvenirs personnels (1874).

BEURNONVILLE, PIERRE DE RUEL, MARQUIS DE (1752–1821), French general. After service in the colonies, he married a woman in his first successes, and returning to France purchased the post of lieutenant of the Swiss guard of the count of Provence. During the Revolution he was named lieutenant-general, and took an active part in the battles of Valmy and Jemmapes. Minister of war in February 1793, he denounced his old commander, C. F. Dumouriez, to the Convention, and was one of the four deputies sent to watch him. Given over by him to the Austrians on the 3rd of April 1793, Beurnonville was not exchanged until November 1795. He entered the service again, commanded the armies of the Sambre-et-Meuse and of the North, and was appointed inspector of infantry of the army of England in 1796. In 1798 he was sent as ambassador to Berlin, in 1802 to Madrid. Napoleon made him a senator and count of the empire. In 1814 he was a member of the provisional government organized after the abdication of Napoleon, and was created a peer of France. During the Hundred Days he followed Louis XVIII. to Ghent, and after the second restoration was made marquis and marshal of France.

BEUST, FRIEDRICH FERDINAND VON (1829–1886). Austrian statesman, was descended from a noble family which had originally sprung from the Mark of Brandenburg, and of which one branch had been for over 300 years settled in Saxony. He was born on the 13th of January 1809 in Dresden, where his father held office at the Saxony court. After studying at Leipzig and Göttingen he entered the Saxony public service; in 1836 he was made secretary of legation at Berlin, and afterwards held appointments at Paris, Munich and London. In March 1848 he was summoned to Dresden to take the office of foreign minister, but in consequence of the outbreak of the revolution he was justified. In 1849 he was appointed to the function of foreign minister in Dresden, and in February 1849 was again summoned to Dresden, and this time appointed minister of foreign affairs, an office which he continued to hold till 1866. In addition to this he held the ministry of education and public worship from 1849 to 1853; that of internal affairs in 1853, and in the same year was appointed minister-president. From the time that he entered the ministry he was, however, the leading member of it, and he was chiefly responsible for the events of 1849. By his advice the king refused to accept the constitution proclaimed by the Frankfort parliament, a policy which led to the outbreak of revolution there. In December 1853 he was in Dresden, where he was busy through Prussian troops, for whose assistance Beust had asked. On Beust fell also the chief responsibility for governing the country after order was restored, and he was the author of the so-called coup d'état of June 1850 by which the new constitution was overthrown. The vigour he showed in repressing all resistance to the government, especially that of the university, and in reorganizing the police, made him one of the most unpopular men among the Liberals, and his name became synonymous with the worst form of reaction, but it is not clear that the attacks on him and his colleagues were deserved. In 1859 he was asked by the king to resign, and he soon became one of the most conspicuous figures in German politics. He was the leader of that party which hoped to maintain the independence of the smaller states, and was the opponent of all attempts on the part of Prussia to attract them into a separate union; in 1849–1850 he had been obliged to join the "three kings' union" of Prussia, Hanover and Saxony, but he was careful to keep open a loophole for withdrawal, of which he speedily availed himself. In the crisis of 1851 Saxony was on the side of Austria, and he supported the restoration of the diet of the confederation. After the war of 1866 he took part in the Bamberg conferences, in which the smaller German states claimed the right to direct their own policy independent of that of Austria or of Prussia, and he was the leading supporter of the idea of the Trias, i.e. that the smaller states should form a closer union among themselves against the preponderance of the great monarchies. In 1863 he came forward as a warm supporter of the claims of the prince of Augustenburg to Schleswig-Holstein (see SCHLESWIG-HOLSTEIN QUESTION); he was the leader of the party in the German diet which refused to recognize the settlement of the war of 1866. As a statesman Beust was known for his coolness, and in 1866 he was appointed representative of the diet at the congress of London. He was thus thrown into opposition to the policy of Bismarck, and he was exposed to violent attacks in the Prussian press as a "particularist," i.e. a supporter of the independence of the smaller states. The expulsion of the Saxon troops from Rendsburg nearly led to a conflict with Prussia. Beust was accused of having brought about the war of 1866, but the responsibility for this must rest with Bismarck. On the outbreak of war Beust accompanied the king to Prague, and thence to Vienna, where they were received by the emperor with the news of Königgrätz. Beust undertook a mission to Paris to procure the help of Napoleon. When the terms of peace were discussed he resigned, for Bismarck refused to negotiate with him.

After the victory of Prussia there was no place for Beust in
BEUTHEN—BEVERLEY, W. R.

Germany, and his public career seemed to be closed, but he quite unexpectedly received an invitation from the emperor of Austria to become his foreign minister. It was a bold decision, for Beust was not only a stranger to Austria, but also a Protestant; but the choice of the emperor justified itself. Beust threw himself into his new position with great energy; it was owing to him that the negotiations with Hungary were brought to a successful issue. When difficulties came he went himself to Budapest, and acted directly with the Hungarian leaders. In 1867 he also held the position of Austrian minister-president, and he carried through the measures by which parliamentary government was restored. He also carried on the negotiations with the pope concerning the repeal of the concordat, and in this matter also did much by a liberal policy to relieve Austria from the pressure of institutions which had checked the development of the country. In 1868, after giving up his post as minister-president, he was appointed chancellor of the empire, and received the title of count. His conduct of foreign affairs, especially in the matter of the Balkan States and Crete, successfully maintained the position of the empire. In 1886 he accompanied the emperor on his expedition to the East. He was still to some extent influenced by the anti-Prussian feeling he had brought from Saxony. He maintained a close understanding with France, and there can be little doubt that he would have welcomed an opportunity in his new position of another struggle with his old rival Bismarck. In 1897, however, he helped to bring the affair of Luxemburg to a peaceful termination. In 1870 he did not disguise his sympathy for France, and the failure of all attempts to bring about an intervention of the powers, joined to the action of Russia in demanding a treaty by which France recognized the occasion of his celebrated saying that he was nowhere able to find Europe. After the war was over he completely accepted the new organization of Germany.

As early as December 1870 he had opened a correspondence with Bismarck with a view to establishing a good understanding with Germany. Bismarck accepted his advances with alacrity, and the new entente, which Beust announced to the Austro-Hungarian delegations in July 1871, was sealed in August by a friendly meeting of the two old rivals and enemies at Gastein.

In 1871 Beust interfered at the last moment, together with Andrassy, to prevent the emperor accepting the federalist plans of Hohenwart. He was successful, but at the same time he was dismissed from office. The precise cause for this is not known, and no reason was given him. At his own request he was appointed Austrian ambassador at London; in 1878 he was transferred to Paris; in 1882 he retired from public life. He died at his villa at Altenberg, near Vienna, on the 24th of October 1886, leaving two sons, both of whom entered the Austrian diplomatic service. His wife, a Bavarian lady, survived him only a few weeks. His elder brother Friedrich Konstantin (1866–1891), who was at the head of the Saxon department for mines, was the author of several works on mining and geology, a subject in which other members of the family had distinguished themselves.

Beust was in many ways a diplomatist of the old school. He had great social gifts and personal graces; he was proud of his proficiency in the lighter arts of composing waltzes and vers de société. His chief fault was vanity, but it was an amiable weakness. It was more vanity than rancour which made him glad to appear even in later years as the great opponent of Bismarck, and he carried too much for popularity, and was very sensitive to neglect, the saying attributed to Bismarck, that if his vanity were taken away there would be nothing left, is very unjust. He was apt to look more to the form than the substance, and attached too much importance to the verbal victory of a well-written despatch; but when the opportunity was given him he showed higher qualities. In the crisis of 1848 he displayed considerable courage, and never lost his judgment even in personal danger. If he was defeated in his German policy, it must be remembered that Bismarck held all the good cards, and in 1866 Saxony was the only one of the smaller states which entered on the war with an army properly equipped and ready at the moment. That he was no mere reactionary the whole course of his government in Saxony, and still more in Austria, shows. His Austrian policy has been much criticized, on the ground that in establishing the system of dualism he gave too much to Hungary, and did not really understand Austrian affairs; and the Austro-Hungarian crisis during the early years of the present century has given point to this view. Yet it remains the fact that in a crisis of extraordinary difficulty he was carried to a successful conclusion a policy which, even if it was not the best imaginable, was probably the best attainable in the circumstances.

Beust was the author of reminiscences: _Ausz drei Viertel-Jahrhunderiten_ (2 vols., Stuttgart, 1897; English trans. edited by Baron von Luxemburg); and his _Diplomatische Erinnerungen_ (Leipzig, 1891), in answer to the reminiscences on him by his former colleague, Herr v. Frieser, in his reminiscences. See also Ebeling, _F. F. Graf v. Beust_ (Leipzig, 1876), a full and careful account of his political career, especially up to 1866; _Diplomatic Sketches: No. 1, Count Beust, by Outsider_ (Baron Carl v. Malortie); Flathe, _Geschichte von Sachsen_, vol. iii. (Gotha, 1877); Friesen, _Erläuterungen zu meinem Leben_ (Dresden, 1880). (J. W. H.)

BEUYEN, or NIEBURYEN, a town of Germany, in the north of Prussian Silesia, on the Oder, the capital of the mediatised principality of Carolath-Beuthen. Pop. (1900) 3164. The chief industries of the place are straw-plaiting, boat-building, and the manufacture of pottery; and a considerable traffic is carried on by means of the river.

BEUYEN, or OBERBEUYEN, a town of Germany, in the extreme south-east of Prussian Silesia, on the railway between Breslau and Cracow, 121 m. S.E. of the former. Pop. (1905) 11,457. It is the centre of the mining district of Upper Silesia, and its population is mainly engaged in suprading the iron and zinc smelting. Beuthen is an old town, and was formerly the capital of the Bohemian duchy of Beuthen, which in 1626 was ultimately granted, as a free lordship of the Empire, to Lazarus, Baron Henckel von Donnersmarck, by the emperor Ferdinand II., and parts of which, now mediatized, are held by two branches of the counts Henckel von Donnersmarck.

BEVEL (from an O. Fr. word, cf. mod. _biveau, a joiner’s instrument_), the inclination of one surface of a solid body to another; also, any angle other than a right angle, and particularly the angle to which a piece of timber has to be cut. The mechanic’s instrument known as a bevel consists of a rule with two arms so jointed as to be adjustable to any angle. In heraldry, a bevel is an angular break in a line. Bevelment, as a term of crystallography, means the replacement of an edge of a crystal by two planes equally inclined to the adjacent planes. As an architectural term _"bevel"_ is a sloped or canted edge given to a sill or horizontal course of stone, but is more frequently applied to the canted edges worked round the projecting bands of masonry which for decorative purposes are employed on the quoins of walls or windows and in some cases, with vertical joints, cover the whole wall. When the outer face of the stone band is left rough so that it forms what is known as rusticated masonry, the description would be bevelled and rusticated. The term is sometimes applied to the splaying of the edges of a window on the outs de, but the wide expansion made inside in order to admit more light is known as a splay.

BEVERLEY, WILLIAM ROXBY (1814?–1889), English artist and scene-painter, was born at Richmond, Surrey, about 1814, the son of William Roxby, an actor-manager who had assumed the name of Beverley. His four brothers and his sister all entered the theatrical profession, and Beverley soon became both actor and scene-painter. In 1831 his father and his brothers took over the old Durham circuit, and he joined them to play heavy comedy for several seasons, besides painting scenery. His work was first seen in 1831 in London, for the pantomime _Baron Munchausen_ at the Victoria theatre, which was being managed by his brother Henry. He was appointed scenic director for the Covent Garden operas in 1833. In 1854 he entered the service of the Drury Lane theatre under the management of E. T. Smith, and for thirty years continued to produce
wonderful scenes for the pantomimes, besides working for Covent Garden and a number of other theatres. In 1831 he executed part of a great diorama of Jerusalem and the Holy Land, and produced dioramic views of the ascent of Mont Blanc, exhibited at the Egyptian Hall, Piccadilly, and in 1884 a panorama of the Lakes of Killarney. He was a frequent exhibitor of sea pictures at the Royal Academy from 1865 to 1880. In 1884 failing eyesight put an end to his painting. He died in comparative poverty at Hampstead on the 17th of May 1888. He was the last of the old school of one-man painters, and famed for the wonderful atmospheric effects he was able to produce. Although he was skilled in all the mechanical devices of the stage, and painted in 1881 scenery for Michael Strogoff at the Adelphi, in which for the first time the stage still of the place was placed in harmony with the background, he was strongly opposed to the new school of scene-builders.

BEVERLEY, a market town and municipal borough in the Holderness parliamentary division of the East Riding of Yorkshire, England, 8 m. N.N.W. of Hull by a branch of the North Eastern railway. Pop. (1901) 13,185. It lies in a level country east of the line of slight elevations known as the Wolds, near the river Hull, and has communication by canal with Hull. The church of St John the Evangelist, commonly called Beverley Minster, is a magnificent building, exceeding in size and splendour some of the English cathedrals. A monastery was founded here by John of Beverley (c. 640–721), a native of the East Riding, who was bishop successively of Hexham and of York, and was canonized in 1037. A college of secular canons followed in the 10th century, the prioryship which subsequently became a see of high dignity, and was held by Thomas Becket, afterwards archbishop of Canterbury. Of the existing building, the easternmost bay of the nave, the transepts with east and west aisles, the choir with aisles and short transepts, and the Lady chapel, are Early English, a superb example of the finest development of that style. The remainder of the nave is Decorated, excepting the westernmost bay which is Perpendicular, as is the ornate west front with its graceful flanking towers. The north porch is also a beautiful example of this style. The most noteworthy details within the church are the exquisite Early English staircase which led to the chapter house (no longer remaining), and the Percy tomb, a remarkable example of Decorated work, commemorating Eleanor, wife of Henry Percy (d. 1328). The church of St Mary is a cruciform building with central tower, almost entirely of Decorated and Perpendicular work. Though overshadowed by the presence of the minster, it is yet a very fine example of its style, its most noteworthy features being the tower and the west front. Beverley was walled, and one gate of the 15th century remains; there are also some picturesque old houses. The industries are tanning, iron-foundering, brewing and the manufacture of chemicals; and there is a large agricultural trade. Beverley is the seat of a suffragan bishop in the diocese of York. The municipal borough is under a mayor, 6 aldermen and 18 councillors, and has an area of 2,404 acres, including a large extent of common pasture land.

Beverley (Beverlac) is said to be on the site of a British settlement. Esquiline Bed existed there in 1394, since when it was restored by St John of Beverley, who also founded a monastery there and was himself buried in the church. In the devastation of the north of England which followed the Conquest, Beverley is said to have escaped by a miracle attributed to St John; the Norman leader, while about to enter and pillage the church, fell from his horse dead, and the king, thinking this a sign that the town was under the protection of heaven, exempted it from pillage. From the time of the Conquest until the dissolution of the manor and town of Beverley belonged to the archiepiscopal see of York, and is said to have been held under a charter of liberties similar to that granted to York and other boroughs. A charter, besides other privileges, is said to have granted "sanctuary in Beverley, and the "leng" over which this privilege extended was afterwards shown to include the whole town. Confirmations of this charter were confirmed by Charles I. in 1609 and Charles II. in 1663, and renewed by James II. on his accession. Parliamentary representation by two members began in the reign of Edward I., but lapsed, until the corporation charter of 1575, from which it date continued until the Reform Act of 1867.

In 1554–1555 Queen Mary granted the three fairs on the feasts of St John the Confessor, the Translation of St John and the Nativity of St John the Baptist, together with the Tuesday before and Saturday, which had been held by the archbishops of York by traditional grant of Edward the Confessor to the burgesses of the town. Cloth-weaving was one of the chief industries of Beverley; it is mentioned and appears to have been important as early as 1315.

BEVERLY, a seaboard city of Essex county, Massachusetts, U.S.A., situated on the N. shore of Massachusetts Bay, opposite Salem. It is 18 m. from Boston on the Boston & Maine railway. Pop. (1890) 10,821; (1900) 13,884, of whom 2814 were foreign-born; (1910, census) 18,650. The land area of the city is about 15 sq. m. The surface is the typical glacial topography, with a few low, rocky hills, less than 100 ft. in height. There are beautiful drives through well-wooded districts, studded with rocky elevations. The village was founded about 1663, and was known by the Indian name of "Beverly," a title given to the New York, Beverly, the New England industrial school for deaf mutes (organized, 1876; incorporated, 1879), and the Beverly historical society (1891), which owns a large colonial house, in which there is a valuable historical collection. The city has an excellent public school system. There are a number of manufacturing establishments; in 1905 the total factory product of the city was valued at $4,101,168, boots and shoes accounting for more than one-half of the total. Leather and shoe machinery also are important manufactures; and the main plant of the United Shoe Machinery Corporation is located here. Market gardening is a considerable industry, and large quantities of vegetables are raised under glass for the Boston markets. Fishing is an industry no longer of much importance. Beverly is connected by a regular line of oil-steamers with Port Arthur, Texas, and is the main distributing point for the Texas oil fields. The first settlement within the limits of Beverley was made by Roger Conant in 1626. The town was a part of Salem until 1668, when it was incorporated as a separate township; in 1804 it was chartered as a city. In 1788 there was established here the first cotton mill to be successfully operated in the United States. The manufacture of British wool was begun in 1812. John Cabot lived for many years in Beverly, which he represented in the provincial congress (1770); Nathan Dane (1752–1835) was also a resident; and it was the birthplace of Wilson Flagg (1805–1884), the author of Studies in the Field and Forest (1857), The Woods and By-Ways of New England (1872), The Birds and Seasons of New England (1873), and A Year with the Birds (1881). It was also the birthplace and early home of Lucy Larcom (1826–1893), and the scene of much of her Story of a New England Girlhood (Boston, 1858).

BEVIS, the name of an English metrical romance. Bevis is the son of Guy, count of Hampton (Southampton) and his young wife, a daughter of the king of Scotland. The countess asks a former suitor, Doon or Devoun, emperor of Almaine (Germany), to send an army to murder Guy in the forest. The plot is developed, and she marries Doon. When threatened with future vengeance by her ten-year-old son, she determines to make away with him also, but he is saved from death by a faithful tutor, is sold to heathen pirates, and reaches the court of King Hermin, whose realm is variously placed in Armenia, Armenia, or Armenia. He exploits his knowledge of languages, wins the hand of the king's daughter, Josiane, his mission to King Bradmound of Damascus with a sealed letter demanding his own death, his
imprisonment, his final vengeance on his stepfather are related in detail. After succeeding to his inheritance he is, however, driven into exile and separated from his mother, to whom he is reunited only after a few of them has contracted, in form only, a second union. The story also relates the hero's death and the fortunes of his two sons.

The oldest extant version appears to be <i>Boece de Hausdonc</i>, an Anglo-Norman text which dates from the first half of the 13th century. The English metrical romance, <i>Sir Beues of Hamton</i>, is founded on some French original varying slightly from those which have been preserved. The oldest MS. dates from the beginning of the 14th century. The French <i>chanson de geste</i>, <i>Beue de Hamstone</i>, was followed by numerous prose versions. The printed editions of the story are most numerous in Italy, where <i>Bavo d'Antona</i> was the subject of more than one poem, and the tale was interpolated in <i>Reali di Francia</i>, the Italian compilation of Carolingian legend. Although the English version that we possess is based on a French original, it seems probable that the legend took shape on English soil in the 10th century, and that it originated with the Danish invaders. Doon may be identified with the emperor Otto the Great, who was the contemporary of the English king Edgar of the story. R. Zenker (<i>Boece-Amtthue</i>, Berlin, 1883 and 1894) dates the original Bevis and the Hamlet legend as related by Saxo Grammaticus in the <i>Historia Danica</i>. Among the more obvious coincidences which point to a common source are the vengeance taken on a stepfather for a father's death, the letter bearing his own death-warrant which is entrusted to the hero, and his double marriage.1 The motive of the feigned madness is, however, lacking in Bevis. The princess who is Josiane's rival is less ferocious than the Hermuthrud of the Hamlet legend, but she threatens Bevis with death if he refuses her. Both seem to be modelled on the type of Thyrdro of the Beowulf legend. A fanciful etymology connecting Bevis (Boeve) with Béowulf (Bewulf), on the ground that both were dragon slayers, is inadmissible.

**Bibliography.**—<i>The Romance of Sir Beues of Hamton</i> edited from six MSS. and the edition (without date) of Richard Pynson, by E. Köbling (Early Eng. Text Soc., 1885-1886-1894); A. Stimming, "Der anglonormannische Boece de Haumonte," in H. Sucher's <i>Bibl. Norm</i>, vol. vii. (Halle, 1896); the Welsh version, with a translation, is given by R. Williams, Selections of the Hengwrt MSS. (vol. ii., London, 1892); the old Norse version by G. Cederstedt, <i>Forhan Skaldskap</i> (1884); A. Wessely, "Zum russischen Bavo d'Antona" (in Archiv für slav. Phil. vol. viii., 1885); for the early printed editions of the romance in English, French and Italian see G. Brunet, <i>Manuel du librare</i>, s.v. Bevis, Beufues and Buovo.

**Bewdley.** A market town and municipal borough in the Bewdley parliamentary division of Worcestershire, England; 137 m. N.W. by W. from London and 174 N. by W. from Worcester by rail. Pop. (1901) 2866. The Worcester-Shrewsbury line of the Great Western is here joined by lines from Birmingham and west from Tenbury. Bewdley is pleasantly situated on the sloping right bank of the Severn, on the eastern border of the forest of Wyre. A bridge by Telford (1797) crosses the river. A free grammar school, founded in 1501, was re-founded by James I. in 1606, and possesses a large library bequeathed in 1812. The town manufactures combs and horn goods, brass and iron wares, leather, malt, bricks and ropes. The town is governed by a mayor, 4 aldermen and 12 councillors. Area, 2015 acres.

Bewdley (i.e. Benuelle) is probably referred to in the Domedal says, "Chaffer Ribbesford," and was held by the king. The manor, then called <i>Bellus Locus</i> or Beaufieu on account of its beautiful situation, was afterwards granted to the Mortimers, in whose family it continued until 1265, when it was given to the heir of John de Brome. It is from this time that Bewdley dates its importance. Through its situation on the Severn it was connected with the sea, and in 1250 a bridge, the only one between it and Worcester, was built across it. The ancient heart of the town, containing the market place and the church, was called from Edward IV. Bewdley received its charter in 1472, and there appears to be no evidence that it was a borough before this time. Other charters were granted in 1605, 1685 and 1708. By James I.'s charter the burgesses sent one member to parliament, and continued to do so until 1855. A fair and a market on Wednesday were granted Edward III. in 1373 to his grand-daughter Philippa, wife of Edmund Mortimer, and confirmed to Richard, duke of York, by Henry VI. Edward IV. also granted the burgesses a market on Mondays, and three fairs, which were confirmed by Henry VII. In 1606 mines were worked in Bewdley as early as 1609, and the town was formerly noted for making caps.

**BEWICK, THOMAS** (1753-1828), English wood engraver, was born at Cherryburn, near Newcastle-on-Tyne, in August 1753. His father rented a small colliery at Micklebank, and sent his son to school at Mickley. He proved a poor scholar, but showed, at a very early age, a remarkable talent for drawing. He had no tuition in the art, and no models save natural objects. At the age of fourteen he was apprenticed to Mr Beilby, an engraver in Newcastle. In his office Bewick engraved on wood for Dr Hutton a series of diagrams illustrating a treatise on mensuration. He seems thereafter to have devoted himself entirely to engraving on wood, and in 1775 he received a premium from the Society for the Encouragement of Arts and Manufactures for a woodcut of the "Huntsman and the Old Hound." In 1784 appeared his <i>Select Fables</i>, the engravings in which, though far surpassed by his later productions, were incomparably superior to anything that had yet been done in that line. The <i>Bewick Fables</i> appeared in 1790, and his great achievement, that with which his name is inseparably associated, the <i>British Birds</i>, was published from 1797-1804. Bewick, from his intimate knowledge of the habits of animals acquired during his constant excursions into the country, was thoroughly qualified to do justice to his great task. Of his other productions the engravings for Goldsmith's <i>Traveller</i> and <i>Deserted Village</i>, for Parnell's <i>Hermit</i>, for Somerville's <i>Chase</i>, and for the collection of <i>Fables of Aesop and Others</i>, may be specially mentioned. Bewick was for many years in partnership with his elder brother, and when he died his larger edition and several of the smaller works were republished, together with many of the plates of the Bewick series. His son, who lived in London, and his grandsons, were also active in the wood engraving business.

His autobiography, <i>Memoirs of Thomas Bewick, by Himself</i>, appeared in 1862.

**BEXHILL,** a municipal borough and watering-place in the Rye parliamentary division of Sussex, England, 62 m. S.E. by S. from London, on the London, Brighton & South Coast, and the South-Eastern & Chatham railway (1891) 5206; (1901) 6019. The town, which lies on the slopes of the low hills fringing the coast, but the watering-place on the shore has developed very rapidly since about 1884, owing to the exertions of Earl De la Warr, who owns most of the property. It has a marine parade, pier, golf links, and the usual appointments of a seaside resort, while the climate is bracing and the neighbouring country pleasant. Bexhill was incorporated in 1902, the corporation consisting of a mayor, 6 aldermen and 18 councillors. Area, 8015 acres.

**BEXLEY, NICHOLAS VANSITTART,** Baron (1766-1851), English politician, was the fifth son of Henry Vansittart (d. 1770), governor of Bengal, and was born in London on the 26th of April 1766. Educated at Christ Church, Oxford, he took his degree in 1787, and was called to the bar at Lincoln's Inn in 1791. He began his public career by writing pamphlets in defence of the administration of William Pitt, especially on its financial side, and in May 1796 became member of parliament for Hastings, retaining his seat until July 1802, when he was returned for Old Sarum. In February 1801 he was sent on a diplomatic errand to Copenhagen, and should after his return have been appointed joint secretary to the embassy in that country, a position which he retained until the resignation of Addington's ministry in April 1804. Owing to the influence of his friend, Ernest, Duke of Cumberland, he became secretary for Ireland under Pitt in January 1805, resigning his office in the following September. With Addington, now Viscount Sidmouth, he joined the government of Fox and Grenville as secretary to the treasury in February 1806, leaving office with Sidmouth just before the fall of the ministry in March 1807.

---

1807. During these and the next few years Vansittart's reputation as a financier was gradually rising. In 1809 he proposed and carried without opposition in the House of Commons, a thirty-eight resolutions on financial questions, and only his loyalty to Sidmouth prevented him from joining the cabinet of Spencer Perceval as chancellor of the exchequer in October 1809. He opposed an early resumption of cash payments in 1811, and became chancellor of the exchequer when the Earl of Liverpool succeeded Perceval in May 1812. Having forsaken Old Sarum, he had represented Helston from November 1806 to June 1812; and after being member for East Grinstead for a few weeks, was returned for Harwich in October 1812.

When Vansittart became chancellor of the exchequer the country was burdened with heavy taxation and an enormous debt. Nevertheless, the continuance of the war compelled him to increase the customs duties and other taxes, and in 1813 he introduced a complicated scheme for dealing with the sinking fund. In 1816, after the conclusion of peace, a large decrease in taxation was generally desired, and there was a loud outcry when the chancellor proposed only to reduce, not to abolish, the property or income tax. The abolition of this tax, however, was carried in parliament, and Vansittart was also obliged to remove the duties on foreign metals, meeting the deficiency by borrowing. He devoted considerable attention to effecting real or supposed economies with regard to the national debt. He carried an elaborate scheme for handing over the payment of naval and military pensions to contractors, who would be paid a fixed annual sum for forty-five years; but no one was found willing to undertake this contract, although a modified plan on the same lines was afterwards adopted. Vansittart became very unpopular in the country, and he resigned his office in December 1822. His system of finance was severely criticized by Huskisson, Tierney, Brougham, Hume and Ricardo. On his resignation Liverpool offered Vansittart the post of chancellor of the duchy of Lancaster. Accepting this offer in February 1823, he was created Baron Bexley in March, and granted a pension of £3,000 a year. He resigned in January 1828. In the House of Lords Bexley took very little part in public business, although he introduced the Spitalfields weavers bill in 1823, and voted for the removal of Roman Catholic disabilities in 1824. He took a good deal of interest in the British and Foreign Bible Mission, the Church Missionary Society and kindred bodies, and assisted to found King's College, London. He died at Poole's Court, Kent, on the 8th of November 1835. His wife, whom he married in July 1806, was Isabella (d. 1819), daughter of William Eden, 1st Baron Auckland, and as he had no issue the title became extinct on his death. There are nine volumes of Vansittart's papers in the British Museum.

BEXLEY, an urban district in the Dartford parliamentary division of Kent, England, 12 m. S.E. by E. of London by the South-Eastern & Chatham railway. Pop. (1911) 12,918. Bexley, which is mentioned in Domesday Book, has had a church since the 9th century. The present church of St Mary is Early English and later. With the rental of the manor of Bexley, William Camden, the antiquary, founded the ancient history professorship at Oxford. Hall Place, which contains a fine Jacobean staircase and oak-panelled hall, is said to occupy the site of the dwelling-place of the Black Prince. The course of Watling Street may be traced over Bexley Heath, where, too, there exist deep pits, widening into vaults below, and probably of British origin.

BEY (a modern Turk. word, the older form being bey, cf. Pers. bāy), the head inhabitant of a district, now generally an honorific title throughout the Turkish empire; the granting of this in Egypt is made by the sultan of Turkey through the khedive. In Tunis "bey" has become the hereditary title of the reigning sovereigns (see Tunis).}

BEYBAZAR, the capital town of a kaza of the Angora vilayet in Asiatic Turkey, situated on an affluent of the Sakaria (anc. Sangarius), about 52 m. W. of Angora. It corresponds to the

anc. Lagonia, renamed Anastasiopolis under the emperor Anastasius (491-518), a bishopric by the 5th century. Its well-built wooden house-cove, the slopes of three hills at the mouth of a gorge filled with fruit gardens and vineyards, the chief products are rice, cotton and fruits. From Beybazar come the fine pears sold in Constantinople as "Angora pears"; its muskmelons are equally esteemed; its grapes are used only for a sweetmeat called jevizi-sujuk ("nutty fruit sausage"). There are few remains of antiquity apart from numerous rock-cut chambers lining the banks of the stream. Pop. about 4,000 to 5,000.

BEYLE, MARIE HENRI (1753-1842), better known by his nom de plume Sénègneville, French author, was born at Guillestre on the 23rd of January 1753. With his father, who was an avocat in the parlement of Grenoble, he was never on good terms, but his intractable disposition sufficiently explains his unhappy childhood and youth. Until he was twelve years old he was educated by a priest, who succeeded in inspiring him with a lasting hatred of clericalism. He was then sent to the newly established École Centrale at Grenoble, and in 1770 to Paris with a letter of introduction to the Daru family, with which the Beyles were connected. Pierre Daru offered him a place in the ministry for war, and with the brothers Daru he followed him to Italy, where he met Manzoni, a city for which he conceived a lasting attachment. Much of his Histoire de Parme seems to be autobiographical of this part of his life.

He was a spectator of the battle of Marengo, and afterwards enlisted in a dragoon regiment. With rapid promotion he became adjutant to General Michaud; but after the peace of Amiens in 1802 he returned to study in Paris. There he met an actress, Mélanie Guibert, whom he followed to Marseilles. His father cut off his supports on hearing of this escapade, and Beyle was compelled to serve as a clerk to a grocer. Mélanie Guibert, however, soon abandoned him to marry a Russian, and Beyle returned to Paris. Through the influence of Daru he obtained a place in the commissariat, which he filled with some distinction from 1806 to 1814. Charged with raising a levy in Brunswick of five million francs, he extracted seven; and during the retreat from Moscow he discharged his duties with efficiency. On the fall of Napoleon he refused to accept a place under the new régime, and retired to Milan, where he met Silvio Pellico, Manzoni, Lord Byron and other men of note. At Milan he contracted a love affair with a certain Angelina Polar, and when this affair was discovered he deserted her in 1813, leaving his wife and eldest son the Marquis of Beyle in France. In 1814 he published, under the pseudonym of Alexandre César Bombet, his Lettres écrites de Vienne en Autriche sur le célèbre compositeur, Joseph Haydn, suivies d'une vie de Mozart, et de considérations sur Métastase et l'état présent de la musique en Italie. His letters on Haydn were borrowed from the Haydini (1812) of Joseph Carpani, and the section on Mozart had no greater claim to originality. The book was reprinted (1817) as Vies de Haydn, Mozart et Métastase. His Histoire de la peinture en Italie (2 vols., 1817) was originally dedicated to Napoleonic memory and was used as the basis of his history of Italian art, which was published under the notice of the Austrian authorities, and he was exiled from Milan. In Paris he felt himself a stranger, as he had never received French contemporary art in literature, music or painting. He frequented, however, many literary salons in Paris, and found some friends in the "idéologues" who gathered round Destutt de Tracy. He was the most closely allied with Prosper Mérimée, a dilettante and an ironist like himself. He published at this time his Essai sur l'amour (1822), of which only seventeen copies were sold in eleven years, though it afterwards passed into two editions. He gathered round him, at the Hôtel des Ambassadeurs at 19, rue de Rossini (1832), "un nouveau complot contre les industriels (1832), Promenades dans Rome (1839), and his first novel, Armand, ou quelques scènes de Paris en 1827 (1827). After the Revolution of 1830 he was appointed consul at Trieste, but the Austrian government refused to accept him, and he was sent to Civita Vecchia instead. Le Rouge et le noir, chronique du XIXe siècle (2 vols., 1830) appeared in Paris after his departure, but attracted
BEYRICH—BEZA

839

small notice. He had published in 1838 Mémoires d'un touriste, and in 1839 La Chartreuse de Parme (2 vols.), which was the last of his publications, and the first to secure any popular success, though his earlier writings had been regarded as significant by a limited public. It was enthusiastically reviewed by Balzac in his Revue Parisienne (1840). Beyle remained at Civita Vecchia, discharging his duties as consul punctually and with frequent intervals of absence until his death, which took place in Paris on the 11th of May 1842. He wrote his own epitaph,1 describing himself as a Milanese.

His posthumous works include a fragmentary Vie de Napoléon (1873); Mélanges d'art et de littérature (1867); Chroniques italiennes (1885), including "L'Abbesse de Castro," "Les Cenci," "Vittoria Accoramboni," "Vivina Vanini," "La Duchesse de Pallino," some of which has appeared separately; Romans et nouvelles et Nouvelles intiédées (1853); Correspondance (2 vols., 1853); Lamiel (ed. C. Striyenski, 1880); his Journal 1801-1874 (ed. Striyenski and F. de Nion, 1888), of which the section dealing with the Russian and German campaigns is unedited, and a great part of the development of the French novel must be traced to him. Brunetière has pointed out (Manual of French Lit., Eng. trans., 1898) that Stendhal supplied the Romanticists with the notion of the interchange of the methods and effects of poetry, painting and music, and that in his worship of Napoleon he agreed with their glorification of individual energy. Stendhal, however, thoroughly disliked the Romanticists, though Sainte-Beuve acknowledged (Causières du lundi, vol. i.) that his books gave ideas. Taine (Essais de critique et d'histoire, 1857) found in him a great psychologist; Zola (Romanciers natureliture, 1881) actually claimed him as the father of the naturalist school; and Paul Bourget (Essais de psychologie contemporaine, 1883) cited Le Rouge et le noir as one of the classic novels of analysis.

The 1846 edition of La Chartreuse de Parme contains a prefatory notice by R. Colomb, and a reprint of Balzac's article. In addition to the authorities already mentioned see the essay on Beyle (1850) by Paul Morand; A. Patrice, Beyle, écrivain, biographie (1874); Adolphe Paupe, Histoire des œuvres de Stendhal (1903); A. Chauquet, Stendhal-Beyle (1902); a review by R. Doumic (Revue des deux mondes, February 1902), depreciating the excessive attention paid to Beyle's writings; and Edouard Rod, Stendhal (1892) in the "Grands écrivains français" series. See also Correspondance de Stendahl, 1800-1842, with preface by M. Barrès (Paris, 1908).

BEYRICH, HEINRICH ERNST VON (1815-1866), German geologist, was born at Berlin on the 31st of August 1815, and educated at the university in that city, and afterwards at Bonn, where he studied under Goldfuss and Nögerath. He obtained his degree of Ph. D. in 1837 at Berlin, and was subsequently employed in the mineralogical museum of the university, becoming director of the palaeontological collection in 1857; and director of the museum in 1875. He was one of the founders of the German Geological Society in 1848. He early recognized the value of palaeontology in stratigraphical work; and he made important researches in the Rhenish mountains, in the Harz and Alpine districts. In later years he gave special attention to the Tertiary strata, including the Brown Coal of North Germany. In 1854 he proposed the term Oligocene for certain Tertiary strata intermediate between the Eocene and Miocene; and the term is now generally adopted. In 1865 he was appointed professor of geology and palaeontology in the Berlin University, where he was eminently successful as a teacher; and when the Prussian Geological Survey was instituted in 1873 he was appointed co-director with Wilhelm Hauecorne (1828-1900). He published Beiträge zur Kenntniss der Versteinerungen des rheinischen Übergangs-gebirges (1857); Über einige böhmische Trilobiten (1845); Die Couchefiles des norddeutschen Tertiärgebirges (1853-1857). He died on the 9th of July 1866.

BEYSLAG, WILLIBALD (1823-1900), German Protestant theologian, on the 24th of June 1859. Of good descent, his parents were known for generous piety. He owed his education to an uncle, Nicolas de Bèze, counsellor of the Paris parliament, who placed him (1599) under Melchior Wolmar at Orleans, and later at Bourges. Wolmar, who had taught Greek to Calvin, grounded Beza in Scripture from a Protestant standpoint; after his return to Germany (1534) Beza studied law at Orleans (May 1535 to August 1539), beginning practice in Paris (1539) as law licentiate. To this period belong his exercises in Latin verse, in the loose taste of the day, foolishly published by him as Juvenilia in 1548. Troubhau, in a work, he held two benefices. A severe illness wrought a change; he married his mistress, Claude Desnoz, and joined the church of Calvin at Geneva (October 1548). In November 1549 he was appointed Greek professor at Lausanne, where he acted as Calvin's adjutant in various publications, including his defence of the burning of Servetus, De Haereticis a civili magistratu puniendis (1554). In 1558 he became professor in the Geneva academy, where his career was brilliant. His conspicuous ability was shown in the abortive Colloquy of Poissy (1561). On Calvin's death (1564) he became his biographer and administrative successor. As a historian, Beza, by his chronological inexactitude, has been the source of serious mistakes; as an administrator, he softened the rigour of Calvin. His editions and Latin versions of the New Testament had a marked influence on the English versions of Geneva (1557 and 1560) and London (1611). The famous codex D. was presented by him (1581) to Cambridge University, with a characteristically dubious account of the history of the manuscript. His works are very numerous, but of little moment, except those already mentioned. He resigned his offices in 1600, and died on the 13th of October 1655. He had taken a second wife (1588), Catherine del Pouhon, a widow, but left no issue. He was not the author of the Histoire ecclésiastique (1586), sometimes ascribed

1 Quil giace Arrigo Beyle Milanese: visse, scrisse, amò.
BEZANT—BÉZIERS

to him; nor, probably, of the vulgar slight published under the name of Benedict Panavagnits (1551).

See Laigneau, De Vita et Moribus (1585, calumnious); Antoine la Fayre, De Vita et Obitu (1606, eulogistic); Schlosser, Leben (1806); Baum, Th. Bena, portrait (1843-1851); Hepp, Leben (1863). (A. Go.)

BEZANT or BYZANT (from Byzantium, the modern Constantinople), originally a Byzantine gold coin which had a wide circulation throughout Europe up to about 1250. Its average value was about nine shillings. Bezants were also issued in Flanders and Spain. Silver bezants, in value from one to two shillings, were in circulation in England in the 13th and 14th centuries. In Wycliffe's translation of the Bible he uses the word for a "talent" (e.g. in Luke xv. 8). In heraldry, bezants are represented by gold circles on the shield, and were introduced by the crusaders.

BEZANTÉE, in architecture, a name given to an ornamented moulding much used in the Norman period, resembling the coins (bezants) struck in Byzantium.

BEZBORODKO, ALEKSANDR ANDREEVICH, PRINCE (1747-1790), grand chancellor of Russia, was born at Gluchov on the 14th of March 1747, and educated at home and in the clerical academy at Kiev. He entered the public service as a clerk in the office of Count P. A. Rumyantsev, then governor-general of Little Russia, whom he accompanied to the Turkish War in 1768. He was present at the engagements of Larga and Kaluga, and at the storming of Silistria. On the conclusion of the peace of Kuchuk-Kainarji (1774) the field marshal recommended him to Catharine II., and she appointed him in 1775 her private secretary. He thus had the opportunity of impressing on the empress with her brilliant gifts, the most remarkable of which were exquisite manners, a marvellous memory and a clear and pregnant style. At the same time he set to work to acquire the principal European languages, especially French, of which he became a master. It was at this time that he wrote his historical sketches of the Tatar wars and of Little Russia.

His activity was prodigious, and Catharine called him her factotum. In 1780 he accompanied her on her journey through White Russia, meeting the emperor Joseph, who urged him to study diplomacy. On his return from a delicate mission to Copenhagen, he presented to the empress "a memorial on political affairs" which comprised the first plan of a partition of Turkey between Russia and Austria. This document was transmitted almost word for word to Vienna as the Russian proposals. He followed this up by Epitomised Historical Information concerning Moldavia. For these two state papers he was rewarded with the posts of "plenipotentiary for all negotiations" in the foreign office and postmaster-general. From this time he was inseparably associated with Catharine in all important diplomatic affairs, though officially he was the subordinate of the vice-chancellor Count Alexander Osterman. He wrote all the most important despatches to the Russian ministers abroad, concluded and subscribed all treaties, and performed all the functions of a secretary of state. He identified himself entirely with Catharine's political ideas, even with that of re-establishing the Greek empire under her grandson Constantine. The empress, as usual, richly rewarded her comes with pensions and principalities. In 1786 he was promoted to the senate, and it was through him that the empress communicated her will to that august state-decorration. In 1789 he accompanied Catharine on her triumphal progress through South Russia in the capacity of minister of foreign affairs. At Kapiev he conducted the negotiations with the Polish king, Stanislaus II., and at Novyua Kaldaniya he was in the empress's carriage when she received Joseph II.

The second Turkish War (1787-92) and the war with Gustavus III. (1788-90) heaped fresh burdens on his already heavily laden shoulders, and he suffered from the intrigues of his numerous jealous rivals, including the empress's latest favourite, A. M. Mamonov. All his efforts were directed towards the conclusion of the two oppressive wars by an honourable peace. The pause of Verelë with Gustavus III. (14th of August 1790) was on the terms dictated by him. On the sudden death of Potemkin he was despatched to Jassy to prevent the peace congress there from breaking up, and succeeded, in the face of all but insuperable difficulties, in concluding a treaty exceedingly advantageous to Russia (9th of January 1792). For this service he received the thanks of the empress, the ribbon of St Andrew and 50,000 roubles. On his return from Jassy, however, he found his confidential post of secretary of petitions occupied by the empress's last favourite, who retained the favour of Paul by "diminution of his dignity" to the empress in a private memorial in the course of 1793. The empress reassured him by fresh honours and distinctions on the occasion of the solemn celebration of the peace of Jassy (2nd of September 1793), when she publicly presented him with a golden olive-branch encrusted with brilliants. Subsequently Catharine reconciled him with Zubov, and he resumed the conduct of foreign affairs.

He contributed more than any other man to bring about the downfall and the third partition of Poland, for which he was magnificently recompensed. But diplomacy by no means exhausted Bezborodko's capacity for work. He had a large share in the internal administration also. He reformed the post-office, improved the banking system of Russia, regulated the finances, constructed roads, and united the Unitas and Orthodox churches.

On the death of Catharine, the emperor Paul entrusted Bezborodko with the examination of the late empress's private papers, and shortly afterwards made him a prince of the Russian empire, with a correspondingly splendid appanage. On the retirement of Osterman he received the highest dignity in the Russian empire—that of imperial chancellor. Bezborodko, as the only Russian who had retained the favour of Paul to the last, during the last two years of his life the control of Russia's diplomacy was entirely in his hands. His programme at this period was peace with all the European powers, revolutionary France included. But the emperor's growing aversion from this pacific policy induced the astute old minister to attempt to "seek safety in moral and physical repose." Paul, however, refused to accept his resignation and would have sent him abroad for the benefit of his health, had not a sudden stroke of paralysis prevented Bezborodko from taking advantage of his master's kindness. He died at St Petersburg on the 6th of April 1799. In private life Bezborodko was a typical Catharian, corrupt, licentious, conscienceless and self-seeking. But he was infinitely generous and affectionate, and spent his enormous fortune liberally. His banquets were magnificent, his collections of pictures and statues unique in Europe. He was the best friend of his innumerable poor relatives, and the Maceenas of all the struggling authors of his day. Syphotic he might have been, but he was neither ungrateful nor vindictive. His patriotism is as indisputable as his genius.

See Sornikh (Collections) of the Imperial Russian Historical Society (Fr. and Russ.), vols. 60-100 (St Petersburg, 1870-1904); Nikolai Ivanovich Grigorovitch, The Chancellor A. A. Bezborodko in Connexion with the Events of His Time (Russ., St Petersburg, 1879-1881). (R. N. B.)

BEZEL (from an O. Fr. word, cf. Mod. Fr. biseau, basilé, possibly connected with Lat. bis, twice), a sloping edge, as of a cutting tool, also known as basilé. In jewelry, the term is used for the oblique sides or faces of a gem; the rim which secures the crystal of a watch in position or a jewel in its setting, and particularly the enlarged part of a ring on which the device is engraved (see Ring).

BÉZIERS, a town of southern France, capital of an arrondissement in the department of Hérault, 47 m. S.W. of Montpellier by rail. Pop. (1906) 46,262. Béziers is situated in a wine-growing district on a hill on the left bank of the river Orb, which is joined at this point by the Canal du Midi. The Allées Paul Riquet, named after the creator of the canal, occupy the centre of Béziers and divide the old town with its maze of narrow and irregular streets from the new quarter to the east. They form a long and shady promenade, terminating at one end in the Place de la République and the theatre, the front of which is decorated with bas-reliefs by David d'Angers,
and at the other in a beautiful park, the Plateau des Poêtes. The most interesting portion of the town is the extreme west where the old ramparts overlook the Orb. Above them towers St Nazaire, the navel of the church, seven Béziers; it dates from the 13th to the 14th centuries and is a good specimen of the ecclesiastical fortification common in southern France. Its chief artistic features are the rose window in the western façade, and the stained glass and curious iron grilles of the choir-windows, which belong to the 14th century. Adjoining the south transept there are Gothic cloisters of the 14th century. The Orb is crossed by four bridges, the railway bridge, an ancient bridge of the 14th or 15th century, a modern bridge and the fine aqueduct by which the Canal du Midi is carried over the river. About half a mile to the south-east of the town on the top of the cliffs of Puylaurens, in which in 1350 yds. the water of the canal descends 80 ft. to reach the level of the Orb. There are remains of a Roman arena which have been built into the houses of the rue St Jacques. Béziers is seat of a sub-prefect and has tribunals of first instance and of commerce, communal colleges and several learned societies. It is an agricultural market and carries on an active trade in wine, brandy, fruit, leather and sulphur. Its industries are chiefly connected with the wine trade (cask and cork making, &c.) and there are important distilleries. It also has iron-works and tanneries.

The Romans established a colony at Béziers, and it was the headquarters of the seventh legion, under the title of Boetiarum Septimanorum. The present name occurs in the form Bexora as early as Festus Avienus (later 4th century). The town was completely destroyed in 1200 by the forces of Simon de Montfort in the crusade against the Albigenses, on which occasion 20,000 persons were massacred. The walls were rebuilt in 1298; but the town again suffered severely in the civil and religious wars of the 16th century, and all its fortifications were destroyed in 1632. BÉZIQUE (probably from Span. bezique, little kiss, in allusion to the meeting of the nose and knave, an important feature in the game) is a game at cards played with two similar packs from which the twos, threes, fours, fives and sixes have been rejected, shuffled together and used as one. It is modelled on a group of card games which possess many features in common; the oldest of these is mariage, then follow brusquemille, l'homme de brou, briscan or brisque, and cinq-cents. Bézique (also called besi and besigue) is, in fact, brisque played with a double pack, and with certain modifications rendered necessary by the introduction of additional cards. The cards rank as follows: Ace, ten, king, queen, knave, nine, eight, seven for players is for two players. The players cut for deal, and the higher bázique card deals. The objects of the play are: (1) to promote the hand various combinations of cards, which, when declared, entitle the holder to certain scores; (2) to win aces and fives, known as "brises"; (3) to win the so-called last trick. The dealer deals eight cards to each, first three, then two, and again three. The top card of those remaining (called the "stock") is turned up for trumps. As sometimes played, the first marriage, or the first sequence, decides the trump suit; there is then no score for the seven of trumps (see below). The stock is placed face downwards between the players and slightly spread. The non-dealer leads any card, and the dealer plays to it, but need not follow suit, nor win the trick. If he wins the trick by playing a higher card of the same suit led, or a trump, the lead falls to him. In case of ties the leader wins. Whoever wins the trick leads to the next; but before playing again each player takes a card from the stock and adds it to his hand, the winner of the trick taking the top card. This alternate playing and drawing a card continues until the stock (including the trump card or card exchanged for it, which is taken up last) is exhausted. The tricks remain face upwards on the table, but must not be searched during the play of the hand.

The scores are shown as follows:

<table>
<thead>
<tr>
<th>Table of Bézique Scores</th>
</tr>
</thead>
<tbody>
<tr>
<td>Seven of trumps, turned up, dealer marks</td>
</tr>
<tr>
<td>Seven of trumps, declared (see below) or exchanged, player marks</td>
</tr>
</tbody>
</table>

Marriage (king and queen of a suit) declared | 20 |
Royal marriage (king and queen of trumps) declared | 40 |
Bézique (queen of spades and knave of diamonds) declared | 60 |
Double báuzique (all the four bázique cards) declared | 100 |
Four aces (any four, whether duplicates or not) declared | 160 |
Four kings (any four) declared | 180 |
Four queens (any four) declared | 80 |
Four knaves (any four) declared | 60 |
Sequence of ace, ten, king, knave of trumps declared | 250 |
Aces and tens, in tricks, the winner for each one mark | 10 |
Last trick of all (as sometimes played, the last trick before the stock is exhausted) the winner marks | 10 |

A "declaration" can only be made by the winner of a trick immediately after he has won it, and before he draws from the stock. It is effected by placing the declared cards (one of which at least must not have been declared before) face upwards on the table, where they are left, unless they are played, as they may be. A player is not bound to declare. The card led or played cannot be declared. More than one declaration may be made at a time, provided no card of one combination forms part of another that is declared with it. Thus four knaves and a marriage may be declared at the same time; but a player cannot declare king and queen of spades and knave of diamonds to gether to score marriage and báuzique. He must first declare one combination, say báuzique; and when he wins another trick he can score marriage by declaring the king. A declaration cannot be made of cards that have already all been declared. Thus, if four knaves (one being a báuzique knave) and four queens (one being a báuzique queen) have been declared, the knave and queen already declared cannot be declared again as báuzique. To score all the combinations with these cards, after the knaves are declared and another trick won, báuzique must next be made, after which, on winning another trick, the three queens can be added and four queens scored. Lastly, a card once declared can only be used again in declaring in combinations of a different class. For example: the báuzique queen can be declared in báuzique, marriage and four queens; but having been declared, a single holden cannot be declared again with another single báuzique. Two declarations may, in a sense, be made to a trick, but only one can be scored at the time. Thus with four kings declared, including the king of spades, báuzique can be declared and scored, but the spade marriage cannot be scored till the holder wins another trick. The correct formula is "Forty, and 20 to score." The seven of trumps may be either declared or exchanged for the turn-up after winning a trick, and before drawing. When exchanged, the turn-up is taken into the player's hand, and the seven put in its place. The second seven can, of course, be used whenever declared is left on the table, but is simply shown.

The winner of the last trick can declare anything hitherto undeclared in his hand. After this all declarations cease. The winner of the last trick takes the last card of the stock, and the loser the turn-up card (or seven exchanged for it). All cards on the table, that have been declared and not played, are taken up by their owners. The last eight tricks are then played, but the second player must follow suit if able, and must win the trick if able. Finally, each player counts his tricks for the aces and tens they may contain, (as is often done) they are scored at the time. If a player revokes in the last eight tricks, or does not win the card led, if able, the last eight tricks belong to his adversary. The deal then passes on alternately until the game (1000) is won. If the loser does not make 500, his opponent counts a double game, or double points, according as they have agreed. The score is best kept by means of a special báuzique-mark. 

Three- and Four-Handed Bézique.—When three play, three packs are used together. All play against each other. The player on the left of the dealer is first dealt eight cards. Seven are led, the rotation of dealing goes to the left. If double báuzique has been scored, and one pair has been played, a second double báuzique may be made with the third pair and the pair on the table. Triple báuzique scores 1500. All the cards of the trumps are left on the table, as they are played, and are displayed to a trick. All may be declared together, or a double báuzique may be added to a single one, or a third báuzique may be added to a double báuzique already declared. The game is 2000
up. Sometimes the three players cut, the one who cuts the highest card plays against the other two in consultation, and continues to do so till the allies win a game, when the two cut as before to see who shall be the single player. Only two packs are then used.

The packs are used in a counterclockwise order; each player has one when score independently or may play as partners. A second double bêzique or triple bêzique may be scored as before; to form them the bêziques may be declared by the players or the adversary or in consultation. Any player may declare them he or his partner takes a trick. In playing the last eight tricks, the winner of the last trick and the adversary to his left play their cards against each other, and then the other two similarly. Four people playing in pairs by consultation, only two packs being then required.

Polish Bêzique (also called "Open Bêzique" and "Fildinski") differs from ordinary bêzique in the following particulars. The game is of two phases. If the player who is to open in each phase wins the trick places it face upwards in front of him (the same with both cards if two scoring cards are played to a trick), forming rows of face-upwards cards, known as the open temple (open playing cards). Cards of the same denomination are placed overlapping one another lengthwise from the player towards his adversary to economise space. When a scoring card is placed among the open cards, all the sevens, eights, nines, and plain suit tens in the cards are turned down and put on one side. Open cards cannot be played a second time, and can only be used in declaring. Whether so used or not, the remaining face-upwards cards on the table until the end of the hand, including the eight trumps, are the player's own cards, or he can declare after winning a trick and before drawing again, when the trick won contains a card or cards, which he adds to his open cards complete any combinations he may form. Every open card that is thus added must be played to the trick last won. Aces and tens must be scored as soon as won, and not at the end of the hand. The seven of trumps can be exchanged by the winner of the trick containing it; and if the turn-up card is ten, the player may play any ten on the first, becoming the second player when exchanged. The seven of trumps when not exchanged is scored for by the player winning the trick containing it.

Cards are allowed, i.e. cards added to the open cards can at once be used, without waiting to win another trick, in as many combinations of different classes as they will form with the winner's open cards. For example: A has three open kings, and he has a trick containing a king. Before drawing again, A scores the fourth king with the other three, and scores 80 for kings. This is a simple declaration. But suppose the card led was the queen of trumps, A wins it with the king, and he has the following open cards: three queens, ten, nine, eight, seven. He at once declares royal marriage (40); four kings (80); four queens (60); and sequence (250); and scores in all, 430. Again: as of spades is turned up, and ace of hearts is led. The second player has two open aces, and wins the ace of hearts with the seven of trumps and exchanges. He scores for the exchange, 10; for the ace of hearts, 10; for the ace of spades, 10; and adds the aces to his open cards, and scores 100 for 5 aces in all. If a declaration or part of a component declaration is omitted, and the winner of the trick draws again, he cannot amend his score.

The ordinary rule holds that a second declaration cannot be made of cards already declared in the first. Thus: A is married cannot be married again; a fifth king added to four already declared does not entitle to another score for kings. The fundamental rule in mind in these declarations can be effected by means of cards held in the hand. Thus: A has three open queens and a queen in hand cannot add it to his open cards. He must win another trick containing a queen, when he can declare queens. Declarations can continue during the play of the last eight tricks just the same as during the play of the other cards.

Bruzion Bêzique.—Four packs are used. Nine cards are dealt to three to each player. The rules of Polish bêzique hold good in regard to dealing, leading, playing to lead, drawing and declaring; but a player who receives a hand containing no picture-card (king, queen, or jack) of a suit other than carte blanche may be declared as shown. He may not draw a picture-card, he can again score for carte blanche. The trump suit is decided by the first sequence or marriage declared. As four packs are used, triple and quadruple bêzique may be made. Tricks are taken as usual. Trick cards are added as usual. Cards are scored, except carte blanche, remain on the table. If the holder of carte blanche holds four aces and wins the first trick, he can declare his ace for 100 points. The player that already scores for trumps is made for him. The cards are the same as at ordinary bêzique. Declaration is not compulsory. Cards led or played cannot be declared. There are three classes of declarations: marriage (1), in which he is led (1) marriage and sequence, (2) bêzique, (3) fours. A card once declared can be led a second time, but only in an equal or superior class. If a card of a declared combination is played to a trick, another card of the same rank may be used to form a second similar combination; e.g. if aces be declared and one of them be played by the playing of a fifth ace, aces can be declared again. If a player has a chance of a double declaration he can declare both, but he may only score one at the time. As in other variations of bêzique he announces, say, "forty, and twenty to score." He should repeat, "Twenty to score," after every trick, unless he is legally bound or in consultation. A declaration he makes cannot be scored if he cannot score the points. To the last nine tricks, after the stock is exhausted, the second player must follow suit and win the trick by trumping or over-playing, if he can. The winner of the odd trick scores 25 points. The game consists of one deal. In reckoning the score all fractions of 100 are neglected; the winner scores 500 for game in addition to the difference between his own points and his opponent's. The "Czech" rule is observed in bruking. If he not score 1000 points, in which case the winner adds the loser's points to his own, takes 500 for games and 1000 for game, but the loser may claim his brises and open a rubicon, though they are not reckoned among his points. If the rubber card player has scored less than 100 the opponent counts the score as 100.

BEZWADA, a town of British India, in the Kistna district of Madras, on the left bank of the river Kistna, at the head of its delta. Pop. (1901) 24,224. Here are the headquarters of the Kistna canal system, which irrigates more than 500,000 acres, and also provides navigation throughout the delta. The anicut or dam at Bezwada, begun in 1282, consists of a mass of rubble, fronted with masonry, 1240 yds. long. Here also is the central junction of the East Coast railway from Madras to Calcutta, 267 m. from Madras, where one branch line comes down from the Warangal coalfield in the Nizam's Dominions, and another from Bellary. The Madras mail starts from Bezwada. Ancient cuttings on the hills west of Bezwada have been held by some mark of a Buddhist monastery; by others they are considered to have been quarries. At Undavalle to the south are some noted cave-shrines.

BHAGALPUR, a city of British India, in the Behar province of Bengal, which gives its name to a district and to a division; situated on the right bank of the Ganges, 265 m. from Calcutta. It is a station on the East Indian railway. Pop. (1901) 75,750, showing an increase of 6% in the decade. The chief educational institution is the Tejnarayan Jubilee college (1887), supported almost entirely by fees. Adjacent to the town are the two Augustus Cleveland monuments, one erected by government, and the other by the Hindus, to the memory of the civilian, who, as collector of Bhagalpur at the end of the 18th century, "by conciliation, confidence and benevolence, attempted and accomplished the entire subjection of the lawless and savage inhabitants of the Jungleterry of Rajmahal."

The District of Bhagalpur stretches across both banks of the Ganges. It has an area of 4226 sq. m. In 1901 the population was 5,688,953, showing an increase of 3% in the ten years. Of the total, 244,314 were British, of whom 11,039 were Eurasians. Of the total 4,944,640 were cultivators, 653,593 were laborers, and 355,670 were not gainfully occupied. The volcanic hills—the Ganges, Kusi and Ghagri. The Ganges runs a course of 60 m. through Bhagalpur, is navigable all the year round, and has an average width of 3 m. The Kusi rises in the Himalayas and falls into the Ganges near Kolgang within Bhagalpur. It is a fine stream, navigable up to the foot of the hills, and receives the Ghagri 8 m. above its debouchure. In the early days of British administration the hill people, the Nats and Santals, gave much trouble. They were the original inhabitants of the country whom the Aryan conquerors had driven back into the barren hills and unprofitable forests. They averaged from generation to generation by plundering and ravaging the plains. The efforts to subdue or restrain these marauders proved fruitless, till Augustus Cleveland won them by mild measures, and successfully made over the protection of the
district to the very hill people who a few years before had been its scourge. Rice, wheat, barley, oats, Indian corn, various kinds of millet, pulses, oil-seeds, tobacco, cotton, indigo, opium, flax and hemp and sugar-cane, are the principal agricultural products of Bhagalpur district. The jungles afford good pasturage in the hot weather, and abound in lac, silk cocoons, batuche, resin and the mahud fruit, which is both used as fruit and for the manufacture of spirits. Lead ores (chiefly argentiferous galena) and building stone are found, and iron ore is distributed over the hilly country. Attempts made to work the galena in 1878–79 and 1900 were abandoned, and the iron ore is little worked.

Gold is washed from the river sand in small particles.

The climate of Bhagalpur partakes of the character both of the deltaic districts of Bengal and of the districts of Behar, between which it is situated. The hot season sets in about the end of March, and continues till the beginning of June, the temperature at this time rising as high as 110° Fahr. The rains usually begin at the end of June and last till the middle of September; average annual rainfall, 55 in. The cold season commences at the beginning of November and lasts till March. During December and January the temperature falls as low as 41° Fahr. The average annual temperature is 78°. Bhagalpur formed a part of the ancient Sanskrit kingdom of Anga. In later times it was included in the powerful Hindu kingdom of Magadha or Behar, and in the 7th century A.D. it was an independent state, with the city of Champa for its capital. It afterwards formed a part of the Mahomedan kingdom of Gaur, and was subsequently subjugated by Akbar, who declared it to be a part of the Delhi empire. Bhagalpur passed to the East India Company by the grant of the emperor Shah Alam in 1765.

There are indigo factories, and other industries include the weaving of tussur silk and the making of coarse glass. A large trade is carried on by rail and river with Lower Bengal. The tract south of the Ganges is traversed by the loop-line of the East Indian railway, and there is also a railway across the northern tract.

The district of Bhagalpur stretches across the Ganges from the Nepal frontier to the hills of Chota Nagpur. It comprises the five districts of Monghyr, Bhagalpur, Purna, Darjeeling, and the Santal Parganas. The total area is 10,776 sq. m.; and in 1901 the population was 8,901,405.

BHARO, a town and district of Burma. The town was in ancient times the capital of the Shan state of Mannaw, later the seat of a Burmese governor. It is now the headquarters of a district in the Mandalay division of Upper Burma (Chinese frontier). It is situated about 300 m. up the river from Mandalay. It is the highest station on the Irrawaddy, and the nearest point on the river to the Chinese frontier. In 1901 it contained 10,734 inhabitants, of whom a considerable number were Chinamen, natives of India and Shan-Chinese. It stretches for a distance of nearly 4 m. along the Irrawaddy bank in a series of small villages, transformed into quarters of the town, but the town proper is confined mainly to the one high ridge of land running at right angles to the river. The surface of the ground is much cut up by ravines which fill and dry up according to the rise and fall of the river. When the Irrawaddy is at its height the lower portion of the town is flooded, and the country, alluvial in character, is a sheet of water, but usually for not very long time. Here or hereabouts has long been the terminus of a great land commerce from China. For years after its annexation by Great Britain in 1853 the trade routes were unsafe owing to attacks from Kachins. These have now ceased, and the roads, which were mere bridle-tracks, have been greatly improved. The two chief are the so-called Santa and Ponlaing route, through Manyin (Manwaing) and Nantien to Momein, and the southern or Sawadi route by way of Namkam. Cart roads are now being constructed on both routes, and that south of the Taiping river could easily be continued through Manyin to Momein if the Chinese should be induced to co-operate. There is a fairly large military garrison in Bhamo distributed between two forts to the north and east of the town. There are in general stationed here a native regiment, two sections of a battery and the wing of a European regiment. Besides the barracks there are a circuit house, dak bungalow, courthouse, and post and telegraph offices. There is a branch railway from Myitkyina to Katha, whence there is daily communication by river to Bhamo.

The District of Bhamo lies wholly in the basin of the Irrawaddy, which, as well as its tributaries, runs through the heart of it. On the east of the river is the Shan plateau, running almost due north and south. West of the Irrawaddy there is a regular series of ranges, enclosing the basins of the Kaukkwe, Mosit, Indaw and other streams, down which much timber is floated. Beyond the Kaukkwe there is a ridge of hills, which starts at Leka, near Mogaung, and diverges to the south, the eastern ridge dividing the Kaukkwe from the Mosit, and the western forming the eastern watershed of the Nam Yin and running south into Katha. In a year offshoot from the latter of these ridges that forms the third divide of the Irrawaddy between Bhamo and Simbo. The district covers an area of 4,146 sq. m., and the population in 1901 was 79,515. It is mainly composed of Shan-Burmese and Kachins. The Shan-Burmese inhabit the valleys and alluvial plains on each side of the river. The Kachins, who probably came from the sub-regions of the Himalayas, occupy the hills throughout the district. There are also settlements of Shans, Shan-Chinese, Chinese and Assamese. There are extensive fisheries in the Shwega and Mo-huyin circles, and in the Indaw, a chain of lakes just behind the Mosit, opposite Shwegu.

The district is bounded on the north by the dist. of Shwegu, having borders representing 60,000 acres of teak plantation. The whole of the country along the banks of the Irrawaddy, the Mole, Taiping and Kaukkwe, is generally in a water-logged condition during the rains. The climate in the district is therefore decidedly malarious, especially at the beginning and end of the rains. From November to March there is very bracing cold weather. The highest temperatures range a few degrees over 105° F. up to 106°, and the lowest a few degrees under 40°. The average maximum for the year is about 87°, the average minimum about 62°. The rainfall averages 72 in. (J. G. Scott).
BHANG—BHARATPUR

pulse, linseed, and a little sugar-cane. The district is traversed by the main road from Nagpur to the east, and also by the Bengal-Nagpur railway. It suffered in the famine of 1866-1867, and yet more severely in 1900.

Bhandara district contains 25 semi-independent chiefships. These little states are exempted from the revenue system, and only pay a light tribute. Their territory, however, is included within the returns of the semi-independent states. The climate of Bhandara is unhealthy,—the prevailing diseases being fever, small-pox and cholera. Nothing is known of the early history of the district. Tradition says that at a remote period a tribe of men, called the Gaulis or Gaulars, overran and conquered it. At the end of the 17th century it belonged to the Gond raja of Deogarh. In 1743 it was conquered by the Marhattas, who governed it till 1853, when it passed to the British government, the raja of Nagpur having died without an heir.

BHANG, an East Indian name for the hemp plant, Cannabis sativa (see HEMP), but applied specially to the leaves dried and prepared for use as a narcotic drug. In India the products of the plant for use as a narcotic and intoxicant are recognized under the three names and forms of Bhang, Gunja or Ganja, and Churrus or Charas. Bhang consists of the larger leaves and capsules of the plant on which an efflorescence of resinous matter has occurred. The leaves are in broken and partly agglutinated pieces, having a dark-green colour and a heavy but not unpleasant smell. Bhang is used in India for smoking, or with or without tobacco; it is prepared in the form of a cake or in the form of a liquid by infusing by means of a nosegay into cold water and straining. Gunja is the flowering or fruit-bearing tops of the female plants. It is gathered in stalks of several inches in length, the tops of which form a matted mass, from the agglutination of flowers, seeds and leaflets by the abundant resinous exudation which coats them. Churrus is the crude resinous substance separated from the plant. The use of preparations of hemp among the Mussulman and Hindu population of India is very general; and the habit also obtains among the population of Central Asia, the Arabs and Egyptians, extending even to the negroes of the valley of the Zambezi and the Hottentots of South Africa. The habit appears to date from very remote times, for Herodotus says of the Scythians, that they creep inside huts and throw hemp seeds on hot stones.

BHARAHAT, or BARIHUT, a village in the small state of Nagod in India, lying about 34° 15' N. by 80° 45' E., about 130 m. S.W. of Allahabad. General A. Cunningham discovered there in 1873 the remains of a stupa (i.e. a burial mound over the ashes of some distinguished person) which were excavated, in 1874, by his assistant, J. D. Beggan. The results showed that the stone was of Burmese or Malay origin, and it is made into an indicating beverage by infusing in cold water and straining. Gunja is the flowering or fruit-bearing tops of the female plants. It is gathered in stalks of several inches in length, the tops of which form a matted mass, from the agglutination of flowers, seeds and leaflets by the abundant resinous exudation which coats them. Churrus is the crude resinous substance separated from the plant. The use of preparations of hemp among the Mussulman and Hindu population of India is very general; and the habit also obtains among the population of Central Asia, the Arabs and Egyptians, extending even to the negroes of the valley of the Zambezi and the Hottentots of South Africa. The habit appears to date from very remote times, for Herodotus says of the Scythians, that they creep inside huts and throw hemp seeds on hot stones.

BHARAL, or BAHUR, a village in the small state of Nagod in India, lying about 34° 15' N. by 80° 45' E., about 130 m. S.W. of Allahabad. General A. Cunningham discovered there in 1873 the remains of a stupa (i.e. a burial mound over the ashes of some distinguished person) which were excavated, in 1874, by his assistant, J. D. Beggan. The results showed that the stone was of Burmese or Malay origin, and it is made into an indicating beverage by infusing in cold water and straining. Gunja is the flowering or fruit-bearing tops of the female plants. It is gathered in stalks of several inches in length, the tops of which form a matted mass, from the agglutination of flowers, seeds and leaflets by the abundant resinous exudation which coats them. Churrus is the crude resinous substance separated from the plant. The use of preparations of hemp among the Mussulman and Hindu population of India is very general; and the habit also obtains among the population of Central Asia, the Arabs and Egyptians, extending even to the negroes of the valley of the Zambezi and the Hottentots of South Africa. The habit appears to date from very remote times, for Herodotus says of the Scythians, that they creep inside huts and throw hemp seeds on hot stones.

BHARATPUR, or BHURTOORE, a native state of India, in the Rajputana agency. Its area covers 382 sq. m. The country is generally level, about 700 ft. above the sea. Small detached hills, rising to 200 ft. in height, occur, especially in the northern part. These hills contain good building stone for ornamental architecture, and in some of them iron ore is abundant. The Banganga is the only river which flows through the state. It takes its rise at Manoharpur in the territory of Jaipur, and flowing eastward passes through the heart of the Bharatpur state, and joins the Jamna below Agra.

Bharatpur rose to importance under Suraj Mall, who bore a conspicuous part in the destruction of the Delhi empire. Having built the forts of Dig and Kumbher in 1736, he received in 1756 the title of raja, and subsequently joined the great Marhatta army with 30,000 troops. But the misconduct of the Maharatta leader induced him to abandon the confederacy, just in time to escape the murderous defeat at Panipat. Suraj Mall raised the Jat power to its highest point; and Colonel Dow, in 1770, estimated the raja's revenue (perhaps extravagantly) at £2,000,000 and his military force at 60,000 or 70,000 men. The Jat was a semi-nomadic and warlike people, offensive and defensive, with Bharatpur. In 1804, however, the raja assisted the Maharattas against the British. The English under Lord Lake captured the fort of Dig and besieged Bharatpur, but were compelled to raise the siege after four attempts at storming. A treaty, concluded on the 17th of April 1805, guaranteed the raja's territory; but he became bound to pay £200,000 as indemnity to the East India Company. A dispute as to the right of the succession again led to a war in 1832, and Lord Coghmore captured Bharatpur with a besieging force of 20,000 men, after a desperate resistance on the 18th of January 1836. The fortifications were dismantled, the hostile chief being deported to Benares, and an infant son of the former raja installed under a treaty favourable to the company. In 1853 the Bharatpur ruler died, leaving a minor heir. The state came under British management, and the administration was improved, the revenue increased, a system of irrigation developed, new tanks and wells constructed and an excellent system of roads and public buildings organized. Owing to the hot winds blowing from Rajputana, the climate of Bharatpur is extremely sultry till the setting in of the periodical rains.

In 1901 the population was 626,665, a decrease of 2%. The estimated revenue is £180,000. The maharaja Ram Singh, who succeeded his father in 1893, was deprived of power of government
in 1895 on the ground of intemperate conduct; and in 1900 he was finally deposed for the murder of one of his personal attendants. He was succeeded by his infant son Kishen Singh. During his minority the administration was undertaken by a native minister, together with a state council, under the general supervision of the Rajputana diwan. The Temple service caviary are maintained. The state is traversed for about 40 m. by the Rajputana railway.

The City of Bharatpur is 34 m. W. of Agra by rail. The population in 1901 was 43,601, showing a decrease of over 23,000 in the decade. The immense mud ramparts still stand. It has a handsome palace, a new hospital and a high school. There are special manufactures of chaunris, or flappers, with handles of sandalwood, ivory or silver, and tallies also made of strips of ivory or sandalwood as fine as horse-hair.

Bhatnagarn, a town of Nepal, 8 m. from Khatmandu. It is a celebrated place of Hindu superstition, the favourite residence of the Brahmins of Nepal, and contains more families of that order than either Khatmandu or Patan. It has a population of about 30,000, and its palace and buildings generally are of a more striking appearance than in other Nepalese towns. The town is said to possess many Sanskrit libraries.

Bhittiana, a tract of country in the Punjab province of India, covering the Ghaggar valley from Fathabad in the district of Hissar to Bhatain in Bikanir. It derives its name from the Bhittis, a wild Rajput clan, who held the country lying between Hariana, Bikanir and Bahawalpur. It skirts the borders of the great sandy desert, and only contains a small and scattered population. This tract was ravaged by Timur in his invasion of India; and in 1795 paid a nominal allegiance to George Thomas, the adventurer of Hariana. After the victories of Lord Lake in 1803 it passed with the rest of the Delhi territory under British rule, but was not settled until 1810. A district of Bhittiana was formed in 1837, but in 1858 it was merged in the Sirsa district, which was divided up in 1884. The Bhittis number some 350,000, and are a fine tall race, making capital use of horses.

Bhau Daji (Ramkrishna Vithal) (1825-1874), Hindu physician of Bombay, Sanskrit scholar and antiquary, was born in 1822 at the village of Manjare, in the native state of Sawantwari, of humble parents dealing in clay dolls. Dr Bhau's career is a striking instance of great results arising from small accidents. An Englishman noticing his cleverness at chess induced his father to give the boy an English education. Accordingly Bhau was brought to Bombay and was educated at the Elphinstone Institution. He relieved his father of the cost of his education by winning his school and scholarship prizes, and when he was two years later he cheerfully undertook the burden of supporting his mother and a brother (Narayan), who also in after-life became a distinguished physician and surgeon. About this time he gained a prize for an essay on infanticide, and was appointed a teacher in the Elphinstone Institution. He began to devote his time to the study of Indian antiquities, deciphering inscriptions and ascertaining the dates and history of ancient Sanskrit authors. He then studied at the Grant Medical College, and was one of the first batch who graduated there in 1859. In 1857 he set up as a medical practitioner in Bombay, where his skill and good sense at once made him a fortune. He studied the Sanskrit literature of medicine, and also tested the value of drugs to which the ancient Hindus ascribed marvellous powers, among other pathological subjects of historical interest investigating that of leprosy. Being an ardent promoter of education, he was appointed a member of the board of education, and was one of the original fellows of the university of Bombay. As the first native president of the students' literary and scientific society, and the champion of the cause of female education, a girls' school was founded in his name, for which an endowment was provided by his friends and admirers. In the political progress of India he took a great and active interest, and the Bombay Association and the Bombay branch of the East Indian Association owe their existence to his ability and exertions. He was twice chosen sheriff of Bombay, in 1869 and 1871. Various scientific societies in England, France, Germany and America conferred on him their membership. He contributed numerous papers to the journal of the Bombay branch of the Royal Asiatic Society. He found time to make a large collection of rare ancient Sanskrit manuscripts at great cost and trouble. He died in May 1874. His brother, Dr Narayan Daji (who helped him to set up the charitable dispensary in Bombay), did not long survive him. Dr Bhau was a man of the most simple and amiable character and manners; his kindness and sympathy towards the poor and distressed were unbounded, and endeared his memory among the Hindus of Bombay. (N. B. W.)

Bhunagar, or Bhavnagar, a native state of India in the Kathiwar agency, Bombay. Its area covers 2860 sq. m. In 1901 the population was 412,664, showing a decrease of 12% in the decade; the estimated revenue is £255,500, and the tribute £36,300. The chief, whose title is thakor sahib, is head of the famous clan of the Gohel Rajputs of Kathiwar. The enlightened system of administration formed during the rule of the thakor sahib maharaja Sir Takhtsinghji Jaswatsinghji, G.C.S.I., was continued with admirable results under the personal supervision of his son, the maharaja Bhausingshi, K.C.S.I. (b. 1873), and forms a model for other native states. The Gohel Rajputs are said to have settled in the district about 1260. Bhunagar suffered terribly from the famine of 1899-1900. About 60 m. of the Bhunagar-Gondal railway run through the state, with its terminus at the terminus of the town railway station.

The town of Bhunagar is situated on the west coast of the gulf of Cambay. The population in 1901 was 36,442. It is the chief port in Kathiwar, though only admitting vessels of small burden. It was founded in 1723 by the thakor sahib Bhausingshi, after whom it is named, in place of his former capital, Sihor, which was considered too exposed to the Mahatta power.

Bheesty (from the Persian bheestîh, paradise), the Hindustani name for a water carrier, the native who supplies water from a piggadee or goat-skin bag.

Bherra, a town of British India, in the Shapoor district of the Punjab, situated on the river Jhelum. Pop. (1901) 18,680. It is the terminus of a branch of the North-Western railway. It is an important centre of trade, with manufactures of cotton goods, metal-work, carving, &c. Bherra was founded about 1540 on its present site, but it took the place of a city on the opposite bank of the river, of far greater antiquity, which was destroyed at this period.

Bhils, or Bheels ("bowmen," from Dravidian bil, a bow), a Dravidian people of central India, probably aborigines of Marwar. They live scattered over a great part of India. They are said to descend from the Gonds, or from the prehistoric Gonds, and as far north as the Aravalli Hills, in Sind and Rajputana, as well as Khandesh and Ahmedabad. They are mentioned in Sanskrit works, and it is thought that Ptolemy (vii. 1. 60) refers to them as Phalokas ("leaf wearers"), though this word might equally apply to the Gonds. Expelled by the Aryans from the richer lowlands, they are found to-day in greatest numbers on the hills of central India. In many Rajput states the princes on succession have their frontiers marked with blood from the thumb or toe of a Bhil. The Rajputs declare this a mark of Bhil allegiance, but it is more probably a relic of days when the Bhils were a dangerous tribe across the hills of India. The Bhils eagerly keep the practice alive, and the right of giving the blood is hereditary in certain families. The popular legend of the Bhil origin assigns them a semi-divine birth, Mahadeva (Siva) having wedded an earth maiden who bore him children, the ugliest of whom killed his father's bull and was banished to the mountains. The Bhils of to-day claim to be his descendants. Under the Moguls the Bhils were submissive, but they rebelled against the Maharratts, who, being unable to subdue them, treated them with the utmost cruelty. The race became outlaws, and they have lived their present wild life ever since. Their nomadic habits and skill, and the power of their bows helped them to maintain successfully the fight with their oppressors. An unsuccessful attempt was made in 1818 by the British to conquer them. Military measures were then tried, and the Bhil Agency was formed in 1825. The Bhil corps was then organized.
BHIMA—BHUTAN

with a view to utilizing the excellent fighting qualities of the tribesmen. This corps has done good service in gradually reducing their more lawless countrymen to habits of order, and many Bhils are now settled in regular industries.

The pure Bhil is to-day much what he has always been, a savages' type dweller. The Bhils are a stunted race, but well built, active and strong, of a black colour, with high cheek-bones, wide nostrils, broad noses and coarse features. Like all Dravidians the hair is long and wavy. The lowland Bhils are not now easily distinguished from the low-caste Hindus. Surgeon-major T. H. Hendley writes:—"The Bhil is an excellent woodman, knows the shortest cuts over the hills; can walk the roughest paths and climb the steepest crags without slipping or feeling distressed. Though robbers, and timorous owing to ages of ill-treatment, the men are brave when trusted, and very faithful. History proves them always to have been faithful to their nominal Rajput sovereigns, especially in their adversity. The Bhil is a merry soul, loving a jest." The hill Bhils wear nothing but a loin-cloth, their women a coarse robe; lowland Bhils wear turban, coat and waist-cloth. The Bhils have oaths none of them will break. The most sacred is that sworn by a dog, the Bhil praying that the curse of a dog may fall on him if he breaks his word. Their chief divinity is Hanuman, the monkey-god. Offerings are made to the much-feared goddess of smallpox. Stone worship is found among them, and some lowland Bhils are Moslems while many have adopted Christianity.

The Bhils of pure blood number upwards of a million, and there are some 200,000 Bhils of mixed descent.

BHIMA (Sanskrit, "The Terrible"), in Hindu mythology, a hero, one of the Pandava princes who figure in the *Mahabharata*. He is here represented as having his head in the bull's and the body of a man.

BHIWANI, a town of British India, in the Hissar district of the Punjab, 38 m. S.E. of Hissar town by rail. Pop. (1901) 35,917. It is an important centre of trade with Rajputana, and has factories for ginning and pressing cotton, and metal manufactures. Its rise dates from 1817, when it was made a free market.

BHOPAL, a native state of India, in the central India agency. Its area is 6902 sq. m., and its population in 1901 was 665,601, showing a decrease of 30% in the decade. This seems to be in part due to a difference in numeration, but the state suffered heavily from famine in 1898-1899 and 1899-1900. Bhopal is the capital of the Central Muslim state of central India, ranking next to Hyderabad among the Mahomedan states of India. The surface of the country is uneven, being traversed by the Vindhyâ ranges, a peak of which near Raysen is upwards of 2500 ft. above sea-level. The general inclination of the country is towards the north, in which direction most of the streams of the state flow, while others, passing through the Vindhyâ ranges, flow to the Nerbudda.

Bhopal state was founded in 1723 by Dost Mohammad Khan, an Afghan adventurer. In 1778, when General Thomas Goddard marched against the city of Bhopal, it was the only Indian power that showed itself friendly; and in 1800 when another British expedition under General Close appeared in the same parts, the nawab of Bhopal petitioned earnestly but in vain to be received under British protection. But in 1817, at the outbreak of the Pindari War, a treaty of dependence was concluded between the chief and the British government. Since then Bhopal has been steadily loyal to the British government, and during the Mutiny it rendered good services. The throne has descended in the female line since 1844, when Sikanjiwan Begum became ruler. Succeeding begums have taken a great interest in the work of governing the state, which they carried on with marked success. The sultan Jahan Begum, succeeded on the death of her mother, Shah Jahan Begum, in June 1901, being the only female ruler in India.

The estimated revenue of the state is Rs. 2,500,000, and the state pays a subsidy of Rs. 1,500,000 to the Bhopal state in constant service of the Bhopal state. Besides the Bhopal regiment, a regiment of imperial service cavalry is maintained, under the name of the Victoria Lancers. There is a branch railway from Itarsi to Bhopal city, continued to Jhansi. The British currency has been introduced, and in 1807-1808, Rs. 71,000,000 of Bohpalli coins were converted. The residence of the political agent and the headquarters of the Bhopal state are at Sehore, 20 m. west of Bhopal city. The city of Bhopal, a railway station, had a population in 1901 of 76,562. The palace, with its rock fortress, is called Fatehgah. An excellent water-supply has been provided from two large artificial lakes. There are two hospitals. There is an export trade in opium.

BHOPAL AGENCY, an administrative section of central India, takes its name from the state of Bhopal, which is included in it. The Bhopal agency is administered by the agency to the government in central India. Its area is 11,053 sq. m., and its population in 1901 was 1,157,607. It was created in 1818. In 1900 this district suffered severely from famine owing to the complete failure of the monsoon, and the cultivated area decreased by 30 or 60%; but, on the whole, trade has improved of late years owing to the new railways, which have stimulated commerce and created fresh centres of industry.

BHOPAWAR, an agency in central India. It consists of the Dhar and Barwani states, three minor states, Ali Rupur, Jhabua and Jobat, and a number of districts and estates. Its total area is 768 sq. m., and its population on this area in 1901 was 547,546. But in 1901 and 1904 certain districts were transferred from this agency to the Indore residency, created in 1899, and the area of Bhopawar was thus reduced by 328 sq. m. The chief towns are Dhar (pop. 17,792), Barwani (6277) and King (5402).

BHOR, a native state of India, in the Poona political agency, Bombay, forming one of the Satara Jagirs; situated among the higher peaks of the Western Ghats. Its area covers 925 sq. m. The population in 1901 was 157,628, showing a decrease of 12% to the decadence; the area's greatest revenue is Rs. 21,457; the tributes, Rs. 15,126. The chief, whose title is Baron Bhor, is a Brahman by caste. The town of Bhor is 25 m. south of Poona. In 1901 the Western Ghats, or means of communication between the sea-coast and the Deccan. Since 1861 it has been traversed by the main line of the Great Indian Peninsula railway.

BHUV, a town of India, the capital of the native state of Kach in the Gujarat division of Bombay, situated at the base of a fort. The population in 1901 was 137,268. It contains some interesting temples. The area's greatest revenue is Rs. 24,537; the tributes, Rs. 10,126. A Brahman by caste. The town of Bhor is 25 m. south of Poona. In 1901 the Western Ghats were covered by the main line of the Great Indian Peninsula railway.
Physically the Bhutias are a fine race, although dirty in their habits and persons. Their food consists of meat, chiefly pork, turnips, rice, barley-meal and tea made from the brick-tea of China. Their favourite drink is *chong*, distilled from rice or barley and millet, and *Marud*, beer made from fermented millet. A loose woollen coat reaching to the knees, and bound round the waist by a thick fold of cotton cloth, forms the dress of the men; the women dress in the longer ranges of the country.

The houses of the Bhutias are of three and four storeys; all the doors are neatly boarded with deal; and on two sides of the house is a verandah ornamented with carved work generally painted. The Bhutias are neat joiners, and their doors, windows and paneling are perfect in their way. No iron-work is used; the doors open on ingenious wooden hinges. The appearance of the houses is precisely that of Swiss chalets, picturesque and comfortable—the only drawback being a want of chimneys, which the Bhutias do not know how to construct. The people nominally profess the Buddhist religion, but in reality their religious exercises are confined to the propitiation of evil spirits, and the mechanical recital of a few sacred sentences. Around the cottages in the mountains the land is cleared for cultivation, and produces thriving crops of barley, wheat, buckwheat, millet, mustard, chilies, etc. Turnips of excellent quality are extensively grown; they are free from fibre and remarkably sweet. The wheat and barley have a full round grain, and the climate is well adapted to the production of both European and Asiatic vegetables. Potatoes have been introduced. The Bhutias lay out their fields in a series of terraces cut out of the sides of the hills; each terrace is riveted and is defended by embankments, sometimes 20 ft. high. Every field is carefully fenced with pine branches, or protected by a stone wall. A complete system of irrigation permeates the whole cultivated part of a village, the water being often brought from a long distance by stone aqueducts. Bhutias do not care to extend their cultivation, as an increased revenue is exacted in proportion to the land cultivated, but devote their whole energies to make the land yield twice what it is estimated to produce. The forests of Bhutan abound in many varieties of stately trees. Among them are the beech, ash, birch, maple, cypress and yew. Firs and pines cover the mountain heights; and below these, but still at an elevation of eight or nine thousand feet, is a zone of vegetation, consisting principally of oaks and rhododendrons. The cinnamon tree is also found. Some of the roots and branches were examined by Captain Samuel Turner during his journey to Tibet; but the plant being neither in blossom nor bearing fruit, it was impossible to decide whether it was the true cinnamon or an inferior kind of cassia. The leaf, however, corresponded with the description given of the true cinnamon. The *Lama* or general chief of the Bhutia is an inoffensive animal in life. Elephants are so numerous as to be dangerous to travellers; but tigers are not common, except near the river Tista, and in the dense reed jungle and forests of the Dwarps. Leopards abound in the Hah valley; deer everywhere, some of them of a very large species. The musk deer is found in the snows, and the barking deer on every hill side. Wild hogs are met with even at great elevations. Large squirrels are common. Bears and rhinoceros are also found. Pelicans, jungle fowls, pigeons and other small game abound. The Bhutias are no sportmen. They have a religious objection to firing a gun, thinking that it offends the deities of the woods and valleys, and brings down rain. A species of horse, which seems indigenous to Bhutan, and is used as a domestic animal, is called *tungan*, from Tangastan, the general appellation of that assemblage of mountains which constitutes the territory of Bhutan. It is peculiar to this tract, not being found in any of the neighbouring countries of Assam, Nepal, Tibet or Bengal, and unites in an eminent degree the two qualities of strength and beauty. The *tungan* horse usually stands about thirteen hands high, is short-bodied, clean-limbed, deep-chested, and expresses in his countenance an inclination to piety. In so barren and rude a country the manufacturing industry of its people is, as might be expected,
in a low stage, the few articles produced being all destined for home consumption. These consist of coarse blankets and cotton cloths made by the villagers inhabiting the southern tract. Leather, from the hide of the buffalo, imperfectly tanned, furnishes the soles of snow boots. Circular bowls are neatly turned from various woods. A small quantity of paper is made from bamboo, and avoided the Daphne papillo. Swords, iron spears and arrow-heads, and a few copper caldrons, fabricated from the metal obtained in the country, complete the list of manufactures.

Trade connections are rather with Tibet than with India. In 1901-1902 the value of the import and export trade with British India amounted only to £57,000. The military resources of the country are on an insignificant scale. Beyond the guards for the defence of the various castles, there is nothing like a standing army. The total military force was estimated by the British envoy in 1864 at 6000. The climate of Bhutan varies according to the difference of elevation. At the time when the inhabitants of Punakha (the winter residence of the rajas) are afraid of exposing themselves to the blazing sun, those of Ghassa experience all the rigour of winter, and are chilled by perpetual snows. Yet these places are within sight of each other. The rains descend in floods upon the heights; but in the vicinity of Taisudon, the capital, they are moderate; there are frequent showers, but nothing that can be compared to the tropical rains of Bengal. Owing to the great elevation and steepness of the mountains, this rise among the hollows, often attended with fatal results.

History.—Bhutan formerly belonged to a tribe called by the Bhutias Tephu, generally believed to have been the people of Kuch Behar. About a.d. 1670 some Tibetan soldiers subjugated the Tephus, took possession of the country and settled down in it. The relations of the British with Bhutan commenced in 1772, when the Bhutias invaded the principality of Kuch Behar, a dependency of Bengal. The Kuch Behar Raja applied for aid, and a force under Captain James was despatched to his assistance; the invaders were expelled and pursued into their own territories. Upon the interruption of the Rangoon treaty of peace was concluded in 1774 between the East India Company and the ruler of Bhutan. In 1783 Captain S. Turner was deputed to Bhutan, with a view of promoting commercial intercourse, but his mission proved unsuccessful. From this period little intercourse took place with Bhutan, until the occupation of Assam by the British in 1826. It was then discovered that the Bhutias had usurped several tracts of low land lying at the foot of the mountains, called the Dwaras or passes, and for these they agreed to pay a small tribute. They failed in their object, and availed themselves of the command of the passes to commit depredations within the British territory. Captain R. B. Pemberton was accordingly deputed to Bhutan to adjust the points of difference. But his negotiations yielded no definite result; and every other means of obtaining redress and security proving unsuccessful, the Assam Dwaras were wrested from the Bhutias, and the British government consented to pay to Bhutan a sum of £1000 per annum as compensation for the resumption of their tenure, during the good behaviour of the Bhutias. Continued outrages and aggressions were, however, committed by the Bhutias on British subjects in the Dwaras. No threats, standing repeated remonstrances and threats, scarcely a year passed without the occurrence of several raids in British territory headed by Bhutia officials, in which they plundered the inhabitants, massacred them, or carried them away as slaves. In 1863 Sir Ashley Eden was sent as an envoy to Bhutan to demand reparation for these outrages. He did not succeed in his mission; he was subjected to the grossest insults; and under compulsion signed a treaty giving over the disputed territory to Bhutan, and making other concessions which the Bhutan government demanded. On Sir A. Eden's return the viceroy at once dissolved his treaty, sternly stopped the former allowance for the Assam Dwaras, and demanded the immediate restoration of all British subjects kidnapped during the last five years. The Bhutias not complying with this demand, the governor-general issued a proclamation, dated the 12th of November 1864, by which the eleven Western or Bengal Dwaras were forthwith incorporated with the queen's Indian dominions. No resistance was at first offered to the annexation; but, suddenly, in January 1865, the Bhutias surprised the English garrison at Dewangiri, and the post was abandoned with the loss of two mountain guns. This disaster was soon avenged at the hands of the Bhutias; they were compelled to sue for peace, which was concluded on the 11th of November 1865. The Bhutan government formally ceded all the eighteen Dwaras of Bengal and Assam, with the rest of the territory taken from them, and agreed to liberate all kidnapped British subjects. As the revenues of Bhutan mainly depended on these Dwaras, the British government, in return for these concessions, undertook to pay the Deb and Dham rajas annually, subject to the condition of their continued good behaviour, an allowance beginning at £2500 and rising gradually to the present figure. Since that time the annexed territories have settled down into peaceful and prosperous British districts. The recent relations between the Indian government and Bhutan have been satisfactory; and during the troubles with Tibet in 1904 the attitude of the Bhutias was perfectly correct and friendly.

BIANCHINI, FRANCESCO (1662-1729), Italian astronomer and antiquary, was born of a noble family at Verona on the 13th of December 1662. In 1684 he went to Rome, and became librarian to Cardinal Ottoboni, who, as Pope Alexander VIII. (1689), raised him to the offices of papal chamberlain and canon of Santa Maria Maggiore. Clement XI. sent him on a mission to Paris in 1712, and employed him to form a museum of Christian antiquities. He died at Rome on the 2nd of March 1729. A paper by him on G. D. Cassini's new method of parallaxes was inserted in the Acta Eruditorum of Leipzig in 1685. He published separately:—Istoria Universale (Roma, 1697), only one volume of which appeared; De Calendario et Cyclo Caesaris (1703); Hasperi et Phosphori nova Phaenomena (1729), in which he asserted Venus to revolve in 24½ days; and (posthumously) Astronomicae et Geographicae Observationes Selectae (1737) and Opuscula Varia (1754).

See Fontenelle's "Eloge" (Mémoires de l'Acad. de l'Histoire, p. 102, Paris, 1759); Mazzoleni, Vita di Francesco Bianchini (Verona, 1735); Tipaldo, Biografia degli Italiani Illustri, vii. 488 (Venezia, 1840); Mazzucchelli, Scrittori d' Italia; Maffei, Verona Illustrata, p. 254, &c.

BIARRITZ, a watering-place of south-western France, in the department of Basses-Pyrénées, on the sea-coast about 5 m. W.S.W. of Bayonne. Pop. (1900) 13,629. From a mere fishing village, with a few hundred inhabitants in the beginning of the 19th century, Biarritz has risen to fame under the patronage of the emperor Napoleon III. and the empress Eugénie, with whom it was a favourite resort. The town is situated on a promontory jutting north-west into the Bay of Biscay and on the coast which extends on each side of it. The beach to the north-east is known as the Grande Plage, that to the south-west as the Côte des Basques. The Grande Plage is more than half a mile long and stretches to the Cap St Martin, on which stands a lighthouse. It is divided into two parts by a small headland once the site of the villa of the empress Eugénie, between which and the main promontory are the two casinos, the principal baths and many luxurious villas and fine hotels. Towards the north-east the promontory of Biarritz ends in a projection known as the Atalaye, crowned by the ruins of a castle and surrounded by rocky islets. Some of these are united to the mainland and to each other by jetties which curve round so as to form the Port de refuge, a haven available only in fair weather. South-west of the Atalaye lies the Port-Vieux, a sheltered cove now used only as a bathing-place. The Port des Pêcheurs, the principal of the three harbours, is on the south-east side of the Atalaye and is that most used by the fishermen of the town. Biarritz is the home of the boulangerie, or baker, and biscuit-factory, and though fishing is the only industry; Biarritz depends for its prosperity on the visitors who are attracted by its mild climate and the
bathing. The season is almost continuous; in the winter the English, in the summer Russians, Spaniards and French fill the hotels of the town. Among its attractions is a golf club, established in 1888, with a course of 18 holes.

BIAS of Priene in Ionia, one of the so-called Seven Sages of Greece, son of Teutamus, flourished about 570 B.C. He was famous for his patriotism, the nobility of his character and his eloquence. A number of gnomes or aphorisms are attributed to him, which may be found collected in F. W. A. Mullach, Fragmenta Philosophorum Graecorum (1860). He is said to have written a poem on the best means of making Ionia prosperous. His advice to its inhabitants, at the time of the Persian invasion, to migrate to Sardinia and there found a single pan-Tionic city (Herodotus i. 170), has generally been regarded as historical. One much-quoted saying of his may be mentioned. When his native town was besieged by the enemy, the inhabitants resolved to escape with their most valuable belongings. One of them seeing BIAS without anything, advised him to follow the example of the rest. "I am doing so," said he, "for I carry all my belongings with me" (omnia mea mecum porto). He was honoured with a splendid funeral, and a sanctuary called Teutamium was dedicated to him.

See Bohren, De Septem Sapientibus (1860).

BIAS (from the Fr. bias, of unknown origin; the derivation from Lat. bifas, two-faced, is wrong), something oblique or slanting. The term is used especially of a piece of cloth cut obliquely across the texture, or of a seam of two such pieces brought together; in the game of bowls (q.v.) it is applied alike to the one-sided construction of the bowl, flattened on one side and protruding on the other, and to the slanting line the bowl takes when thrown. The figurative sense of the word, prejudice or undue leaning to one side of a subject, is derived from this bowling term.

BIBACULUS, MARCUS FURIUS. Roman poet, flourished during the last century of the republic. According to Jerome, he was born at Cremona in 103 B.C., and probably lived to a great age. He wrote satirical poems after the manner of Catullus, whose bitterness he rivalled, according to Quintilian (Instit. x. r. 196), in his iambics. He even attacked Augustus (and perhaps Caesar), who treated the matter with indifference. He was also author of prose Lucubrations and perhaps of an epic poem on Caesar’s Gallic wars (Pragmatia Belli Gallici). Otto Ribbeck attributes to him one of the shorter poems usually assigned to Virgil. It is doubtful whether he is the person ridiculed by Horace (Satires, ii. 5. 40) and whether he is identical with the turgidus Alpinus (Satires, i. 10. 36), the author of an Aethiops dealing with the life and death of Memnon and of a poem on the Rhine. Some critics, on the ground that Horace would not have ventured to attack so dangerous an adversary, assume the existence of a real person named Furius (or Corinna) Alpinus. BIBACULUS was ridiculed for his high-flown and exag- gerated, style and manner of expression.

See Weichert, “De M. Furio Bibaco,” in his Poetarum Latinum Reliquiae (1830); fragments in L. Müller’s edition of Catul·lus in the Teubner Series (1870).

BIBER, HEINRICH JOHANN FRANZ VON (1644-1704), German violinist and composer, was for some time musical conductor at Salzburg, and was ennobled by the emperor Leopold in 1675. He is regarded as the greatest of the important German composers for the violin, his works including sonatas and church music.

BIBERACH, a town of Germany, in the kingdom of Württemberg, on the Riss, a small affluent of the Danube, 22 m. S.S.W. from Ulm. Pop. (1900) 3800. It is still surrounded by medieval walls and towers, and is strikingly picturesque. Its principal church dates from the 12th century, and it possesses a hospital with rich endowments. Its man industries are cloth, bell- casting, toys and zinc wares, and its fruit markets are famous. Biberaach appears as a village in the 9th century, and in 1311 it became a free imperial city. During the Thirty Years’ War it underwent various vicissitudes, and was for a while held by the Swedes. In 1707 it was captured and put to ransom by the French, who afterwards, in 1706 and 1800, defeated the Austrians in the neighbourhood. In 1803 the city was deprived of its imperial freedom and assigned to Baden, and in 1860 was transferred to Württemberg. Biberaach is the birthplace of the sculptor Johann Lorenz Natter (1705-1763) and the painter Bernard Neher (1806-1886); Christopht Martin Wieland, born in 1733 at the neighbouring village of Oberholzheim, spent several years in the town.

BIBIRINE, or BIBIRINE, CaH2NO3, an alkaloid obtained from the bark and fruit of the greenheart (q.v.) tree, Nectandra rodiei, called bibiru ou sipiri in Guiana, where the tree grows. The substance was discovered about the year 1835 by Hugh Rodie, a surgeon in Demerara, who used it as a febrifuge in substitution for quinine.

BIble. The word “Bible,” which in English, as in medieval Latin, is treated as a singular noun, is in its original Greek form a plural, Ἐνδιαφάνεια, the (sacred) book—correctly expressing the fact that the sacred writings of Christendom (collectively described by this title) are made up of a number of independent records, which set before us the successive stages in the history of revelation. The origin of each of these records forms a distinct critical problem, and for the discussion of these questions of detail the reader is referred to the separate articles on the Biblical books. An account of the Bible as a whole involves so many aspects of interest, that, apart from the separate articles on its component books, the general questions of importance arising out of its present shape require to be discussed in separate sections of this article. The Bible is divided into two main divisions:—(A) Old Testament, and (B) New Testament; and under each of these are treated (i) the Canon, (ii) the texts and versions, (iii) textual criticism, (iv) the “higher criticism,” i.e. a general historical account (more particularly considered for separate books in the articles on them) of the criticism and views based on the substance and matter, as apart from criticism devoted to the correction and elucidation of the text, and (v) chronology. For the literary history of the translated English Bible, see the separate article under Bible, English.

(A) Old Testament

1. Canon.

We shall begin by giving a general account of the historical and literary conditions under which the unique literature of the Old Testament sprang up, of the stages by which it gradually reached its present form, and (so far as this is possible) of the way in which the Biblical books were brought together in a canonical collection. There exists no formal historical account of the formation of the Old Testament canon. The popular idea that this canon was formed by Ezra has no foundation in antiquity. Certainly in the apocryphal book of 2 Esdras, written towards the end of the 1st century A.D., we read (xiv. 20-26, 35-48), that, the law being burnt, Ezra, at his own request, was miraculously inspired to rewrite it; he procured accordingly five skilled scribes, and dictated to them for forty days, during which time they wrote 94 books, i.e. not only (according to the Jewish reckoning) the 24 books of the Old Testament, but 70 apocryphal books as well, which, being filled, is said, with a superior, or esoteric wisdom, are placed upon even a higher level (vv. 43-47) than the Old Testament itself. No argument is needed to show that this legend is unworthy of credit; even if it did deserve to be taken seriously, it still contains nothing respecting either a completion of the canon, or even a collection, or redaction, of sacred books by Ezra. Yet it is frequently referred to by patristic writers; and Ezra, on the strength of it, is regarded by them as the genuine restorer of the lost books of the Old Testament (see Ezra).

In 2 Mac. ii. 13 it is said that Nehemiah, “founding a library, gathered together the things concerning the kings and prophets, and the (writings) of David, and letters of kings about sacred gifts.” These statements are found in three divided according to their
to being possibly the books of Samuel and Kings and some of the Prophets, a part of the Psalter, and documents such as those excerpted in the book of Ezra, respecting edicts issued by Persian kings in favour of the Temple. But obviously nothing definite can be built upon a passage of this character.

The first traces of the idea current in modern times that the canon of the Old Testament was closed by Ezra are found in the 13th century a.d. From this time, as is clearly shown by the series of quotations in Ryle's Canon of the Old Testament, p. 257 ff. (and ed., p. 260 ff.), the legend—for it is nothing better—grew, until finally, in the hands of Elias Levi (1538), and especially of Johannes Buxtorf (1665), it assumed the form that the "men of the Great Synagogue,"—a body the real existence of which is itself very doubtful, but which is affirmed in the Talmud to have "written" (!) the books of Ezekiel, the Minor Prophets, Daniel and Esther—with Ezra as president, first collected the books of the Old Testament into a single volume, restored the text, where necessary, from the best MSS., and divided the collection into three parts, the Law, the Prophets and "the Writings" (the Hagiographa). The reputation of Elias Levi and Buxtorf led to this view of Ezra's activity being adopted by other scholars, and so it acquired general currency. But it rests upon no authority in antiquity whatever.

The statement just quoted, however, that in the Jewish canon the books of the Old Testament are divided into three parts, though the arrangement is wrongly referred to Ezra, is in itself both correct and important. "The Law, the Prophets and the Writings (i.e. the Hagiographa)" is the standing Jewish expression for the Old Testament; and in every ordinary Hebrew Bible the books are arranged accordingly in the following three divisions:

1. The Tûrâh (or "Law"), corresponding to our "Penta-teuch" (5 books).
2. The "Prophets," consisting of eight books, divided into two groups:
   (a) The "Former Prophets"; Joshua, Judges, Samuel; Kings.
   (b) The "Latter Prophets"; Isaiah, Jeremiah, Ezekiel, the Minor Prophets (called by the Jews "the Twelve," and counted by them as one book).
3. The "Writings," also sometimes the "Sacred Writings," i.e., as we call them, the "Hagiographa," consisting of three groups, containing in all eleven books:
   (a) The poetical books, Psalms, Proverbs, Job.
   (b) The five Megillah (or "Rolls")—grouped thus together in later times, on account of the custom which arose of reading them in the synagogues at five sacred seasons—Song of Songs, Ruth, Lamentations, Ecclesiastes, Esther.
   (c) The remaining books, Daniel, Ezra and Nehemiah (forming one book), Chronicles.

There are thus, according to the Jewish computation, twenty-four "books" in the Hebrew canon. The threefold division of the canon just given is recognized in the Talmud, and followed in all Hebrew MSS., the only difference being that the books included in the Latter Prophets and in the Hagiographa are not always arranged in the same order. No book, however, belonging to one of these three divisions is ever, by the Jews, transferred to another. The expansion of the Talmudic twenty-four to the thirty-nine Old Testament books of the English Bible is effected by reckoning the Minor Prophets one by one, by separating Ezra from Nehemiah, and by subdividing the long books of Samuel, Kings and Chronicles. The different order of the books in the English Bible is due to the fact that when the Hebrew Bible was translated into Greek between the 3rd and 1st centuries B.C., the Hebrew triplepartite division was disregarded, and the books (including those now known as the "Apocrypha") were grouped mostly by subjects, the historical books being placed first (Genesis—Esther), the poetical books next (Job—Song of Songs), and the prophetic books last (Isaiah—Malachi).

1 The books of Samuel, Kings, Ezra and Nehemiah, and Chronicles, were by the Jews each treated (and written) as one book, and were not divided by them into two till the 16th century, through Christian influence.

Substantially the same order was followed in the Vulgate. The Reformers separated the books which had no Hebrew original (i.e. the Apocrypha) from the rest, and placed them at the end; the remaining books, as they stood in the Vulgate, were then in the order which they still retain in the English Bible.

The tripartite division of the Hebrew canon thus recognized by Jewish tradition can, however, be traced back far beyond the Talmud. The Proverbs of Jesus, the son of Sirach (c. 200 B.C.), known to the Roman world under the name of the "Wisdom of Solomon," were translated into Greek by the grandson of the author at about 130 B.C.; and in the preface prefixed by him to his translation he speaks of "the law, and the prophets, and the other books of our fathers," and again of "the law, and the prophets, and the rest of the books," expressions which point naturally to the same threefold division which was afterwards universally recognized by the Jews. The terms used, however, do not show that the Hagiographa was already completed, as we now have it; it would be entirely consistent with them, if, for instance, particular books, as between Esther, or Daniel, or Ecclesiastes, were only added to the collection subsequently. Another allusion to the tripartite division is also no doubt to be found in the expression "the law, the prophets, and the psalms," in Luke xxiv. 44. A collection of sacred books, including in particular the prophets, is also referred to in Dan. ix. 2 (R.V.), written about 166 B.C.

This threefold division of the Old Testament, it cannot reasonably be doubted, rests upon an historical basis. It represents three successive stages in the history of the collection. The Law was the first part to be definitely recognized as authoritative, or canonical; the "Prophets" (as defined above) were next accepted as canonical; the more miscellaneous collection of books comprised in the Hagiographa was recognized last. In the absence of all external evidence respecting the formation of the canon, we are driven to internal evidence in our endeavour to fix the dates at which these three collections were thus canonized, and internal evidence points to the conclusion that the Law could scarcely have been completed, and accepted formally, as a whole, as canonical before 444 B.C. (cf. Neb. viii.—x.); that the "Prophets" were completed and so recognized about 250 B.C., and that the Hagiographa, about 150 and 100 B.C. (See further Ryle's Canon of the Old Testament.)

Having thus fixed approximately the terminus ad quem at which the Old Testament was completed, we must now begin at the other end, and endeavour to sketch in outline the process by which it gradually reached its completed form. And here it will be found to be characteristic of nearly all the longer books of the Old Testament, and in some cases even of the shorter ones as well, that they were not completed by a single hand, but that they were gradually expanded, and reached their present shape by a process of accumulation.

Among the Hebrews, as among many other nations, the earliest beginnings of literature were in all probability poetical. At least the opening phrases of the song of Moses in Exodus xv.; the song of Deborah in Judges v.; the fragment from the "Book of the Wars of Yahweh," in Numbers xxi. 14, 15; the war-ballad, celebrating an Israelitish victory, in Numbers xxii. 27-30; the extracts from the "Book of Jashar" (or "of the Upright," no doubt a title of Israel) quoted in Joshua x. 12, 13 ("Sun, stand thou still upon Gibeon, &c."); in 2 Sam. i. (David's elegy over Saul and Jonathan); and, very probably, in the Septuagint Kings. xiii. 13 (Sept. xii.), as the opening of the poetical fragment in vv. 12, 13, describing Solomon's building of the Temple, show how great national occurrences and the deeds of ancient Israelitish heroes stimulated the national genius for poetry, and evoked lyric songs, suffused with religious feeling, by which their memory was perpetuated. The poetical descriptions of the character, or geographical position, of the various tribes, now grouped together as the Blessings of Jacob (Gen. xlvi.) and Moses (Deut. xxxiii.), may be mentioned at the same time. These poems, which are older, and in most cases considerably older, than the narratives in which they are now embedded, if they were collected into books, must have been fairly numerous,
and we could wish that more examples of them had been preserved.

The historical books of the Old Testament form two series: one, consisting of the books from Genesis to 2 Kings (exclusive of Ruth, which, as we have seen, forms in the Hebrew canon part of the Psalter—prophal), excepting the period from the Conquest to the destruction of Jerusalem by the Chaldeans in 586 B.C.; the other, comprising the books of Chronicles, Ezra and Nehemiah, beginning with Adam and ending with the second visit of Nehemiah to Jerusalem in 432 B.C. These two series differ from one another materially in scope and point of view, but in one respect they are both constructed upon a similar plan; no entire book in either series consists of a single, original work; but older writings, or sources, have been combined by a compiler—or sometimes, in stages, by a succession of compilers—in such a manner that the points of juncture are often clearly discernible, and the sources are in consequence capable of being separated from one another. The authors of the Hebrew historical books, as we now have them, do not, as a rule, as a modern author would do, rewrite the matter in their own language; they excerpt from pre-existing documents such passages as are suitable to their purpose, and incorporate them in their work, sometimes adding at the same time matter of their own. Hebrew writers, however, exhibit usually such strongly marked individualities of style that the documents or sources, thus combined, can generally be distinguished from each other, and from the comments and modern additions of the compiler without difficulty. The literary differences are, moreover, often accompanied by differences of treatment, or representation of the history, which, where they exist, confirm independently the conclusions of the literary analysis. Although, however, the historical books generally are constructed upon similar principles, the method on which these principles have been applied is not quite the same in all cases. Sometimes, for instance, the excerpts from the older documents form long and complete narratives; in other cases (as in the account of the Flood) they consist of a number of short passages, taken alternately from two or more narratives, and of detailed narratives within a general narrative. In the books of Judges and Kings the compiler has fitted together a series of older narratives in a framework supplied by himself; the Pentateuch and book of Joshua (which form a literary whole, and are now often spoken of together as the Hexateuch) have passed through more stages than the books just mentioned, and their literary structure is more complex.

The Hexateuch (Gen.—Josh.).—The traditions current among the Israelites respecting the origins and early history of their nation—the patriarchal period, and the times of Moses and Josue—were probably first cast into a written form in the 10th or 9th century B.C. by a prophet living in Judah, who, from the almost exclusive use in his narrative of the sacred name "Jahveh" ("Jehovah"),—or, as we now commonly write it, Yahweh,—is referred to among scholars by the abbreviation "J." This writer, who is characterized by a singularly bright and picturesque style, and also by deep religious feeling and insight, begins his narrative with the account of the creation of man from the dust, and tells of the first sin and its consequences (Gen. ii. 4—11. 24); then he gives an account of the early growth of civilization (Gen. iv.), of the Flood (parts of Gen. vi.—viii.), and the origin of distinct languages (Gen. xi.—xii.); afterwards in a series of vivid pictures he gives the story, as tradition told it, of the patriarchs, of Moses and the Exodus, of the journey through the wilderness, and the conquest of Canaan. It would occupy too much space to give here a complete list of the passages belonging to "J"; but examples of his narrative (with the exception here and there of a verse or two belonging to one of the other sources described below) are to be found, for instance, in Gen. xii., xiii., xvii.—xix. (the visit of the three angels to Abraham, and the judgment on Sodom and Gomorrah), xxiv. (Abraham’s servant sent to find a wife for Isaac), xxvii. 1—45 (Jacob’s meeting with his father’s blessing), xxviii. 10—22, xxxi. 10—45, xxxii. 20—29, xxxiii. 7, x. 1—11, xxxii. 12—xxxiv. 26 (including, in xxxiv. 17—26, a group of regulations, of a simple, undevolved character, on various religious observances); Num. x. 29—36, and most of Num. vii.

Somewhat later than "J," another writer, commonly referred to as "E," from his preference for the name Elohim ("God") rather than "Jehovah," living apparently in the northern kingdom, wrote down the early history of the Israelites as they were current in northern Israel, in a style resembling generally that of "J," but not quite as bright and vivid, and marked by small differences of expression and representation. The first traces of "E" are found in the life of Abraham, in parts of Gen. xv.; examples of other passages belonging to this source are:—Gen. xx. 17—xxi. 8—32, xxii. 1—14, xl.—xlv. and xxvi. (except a few isolated passages); Ex. xviii., xx.—xxxii. (including the dialogue—in its original, terser form, without the explanatory additions now attached to several of the commandments—and the collection of laws, known as the "Book of the Covenant," in xxi.—xxxii., xxxiii. 7—11; Num. xii., most of Num. xxxii.—xxxiv. (the history of Balaam); Josh. xxiv. "E" thus covers substantially the same ground as "J," and gives often a parallel, though somewhat divergent, version of the same events. The laws contained in Ex. xx. 13—xxii. 10 were no doubt taken by "E" from a pre-existing source; with the regulations referred to above as incorporated in "J" (Ex. xxiv. 17—26), they form the oldest legislation of the Hebrews that we possess; they consist principally of civil ordinances, suited to regulate the life of a community living, under simple conditions of society, and chiefly occupied in agriculture, but partly also of elementary regulations respecting religious observances (altars, sacrifices, festivals, &c.).

Not long, probably, after the fall of the northern kingdom in 722 B.C., a prophet of Judah conceived the plan of compiling a comprehensive history of the traditions of his people. For this purpose he selected extracts from the two narratives. "J" and "E," and combined them together into a single narrative, introducing in some places additions of his own. This combined narrative is commonly known as "JE." As distinguished from the narrative formerly known as "J," and combining the religious ideas characteristic of the prophets often find expression in it. Most of the best-known narratives of the patriarchal and Mosaic ages belong to "JE." His style, especially in the parts belonging to "J," is graphic and picturesque, the descriptions are vivid and abound in detail and colloquy, and both emotion and religious feeling are warmly and sympathetically expressed in it.

Deuteronomy.—In the 7th century B.C., during the reign of King Josiah, a new and more efficient effort was made to bring the people of "JE" was enlarged by the addition of the discourses of Deuteronomy. These discourses purport to be addresses delivered by Moses to the assembled people, shortly before his death, in the land of Moab, opposite to Jericho. There was probably some tradition of a farewell address delivered by Moses, and the writer of Deuteronomy gave this tradition form and substance. In impressive and persuasive oratory he sets before Israel, in a form adapted to the needs of the age in which he lived, the fundamental principles which Moses had taught. Yahweh was Israel’s only god, who tolerated no other god beside Himself, and who claimed to be the sole object of the Israelites’ reverence. This is the fundamental thought which is insisted on and developed in Deuteronomy with great eloquence and power. The truths on which the writer loves to dwell are the sole godhead of Yahweh. His spirituality (ch. iv.), His choice of Israel, and the love and faithfulness which He had shown towards it, by redeeming it from slavery in Egypt, and planting it in a free and fertile land; from which are deduced the great practical duties of loyal and loving devotion to Him, an uncompromising repudiation of all false gods, the rejection of all heathen practices, a cheerful and ready obedience to His will, and a warm-hearted and loving attitude towards man. Love of God is the primary spring of human duty (vi. 5). In the course of his argument (especially in chs. xii.—xxvi.), the writer takes up most of the laws, both civil
and ceremonial, which (see above) had been incorporated before in “J” and “E,” together with many besides which were current in Israel; these, as a rule, he expands, applies or enforces with motives; for obedience to them is not to be rendered merely in deference to external authority, it is to be prompted by right moral and religious motives. The ideal of Deuteronomy is the community of which every member is full of love and reverence towards his God, and of sympathy and regard for his fellow-men. The “Song” (Deut. xxxii.) and “Blessing” (Deut. xxxiii.) of Moses are not by the author of the discourses; and the latter, though not Mosaic, is of considerably earlier date.

The influence of Deuteronomy upon subsequent books of the Old Testament is very perceptible. Upon its promulgation it speedily became the book which both gave the religious ideals of the age, and moulded the phraseology in which these ideals were expressed. The style of Deuteronomy, when once it had been formed, lent itself readily to imitation; and thus a school of writers, imbued with its spirit, and using its expressions, quickly arose, who have left their mark upon many parts of the Old Testament. In particular, the parts of the combined narrative “JE,” which are now included in the book of Joshua, passed through the hands of a Deuteronomic editor, who made considerable additions to them—chiefly in the form of speeches placed, for instance, in the mouth of Joshua, or expansions of the history, all emphasizing principles inculcated in Deuteronomy and expressed in its characteristic phraseology (e.g. most of Josh. i., ii. 10-11, iii. 2-4, 6-9, x. 28-43, xi. 10-23, xii. 1-8, xiii. 8-12, xiii.). From an historical point of view it is characteristic of these additions that they generalize Joshua’s successes, and represent the conquest of Canaan, effected under his leadership, as far more complete than the earlier narratives allow us to suppose was the case. The compilers of Judges and Kings are also (see below) strongly influenced by Deuteronomy.

The Priestly sections of the Hexateuch (known as “P”) remain still to be considered. That these are later than “JE,” and even than Deut., is apparent, not to mention but one feature—from the most various ritual and biblical medical and legal which they exhibit. They are to all appearance the work of a school of priests, who, after the destruction of the Temple in 586 B.C., began to write down and codify the ceremonial regulations of the pre-exilic periods, combining them with an historical narrative extending from the Creation to the establishment of Israel in Canaan; and who completed their work during the century following the restoration in 537 B.C. The chief object of these sections is to describe in detail the leading institutions of the theocracy (Tabernacle, sacrifices, purifications, &c.), and to render them in a distinctive fashion in the Mosaic age. The history as such is subordinate; an exception is the pastoral chronicle which is given only in brief summaries (e.g. Gen. xix. 29, xli. 46). Statistical data (lists of names, genealogies, and precise chronological notes) are a conspicuous feature in it. The legislation of “P,” though written down in or after the exile, must not, however, be supposed to be the creation of that period; many elements in it can be shown from the older literature to have been of great antiquity in Israel; it is, in fact, based upon pre-exilic Temple usage, though in some respects it is a development of it, and exhibits the form which the older and simpler ceremonial institutions of Israel ultimately assumed. In “P’s” picture of the Mosaic age there are many ideal elements; it represents the priestly ideal of the past rather than the past as it actually was. The following examples of passages from “P” will illustrate what has been said—Gen. i. 1-ii. 4, xvii. (institution of circumcision), xxii. (purchase of the cave of Machpelah), xxv. 7-17, xvi. 6-27; Ex. vi. 2-vii. 13, xxv.-xxxii. (directions for making the Tabernacle, its vessels, dress of the priests, &c.), xxxv-xl. (execution of these directions); Lev. (the whole); Num. i. 1-x. 28 (census of people, arrangement of camp, and distribution of Levites, &c); Lev. v. 1-27, xxvi.-xxxii. (distribution of the land among the different tribes), xxi. 1-42.

The style of “P” is strongly marked—as strongly marked, in fact, as (in a different way) that of Deuteronomy is; numerous expressions not found elsewhere in the Hexateuch occur in it repeatedly. The section Lev. xvii.-xxvi. has a character of its own; for it consists of a substratum of older laws, partly moral (chs. xviii.-xx. mostly), partly ceremonial, with a hortatory conclusion (ch. xxvi.), with certain very marked characteristics (from or of which it has received the nomenclature of the “Law of Holiness”), which have been combined with elements belonging to, or conceived in the spirit of, the main body of “P.”

Not long after “P” was completed, probably in the 4th century B.C., the whole, consisting of “JE” and Deuteronomy, was combined with it; and the existing Hexateuch was thus produced.

Judges, Samuel and Kings.—The structure of these books is simpler than that of the Hexateuch. The book of Judges consists substantially of a series of older narratives, arranged together by a compiler, and provided by him, where he deemed it necessary, with introductory and concluding commentaries (e.g. i. ii. 11-iii. 6, iii. 12-15, 30, iv. 1-3, 23, 24, v. 1-3). The compiler is strongly imbued with the spirit of Deuteronomy; and the object of his comments is partly to exhibit the chronology of the period as he conceived it, partly to state his theory of the religious history of the time. The compiler will not have written before c. 600 B.C.; the narratives incorporated by him will in most cases have been considerably earlier. The books of Samuel centre round the names of Samuel, Saul and David. They consist of a series of narratives, or groups of narratives, dealing with the lives of these three men, arranged by a compiler, who, unlike Deuteronomist, allows his own hand to appear. Some of these narratives are to all appearance nearly contemporary with the events that they describe (e.g. 1 Sam. i. 1-16, xi. 1-11, 15, xiiii. xiv., xxi-xxii.; 2 Sam. i. xx.-xxii.; others are later). In 1 Sam. the double (and discrepant) accounts of the appointment of Saul as king (i. x. 16, xi. 1-15, 15, and viii., x. 17-27, xlix.), and of the introduction of David to the history (xvi. 14-23 and xvii. r.-xviii. 5) are noticeable; in ix. i-x. 16, xi. 1-11, 15, the monarchy is viewed as God’s gracious gift to His people; in viii., x. 17-27, xlix., which reflect the influence of a much later date, the monarchy is viewed unfavourably, and represented as granted by God unwillingly. The structure of the book of Kings resembles that of Judges. A number of narratives, evidently written by prophets, and in many of which also (as those relating to Elijah, Elisha and Isaiah) prophets play a prominent part, and a series of short statistical notices, relating to political events, and derived probably from the official annals of the two kingdoms (which are usually cited at the end of a king’s reign), have been arranged together, and sometimes expanded at the same time, in a framework supplied by the compiler. The framework is repeated, as recognized by a historical critic, with great chronological details, references to authorities, and judgments on the character of the various kings, especially as regards their attitude to the worship at the high places, all cast in the same literary mould, and marked by the same characteristic phraseology. Both in point of view and in phraseology the compiler shows himself to be strongly influenced by Deuteronomy. The two books appear to have been substantially completed before the exile; but short passages were probably introduced into them afterwards. Examples of passages due to the compiler: Judges xi. 33-34; x. 1-26, i. 27-31; 2 Kings ii. 5-25; iii. 7-27, 17-25; iv. 22-27; v. 12-15, 25; 16-25, 29-31, xv. 1-5, xii. 20-26; 2 Kings ix. 7-19, xii. 7-23.

The Latter Prophets.—Isaiah, Jeremiah, Ezekiel, the Twelve. The writings of the canonical prophets form another important element in the Old Testament, also, like the historical books, of gradual growth. Beginning with Amos and Hosea, they form a series which was not completed till more than three centuries had passed away. The activity of the prophets was largely called forth by crises in the national history. They were partly moral reformers, partly religious teachers, partly political agitators. They held a variety of attitudes towards human duty, of religious truth and of national policy. They expanded and developed, and applied to new situations and
circumstances of the national life, the truths which in a more ger- 
manal form they had inherited from their ancestors. The 
nature and attributes of God; His gracious purposes towards 
man; the relation of man to God, with the practical conse-
quences that follow from it; the true nature of religious service; 
the call to repentance and the conditions of God's favour; the 
ideal of character and action which each man should pursue, 
before himself; human duty under its various aspects; the 
responsibilities of office and position; the claims of mercy and 
philanthropy, justice and integrity; indignation against the 
oppression of the weak and the unprotected; ideals of a blissful 
future, when the troubles of the present will be over, and men 
will bask in the enjoyment of righteousness and felicity,—these, 
and such as these, are the themes which are ever in the prophets' 
mouths, and on which they enlarge with unwearying eloquence 
and power.

For the more special characteristics of the individual prophets, 
reference must be made to the separate articles devoted to each; 
it is impossible to do more here than summarize briefly the 
literary structure of their various books.

Isaiah.—The book of Isaiah falls into two clearly distinguished 
parts, viz. chs. i.-xxix., and xl.-lvii. Chs. xl.-lvii., how-
ever, are not by Isaiah, but are the work of a prophet who 
worked about 740 B.C., shortly before the conquest of Babylon 
by Cyrus, and whose aim was to encourage the Israelites in 
exile, and assure them of the certainty of their approaching 
restoration to Canaan. (According to many recent critics, this 
prophet wrote only chs. xl.-lv., chs. lvi.-lxxvi. being added 
subsequently, some time after the return.) The genuine 
prophecies of Isaiah are contained in chs. i.-xxx., xiv. 24-xxii., 
xxviii.-xxxiii., xxvii. 22-32,—all written between 740 and 
700 B.C. (or a little later), and all (except ch. vi.) having reference 
to the condition of Judah and Israel, and the movements of 
the Assyrians during the reigns of Ahaz and Hezekiah. The opinion 
has, however, latterly gained ground that parts even of these 
chapters are of later origin than Isaiah's own time. Of the rest of 
chs. i.-xxix., this is generally admitted. Thus chs. i.- 
xxiv. 23, xxxi. 1-10, xxxii.-xxxv. belong to the same age as 
chs. xl.-lv., xliii. xiv. 23, and xxxii. 1-10, looking forward 
similarly to the approaching fall of Babylon; chs. xxxiv.-xxxvii. 
have a character of their own, and form an apocalypse written 
not earlier than the 5th century B.C.; chs. xxxvi.-xxxix., 
describing incidents in which Isaiah took a part, consist of 
narratives excerpted from 2 Kings xviii. 13-xx. with the addition of 
Hezekiah's song (xxxviii. 9-20). It is evident from these 
facts that the book of Isaiah did not assume its present form 
till considerably after the return of the Jews from exile in 537, 
when the conditions of life were more distinctly defined than 
the prophecies of Isaiah which had come to his hands, together with 
others which at the time were attributed to Isaiah, and gave 
the book its present form.

Jeremiah.—Jeremiah's first public appearance as a prophet 
was in the 13th year of Josiah (Jer. i. 2, xxv. 3), i.e. 626 B.C., 
and his latest prophecy (ch. xliv.) was delivered by him in 
Egypt, whither he was carried, against his will, by some of the 
Jews who had been left in Judah, shortly after the fall of Jeru-
salem in 586. Jeremiah was keenly conscious of his people's 
sin; and the aim of most of his earlier prophecies was to bring 
his countrymen, if possible, to a better mind, in the hope that 
thereby the doom which he sees impending may be averted— 
an end which eventually he saw clearly to be unattainable. 
Jeremiah's was a sensitive, tender nature; and he lamented, with 
great pathos and emotion, his people's sins, the ruin to which 
he saw his country hastening, and the trials and persecutions 
which his predictions of disaster frequently brought upon him. 
A large part of his book is biographical, describing various in-
cidents of his ministry. Prophecies of restoration are contained 
in chs. xxx.-xxxiii. The prophecies of the first twenty-three 
years of his ministry, as we are expressly told in ch. xxxvi., 
were for the most part written 604 B.C. by his friend and amanuensis 
Baruch, and the roll thus formed must have formed the nucleus 
of the present book. Some of the reports of Jeremiah's pro-
phesies, and especially the biographical narratives, also probably 
have Baruch for their author. But the chronological disorder of 
the book, and other indications, show that Baruch could not 
have been the compiler of the book, but that the prophecies 
and narratives contained in it were collected together gradually, 
and that it reached its present form by a succession of stages, 
the last of which was completed till long after Israel's return from 
Babylon. The long prophecy (Jer. ch. lii.), announcing 
the approaching fall of Babylon, is not by Jeremiah, and cannot 
have been written till shortly before 538 B.C.

Ezekiel.—Ezekiel was one of the captives who were carried 
with Jehoiachin in 597 B.C. to Babylonia, and was settled with 
many other exiles at a place called Tel-ahib (iii. 15). His pro-
phesies (which are regularly dated) are assigned to various 
years from 592 to 570 B.C. The theme of the first twenty-four 
chapters of his book is the impending fall of Jerusalem, which 
took place actually in 586, and which Ezekiel foretells in a series 
of prophecies, distinguished by great variety of symbolism 
and imagery. Chs. xxv.-xxxii. are on various foreign 
nations, Edom, Tyre, Egypt, &c. Prophecies of Israel's future 
restoration follow in chs. xxxiii.-xlvi., chs. xl.-xlvi. being 
remarkable for the minuteness with which Ezekiel describes 
the organization of the restored community, as he would 
think it realized, including even such details as the measurements 
and other arrangements of the Temple, the sacrifices to be 
ofered in it, the duties and revenues of the priests, and the redistribu-
tion of the land among the twelve tribes. The book of 
Ezekiel bears through and through the stamp of the prophetic 
prophecies contained in it are arranged methodically; and to all 
appearance—in striking contrast to the books of Isaiah and 
Jeremiah—it received the form in which we still have it from 
the prophet himself.

The Twelve Minor Prophets.—These, as was stated above, 
were reckoned by the Jews as forming a single "book." The 
two earliest of the Minor Prophets, Amos and Hosea, prophesied 
in the northern kingdom, at about 760 and 740 B.C. respectively; 
both foretold the approaching ruin of northern Israel at the 
hands of the Assyrians, which took place in fact when Sargon 
took Samaria in 722 B.C.; and both did their best to stir their 
people to better things. The dates of the other Minor 
Prophets (in some cases approximate) are: Micah, c. 725-720 B.C. 
(some passages perhaps later); Zephaniah, c. 652; Nahum, 
shortly before the destruction of Nineveh by the Manda in 607; 
Habakkuk (on the rise and destiny of the Chaldaean empire) 
603-600; Obadiah, after the destruction of Jerusalem by the 
Chaldaens in 586; Haggai, 520; Zechariah, i.-vii. (as in 
Haggai, promises and encouragements connected with the re-
building of the Temple) 520 and 518; Malachi, c. 440-400; 
Joel, 5th century B.C. Jonah, 4th century B.C. The latest 
prophecies in the book are, probably, those contained in 
Zech. ix.xiv. which reflect entirely different historical conditions 
from Zech. i.-vii. (520 and 518 B.C.), and may be plausibly 
assigned to the period beginning with the conquests of Alexander 
the Great, between 332 and 300 B.C. Why these prophecies 
were attached to Zech. i.-vii. must remain matter of conjecture; 
but there are reasons for supposing that, together with the 
prophecy of Malachi, they came to the compiler of the book 
"from " without any connection with the events that were 
then in progress.

The Psalms.—The Psalter is that part of the Old Testament 
in which the devotional aspect of the religious character finds 
its complete expression; and in lyrics of exquisite tenderness 
and beauty the most varied emotions are poured forth by the 
psalmists to their God—dependency and distress, penitence 
and resignation, hope and confidence, jubilation and thankful-
ness, adoration and praise. The Psalter, it is clear from many 
indications, is not the work of a single compiler, but was formed 
gradually. A single compiler is not likely to have introduced 
double recensions of one and the same psalm (as Ps. liii. = 
Ps. xiv., Ps. lxx = Ps. xi, 13-17, Ps. cviii. = Ps. lii. 7-11 + 
lx. 5-14); in the Hebrew canon the Psalter is composed of five
books (i.-xii., xiii.-xxii., xxiii.-lxxix., xc-cvi., cvii.-cl.); and in many parts it is manifestly based upon independent smaller collections; for it contains groups of psalms headed "David," the "sons of Korah," "Asaph," "Songs of Ascents." Each of the five books of which it is composed contains psalms which also complete a problem of human life following the return from the Captivity; and indeed, when the individual psalms are studied carefully it becomes apparent that in the great majority of cases they presuppose the historical conditions, or the religious experiences, of the ages that followed Jeremiah. Thus, though it is going too far to say that there are no pre-exilic psalms, the Psalter, as a whole, is the expression of the deeper spiritual feeling which marked the later stages of Israel's history. It has been not inaptly termed the Hymn-book of the second Temple. Its compilation can hardly have been finally completed before the 1st century B.C.; if it is true that many scholars think, that there are psalms dating from the time of the Maccabean struggle (Ps. lxi., lxiv., lxix., lxxiii., and perhaps others), it cannot have been completed till after 162 B.C.

The Book of Proverbs.—This is the first of the three books belonging to the "Wisdom-literature" of the Hebrews, the other two books being Job and Ecclesiastes. The Wisdom-literature of the Hebrews concerned itself with what we should call the philosophy of human nature, and sometimes also of physical nature as well; its writers observed human character, studied action in its consequences, laid down maxims for education, and reflected on the moral problems of the human society presents. The book of Proverbs consists essentially of generalizations on human character and conduct, with (especially in chs. 1.-ix.) moral exhortations addressed to an imagined "son" or pupil. The book consists of eight distinct portions, chs. i.-ix. being introductory, the proverbs, properly so called, beginning at x. 1 (with the title "The Proverbs of Solomon") and other, shorter collections, beginning at xxii. 17, xxiv. 23, xxv. 1, xxx. 1, xxxi. 1, xxxii. 10 respectively. The book, it is evident, was formed gradually. A small nucleus of the proverbs may be Solomon's; but the great majority represent no doubt the generalizations of a long succession of "wise men." The introduction, or "Praise of Wisdom," as it has been called (chs. 1.-ix.), commending the maxims of Wisdom as a guide to the young, will have been added after most of the rest of the book was already complete. The book will not have finally reached its present form before the 4th century B.C. Some scholars believe that it dates entirely from the Greek period (which began 332 B.C.); but it may be doubted whether there are sufficient grounds for this conclusion.

The book deals with the problem of human life; in modern phraseology it is a work of religious philosophy. Job is a righteous man, overwhelmed with undeserved misfortune; and thus the question is raised, Why do the righteous suffer? Is their suffering consistent with the justice of God? The dominant theme at the time when Job was written was that all suffering was a punishment of sin; and the aim of the book is to controvert this theory. Job's friends argue that he must have been guilty of some grave sin; Job himself passionately maintains his innocence; and on the issue thus raised the dialogue of the book is built. It is indeed a question whether the whole series of speeches and the final resolution of the book were supplied by tradition; and a later hand probably developed this outline, and made it a vehicle for expressing his new thoughts respecting a great moral problem which perplexed his contemporaries. A variety of indications (see Job) combine to show that the book of Job was not written till after the time of Jeremiah—probably, indeed, not till after the return from exile. The speeches of Elihu (chs. xxxii.-xxxvii.) are not part of the original poem, but were inserted in it afterwards.

There follow (in the Hebrew Bible) the five short books, which, as explained above, are well known by the Jews as the Megilloth, or "Rolls," viz. Song of Songs, Ruth, Lamentations, Ecclesiastes, and Esther. Of these, the Song of Songs, in exquisite poetry, extols the power and sweetness of pure and faithful human love. The date at which it was written is uncertain; there are features in it which point to its having been the work of a poet living in north Israel, and writing at an early date; but most recent scholars, on account chiefly of certain late expressions occurring in it, think that it cannot have been written earlier than the 4th or 3rd century B.C. In the graceful and tender idyll of Ruth, it is told how Ruth, the Moabitess, and a native consequently of no accurate history, i.e. of 680-15 B.C., was adopted into Israel's faith (i. 16), and was counted worthy to become an ancestress of David. The date of Ruth is disputed: Driver has defended a pre-exilic date for it, but generally the opinion of modern scholars is that it belongs to the 5th century B.C. The Lamentations consist of five elegies on the fall of Jerusalem, and the sufferings which its people experienced in consequence; they must all have been composed not long after 586 B.C. Ecclesiastes, the third book belonging (see above) to the Wisdom-literature, consists of moralizing, prompted by the dark times in which the hore's lot in life was so hard, and the theory seemed to him to be the reward of all human endeavour, and the inability of man to remedy the injustices and anomalies of society. If only upon linguistic grounds—for the Hebrew of the book resembles often that of the Mishnah more than the ordinary Hebrew of the Old Testament—Ecclesiastes must be one of the latest books in the Hebrew canon. It was most probably written during the Greek period towards the end of the 3rd century B.C. The book of Esther, which describes, with many legendary traits, how the beautiful Jewess succeeded in rescuing her people from destruction, dates probably after 168-165 B.C., and is thought by many scholars to be even later.

The Book of Daniel.—The aim of this book is to strengthen and encourage the pious Jews in their sufferings under the persecution of Antiochus Epiphanes, 168-165 B.C. Chs. i.-vi. consist of narratives, constructed upon a traditional basis, of the experiences of Daniel at the Babylonian court, between 605 and 538 B.C., with the design of illustrating how God, in times of trouble, defends and succours His faithful servants. Chs. vii.-xii. contain a series of visions, purporting to have been seen by Daniel, and describing, sometimes (especially in ch. xi.) with considerable minuteness, the course of events from Alexander the Great, through the two royal lines of the Ptolemies and the Seleucidae, to Antiochus Epiphanes, dwelling in particular on the persecuting measures adopted by Antiochus against the Jews, and promising the tyrant's speedy fall (see e.g. viii. 9-14, 23-25, xi. 21-43). Internal evidence shows clearly that the book cannot have been written by Daniel himself; and that it must in fact be a product of the period in which its interest culminates, and the circumstances of which of which it gives a picture of the times. Chronicles, Ezra and Nehemiah.—These books form the second series of historical books referred to above, Ezra and Nehemiah carrying on the narrative of Chronicles, and forming its direct sequel. 1. Chr. i.-ix. consists mostly of tribal genealogies, partly based upon data contained in the older books (Gen.—Kings), partly including materials found by the compiler elsewhere. 1. Chr. x.-xx. consists of a series of excerpts from the books of Samuel and Kings—sometimes transcribed without substantial change, at other times materially altered in the process—containing, as a matter, in some cases limited to two or three others extended, and sometimes, as the book of Esther, divided and distributed by the compiler himself, and differing markedly from the excerpts from the older books both in phraseology and in point of view. The books of Ezra and Nehemiah are of similar structure; here the sources excerpted are the Memoirs of Ezra and Nehemiah, written by themselves in the first person; viz. Ezra vii. 12-ix. (including the decree of Artaxerxes, vii. 12-20); Neh. i. 1-7. vii. 36, xii. 37-41, xiii.; and a narrative written in Aramaic (Ezra iv. 8—vi. 18); Ezra x. and Neh. viii.-x. also are in all probability based pretty directly upon the Memoirs of Ezra; the remaining parts of the books are the composition of the compiler. The additions of the compiler, especially in the Chronicles, place the old history in a new light; he invests it with the associations of his own day; and pictures pre-exilic Judah as already possessing the fully developed ceremonial
system, under which he lived himself, and as ruled by the ideas and principles current among his contemporaries. There is much in his representation of the past which cannot be historical. For examples of narratives which are his composition see 1 Chr. 1-24, xvi. 4-42, xxi. 2-xxii.; 2 Chr. xiii. 3-22, xiv. 6-xv. 15, xvi. 7-11, xvii., xix. 1-xx. 30, xxi. 16-20, xxix. 3-xxxi. 21. On account of the interest shown by the compiler in the ecclesiastical aspects of the history, his work has been not inaptly called the "Ecclesiastical Chronicle of Jerusalem." From historical allusions in the book of Nehemiah, it may be inferred that the compiler wrote at about 300 B.C. (S. R. D.)

2. Tests and Versions.

Text.—The form in which the Hebrew text of the Old Testament is presented to us in all MSS. and printed editions is that of the Massoretic text, the date of which is usually placed somewhere between the 6th and 9th centuries of the Christian era. It is probable that the present text became fixed as early as the 2nd century A.D., but even this earlier date leaves a long interval between the original autographs of the Old Testament writers and our present text. Since the fixing of the Massoretic text the task of preserving and transmitting the sacred books has been carried out with the greatest care and fidelity, with the result that the text has undergone practically no change of any real importance; but before that date, owing to various causes, it is beyond dispute that a large number of corruptions were introduced into the Hebrew text. In dealing, therefore, with the textual criticism of the Old Testament and the period at which the text assumed its present fixed form before considering the means at our disposal for controlling the text when it was, so to speak, in a less settled condition.

An examination of the extant MSS. of the Hebrew Old Testament reveals two facts which at first sight are somewhat remarkable. The first is that the oldest dated MS., the Codex Masoretic text. Babylonicus Petropolitanus, only goes back to the year A.D. 916, though it is probable that one or two MSS. belong to the 9th century. The second fact is that all our Hebrew MSS. represent on the one hand the text known as the Massoretic. This text was the work of a special guild of trained scholars called Massoretes (πασσαρής) or masters of tradition (τάξις or less correctly τάξιον), whose aim was not only to preserve and transmit the consonantal text which had been handed down to them, but also to ensure its proper pronunciation. To this end they provided the text with a complete system of vowel points and accents. Their labours further included the compilation of a number of notes, to which the term Massorah is now usually applied. These notes for the most part constitute a sort of index of the peculiarities of the text, and possess but little general interest. More important are those passages in which the Massoretes have definitely adopted a variation from the consonantal text. In these cases the vowel points attached to the written word (Ketib) belong to the word which is to be substituted for it, the latter being placed in the margin with the initial letter of Qere (= to be read) prefixed to it. Many even of these readings merely relate to variations of spelling, pronunciation or grammatical forms; others substitute a more correct expression for the coarser phrase of the text, but in some instances the suggested reading really affects the sense of the passage. These last are to be regarded either as old textual variants, or, more probably, as emendations corresponding to the errata or corrigenda of a modern printed book. They do not point to any critical editing of the text; for the aim of the Massoretes was essentially conservative. Their object was not to create a new text, but rather to ensure the accurate transmission of the traditional text which they themselves had received. Their work may be said to culminate in the vocalized text which resulted from the labours of Rabbi Aaron ben Asher in the 10th century.2 But the writings of Jerome in the 4th, and of Origen in the 3rd century both testify to a Hebrew text practically identical with that of the Massoretes. Similar evidence is furnished by the Mishna and the Gemara, the Talmud, and finally by the Greek version of Aquila,4 which dates from the first half of the 2nd century A.D. Hence it is hardly doubtful that the form in which we now possess the Hebrew text was already fixed by the beginning of the 2nd century. On the other hand, evidence such as that of the Book of Jubilees shows that the form of the text still fluctuated considerably as late as the 1st century A.D., so that we are forced to place the fixing of the text some time between the fall of Jerusalem and the production of Aquila's version. Nor is the occasion far to seek. After the destruction of Jerusalem in 70 A.D. the system of biblical exegesis founded by Rabbi Hillel reached its climax at Jamnia under the famous Rabbi Aqiba (d. c. 132). The latter's system of interpretation was based upon an extremely literal treatment of the text, according to which the smallest words or particles, and sometimes even the letters of scripture, were invested with divine authority. The inevitable result of such a system must have been the fixing of an officially recognized text, which could scarcely have differed materially from that which was finally adopted by the Massoretes. That the standard edition was not the result of the critical investigation of existing materials may be assumed with some certainty.6 Indeed, it is probable, as has been suggested,7 that the manuscript which was adopted as the standard text was an old and well-written copy, possibly one of those which were preserved in the Court of the Temple.

But if the evidence available points to the time of Hadrian as the period at which the Hebrew text assumed its present form, it is even more certain that prior to that date the various MSS. of the Old Testament differed very materially from one another.

Sufficient proof of this statement is furnished by the Samaritan Pentateuch and the versions, more especially the Septuagint.

Indications also are not wanting in the Hebrew text itself to show that in earlier times the text was treated with considerable freedom. Thus, according to Jewish tradition, there are eighteen passages in which the older scribes deliberately altered the text on the ground that the language employed was either irreverent or liable to misconception. Of a similar nature are the changes introduced into proper names, e.g. the substitution of boseth (= shame) for ba'din in Ioshbesheth (2 Sam. ii. 8) and Mephibosheth (2 Sam. ii. 18; cf. the older forms Esbahaal and Meribaal, 1 Chron. 34, 35); the use of the verb "to bless" (יָשֵׁר) in the sense of cursing (1 Kings xxi. 10, 13; Job i. 5, 11, ii. 5, 9; Ps. x. 3); and the insertion of "the enemies of" in 1 Sam. xxv. 22, 2 Sam. xii. 14. These intentional alterations, however, only affect a very limited portion of the text, and, though it is possible that other changes were introduced at different times, it is very 8

1 For a discussion of this word see W. Bacher (J.Q.R. vol. iii. pp. 765 f.), who maintains that the original pronunciation of these words was y=x and =.x.
2 The actual date of the introduction of vowel points is not known, but it must in any case have been later than the time of Jerome, and is probably to be assigned to the 7th century. Of the system of pronunciation which are known to us, the more familiar is the Tiberian, or sublinear, which is found in all printed editions of the Hebrew Bible. The other system, the Babylonian or superlinear, is chiefly found in certain Yemen MSS. For yet a third system of vocalization see Z. A. T. W. see M. Friedlander, JQR. 1895, pp. 564 f., and P. Kahle in Z. A. T. W. xxii. (1901), pp. 273 f. Probably the idea of providing vowel points was borrowed from the Syrians.

unlikely that they were either more extensive in range or more important in character. At the same time it is clear both from internal and external evidence that the archetype from which our MSS. are descended was far from being a perfect representative of the original text. For a comparison of the different parallel passages which occur in the Old Testament (e.g., 1 and 2 Samuel, 1 and 2 Kings, and 1 and 2 Chronicles; 2 Kings xviii. 13-xx. 19 and Isaiah xxxvi.-xxxix; 2 Sam. xxi. and Ps. xviii.; Ps. xiv. and iiii., &c.) reveals many variations which are obviously due to textual corruption, while there are many passages which in their present form are either ungrammatical, or inconsistent with the context or with other parallel passages, especially the Septuagint, frequently exhibit variations from the Hebrew which are not only intrinsically more probable, but often explain the difficulties presented by the Massoretic text. Our estimate of the value of these variant readings, moreover, is considerably heightened when we consider that the MSS. on which the versions are based are older by several centuries than those from which the Massoretic text was derived, hence the text which they presuppose has no slight claim to be regarded as an important witness for the original Hebrew.

But the use of the ancient witnesses should not make us suppose that the Massoretic text possesses an unexampled character as might be inferred. . . . In the use of the ancient versions for the purposes of textual criticism there are three precautions which must always be observed; we must reasonably assure ourselves that we possess the version itself in its original integrity; we must eliminate such variants as have the appearance of originating merely with the translator; the remainder, which will be those that are due to a difference of text in the MS. (or MSS.) used by the translator, we must then compare carefully, in the light of the considerations just stated, with the existing Hebrew text, in order to determine on which side the superiority lies.

Versions.—In point of age the Samaritan Pentateuch furnishes the earlier version in the Hebrew text. It is not a version, but merely that text of the Pentateuch which has been preserved by the Samaritan community since the time of Nehemiah (Neh. xiii. 23-31), i.e. about 432 B.C.

It is written in the Samaritan script, which is closely allied to the old Hebrew as opposed to the later "square" character. We further possess a Samaritan Targum of the Pentateuch written in the Samaritan dialect, a variety of western Aramaic, and also an Arabic translation of the five books of the law; the latter dating perhaps from the 11th century A.D. or earlier. The Samaritan Pentateuch agrees with the Septuagint version in many passages, but its chief importance consists in the fact that it has to the substantial agreement of our present text of the Pentateuch, apart from certain intentional changes, with that which was promulgated by Ezra. Its value as a text in the Massoretic system is a matter of dispute, and is mainly connected with the manuscripts of the MSS., upon which the printed text is based.

The Targums, or Aramaic paraphrases of the books of the Old Testament (see Targum), date from the time when Hebrew had been replaced by Aramaic by the Jews, i.e. during the period immediately preceding the Christian era. In their written form, however, the earlier Targums, viz., those on the Pentateuch and the prophetic books, cannot be earlier than the 4th or 5th century A.D. Since they were designed to meet the needs of the people and had a directly didactic aim, they are naturally characterized by expansion and paraphrase, and thus afford invaluable illustrations of the methods of Jewish interpretation and of the development of Jewish thought. The text which they exhibit is virtually identical with the Massoretic text. The earliest among the versions as well as the most important for the textual criticism of the Old Testament is the Septuagint.

This version probably arose out of the needs of the Greek-speaking Jews of Alexandria in the 3rd century B.C. While the translation is not later than the reign of Ptolemy Philadelphus (284-247 B.C.), and, though the form (viz. the Letter of Aristides) in which this tradition has come down to us cannot be regarded as historical, it yet seems to have preserved correctly both the date and the locality of the version. The name Septuagint, strictly speaking, only applies to the collection of the 70 Greek versions which were translated in Alexandria under the Greek "law" or imperative of the Septuagint, and to the other books of the Old Testament as they were translated. That the interval which elapsed before the Prophets and the Hagiographa were also translated was no great thing, since when the Sirech were prepared, the "law" of the Septuagint, and the rest of the books,* as already current in a translation by 132 B.C. The date at which the various books were combined into a single edition is also unknown, but Eusebius (Hist. Eccl. viii, 23) may be assumed for the 1st century A.D., at which period the Greek version was universally accepted by the Jews of the Dispersion as Scripture, and from them passed on to the Christian Church.

Versions of the Greek Bible.—The Greek text of the Old Testament, and especially the Septuagint, was translated into the Greek of the Septuagint, and the rest of the books,* as already current in a translation by 132 B.C. The date at which the various books were combined into a single edition is also unknown, but Eusebius (Hist. Eccl. viii, 23) may be assumed for the 1st century A.D., at which period the Greek version was universally accepted by the Jews of the Dispersion as Scripture, and from them passed on to the Christian Church.

The Greek translation of the New Testament, which was a work of the 1st century A.D. or the beginning of the 2nd century, was not made to replace the earlier existing Hebrew MSS., but was simply a translation of the Greek of theSeptuagint into the Attic form of Greek. In the case of the New Testament only the books of the New Testament were ever translated into the Greek of the Septuagint. The Greek version was also preferred in Egypt and in the Syrian churches. Prof. Schurer says that "it may be assumed for the 1st century A.D., at which period the Greek version was universally accepted by the Jews of the Dispersion as Scripture, and from them passed on to the Christian Church.

Versions of Aquila, Symmachus, and Theodotion. Aquila was a Jewish proselyte of Pontus, and since he was a disciple of Rabbi Aquiba (6. A.D., 135), and according to another Talmudic account) also of Rabbi Eleazar and Rabbi Joshua, the immediate predecessors of Aquiba, his version may be assigned to the first half of the 2nd century. It is characterized by extreme literalism, and the redaction of which was then in vogue among the Jewish rabbis. Its slavish adherence to the original caused the new translation to be received with favour by the Hellenistic Jews, among whom it quickly came into general use. For Fig. 17 the older version which owing to its character is of the greatest value to the textual critic, we have until recently been indebted to Origen's Hexapla (see below); for, though Jerome mentions a secunda editio, no MS. of this translation has survived. Fragments, however, of the manuscripts were discovered (1897) in the genizah at Cairo, which illustrate more fully the peculiar features of this version.

The accounts given of Symmachus and Theodotion are somewhat conflicting. Both Symmachus and Theodotion are described as Jews, and while the former calls him an Ephesian and mentions his translation before that of Aquila, the latter states that he was a native of Cyprus. Symmachus, according to a following generation, translated to the reign of Commodus (A.D. 180-192); others, according to Jerome, describe him as an Ebionite. On the whole it is probable that Symmachus has preserved the most trustworthy account.
end of the 2nd century. His version was commended by Jerome as giving the sense of the original, and in that respect it forms a direct contrast with that of Aquila. Indeed Dr Swete1 thinks it probable that "he wrote with Aquila's version before him, (and that) in his efforts to rival it he made free use both of the Septuagint and of Theodotion."

As in the case of Aquila, our knowledge of the works of Theodotion and Syriac of his time is far from systematic. Fragments have been preserved through the labours of Origen. This writer's Hexapla, (see ORIGEN) conceived the idea of collecting all the corresponding readings of the Old Testament with a view to recovering the original text of the Hebrew; and he arranged them and partly by means of the current Hebrew text. He accordingly arranged the texts to be compared in six parallel columns in the following order:—(1) the Hebrew text; (2) the Hebrew translated into Syriac (the Syriac version of the Old Testament); (3) the parallel readings of the Syriac; (4) the parallel readings of the Greek Septuagint; (5) the readings of the Greek version of the Old Testament which was used by the 5th century; and (6) Theodotion. In the Septuagint column he drew attention to those passages for which there was no Hebrew equivalent by prefixing an obelus; but where the Septuagint text corresponded to the Hebrew text he supplied the omissions, chiefly but not entirely from the translation of Theodotion, placing a asterisk at the beginning of the interpolation; the close of the passage to which the obelus or the asterisk was prefixed is denoted by the metabelus. That Origen did not succeed in his object of recovering the original Septuagint was due to the fact that he started with the false conception. The original text of the Septuagint must, it is true, be regarded as the nearest approach to the actual text of the Hebrew; but the Syriac text is the result of the labours of many of the most characteristic features of the old version, but also exercised a prejudicial influence on the MSS. of that version. The Hexapla as a whole was far too large to be copied, and the result was published (with many errors) by Eusebius of Caesarea, Filipus, and was extensively used in Palestine during the 4th century. During the same period two other Greek recensions made their appearance, that of Hexychius which was current in Egypt, and that of Lucian which was the accepted text of the Antiochene Church. Of Hexychius little is known. His text is supposed to be found in the Egyptian MSS. of the Codex Mazarinianus, and in the quotations of Cyril of Alexandria. Lucian was a priest of Antioch who was martyred Nicomedica in A.D. 311 or 312. His revision (to quote Dr Swete) was doubtless an attempt to revive the heaven of "the true text" or "Septuagint text" in the sense of the Alexandrian. The Lucianic account had with the principles of criticism which were accepted at Antioch. To Cerennus is due the discovery that the text preserved by codices 19, 82, 93, 106, really represents Lucian's recension; the same conclusion was reached independently by Lagarde, who simplified codex 118 with the four mentioned above. As Field (Hexapla, p. 87) has shown, this discovery is confirmed by the marginal readings of the Syro-Hexapla. A similar connection with the Septuagint, as from Dr Swete, as on the Hexapla, p. 52, is characterized by the substitution of synonyms for the words originally used by the Septuagint, and by the frequent occurrence of double renderings, but its chief claim to our credit is the fact that it emended renderings not found in other MSS. of the Septuagint which presuppose a Hebrew original self-evidently superior in the passages concerned to the existing Masoretic text.2

This version has been greater importance in this respect is the Old Latin version, which undoubtedly represents a Greek original prior to the Hexapla. "The earliest form of the version" (to quote Dr Kennedy)4 to which we can assign a definite date, namely, that used by Cyprian, plainly circulated in Africa." In the view of many authorities this version was first produced at Carthage, but recent writers are inclined to regard Antioch as its birthplace. a view which is supported by the remarkable agreement of its readings with the Lucianic recension and with the early Syriac MSS. Unfortunately the only version is extant in a fragmentary form, being preserved partly in MSS., partly in quotations of the Pataclogie and in parts of the Vulgate. However, which do not appear to have been revised by Jerome, still represent the older version. It was not until after the 6th century that the Old Latin was finally superseded by the Vulgate, or Latin translation of the Old Testament made by Jerome during the last quarter of the 4th century. This new translation was translated from the Hebrew, but Jerome also made use of the Greek versions, especially of Symmachus. His original intention was to revise the Old Latin, and his two revisions of the Psalter, the Roman and the Gallican, the latter modelled on the Hexapla, still survive. Of the other books which are prefaced with the name of Job has alone come down to us. For textual purposes the Vulgate possesses but little value, since it presupposes a Hebrew version practically identical with the text stereotyped by the Massoretes.

Syriac Versions.—The Peshitta or simple version of the Old Testament is a translation from the Hebrew, though certain books have been fused by the Septuagint. The date is unknown, but it is usually assigned to the 2nd century A.D. Its value for textual purposes is not great, partly because the underlying text is the same as the Massoretic, partly because the Syriac version has differed times been harmonized with that of the Septuagint.

The Syro-Hexaplar version, on the other hand, is extremely valuable for critical purposes. This Syriac translation of the Septuagint column of the Hexapla was made by Paul, bishop of Tella, at Alexandria in A.D. 616-617. Its value consists in the extreme literality of the translation, which renders it possible to recover the Greek original with considerable certainty. It has further preserved the critical signs employed by Origen as well as many readings from the other Greek versions; hence it forms our chief authority for reconstruction of the original text. For the most part of this work is still extant; the poetical and prophetic books have been preserved in the Codex Ambrosianus at Milan (published in photolithography by Ceriani, Mon. Sacr. et Prof.), and the remaining books have been collected by Lagarde in his Bibliotheca Sacrae, etc.

Of the remaining versions of the Old Testament the most important are the Egyptian, Ethiopic, Arabic, Gothic and Armenian, still extant except for the Coptic, appear to have been made through the medium of the Septuagint.

3. Textual Criticism.

The aim of scientific Old Testament criticism is to obtain, through discrimination between truth and error, a full appreciation of the literature which constitutes the Old Testament, of the life out of which it grew, and the conditions of the influence which these have exerted and still exert. For such an appreciation many things are needed; and the branches of Old Testament criticism are correspondingly numerous. It is necessary in the first instance to detect the errors which have crept into the text in the course of its transmission, and to recover, so far as possible, the text in its original form; this is the task of Textual, or as it is sometimes called in contradiction to another branch, Lower Criticism. It then becomes the task of critical excess to interpret the text thus recovered so as to bring out the meaning of what the original text parakes of two characters, literary and historical. One branch seeks to determine the scope, purpose and character of the various books of the Old Testament, the times in and conditions under which they were written, whether they are severally the work of a single author or of several, whether they embody earlier sources and, if so, the character of these, and the conditions under which they have reached us, whether altered and, if altered, how; this is Literary Criticism. A further task is to estimate the value of this literature as evidence for the history of Israel, to determine, as far as possible, whether such parts of the literature as are contemporary with the time described present correct, or whether

1 Introduction to the Old Testament in Greek, p. 51.
2 Hence the name Hexapla. In some books, especially the poetical, the columns were increased to eight by the addition of the Quinta and Sexta, but the Octapla, as the enlarged work was called, was not apparently the distinct form. The remaining three were in a separate edition which did not contain the first two columns of the Hexapla.
3 Lagarde’s projected edition of the Lucianic recension was unfortunately not completed; the two fragments which contain 2 Ezech. Esther. It may be noted here that the Compleanen Polypodt represents a Lucianic text.
4 Hastings’s Dict. of the Bible, iii. pp. 54 ff.
in any respect one-sided or biased or otherwise incorrect, descriptions; and again, how far the literature that relates the story of long past periods has drawn upon trustworthy records, and how far it is possible to extract historical truth from traditions (such as those of the Pentateuch) that present, owing to the gradual accretions and modifications of intervening generations, a composite picture of the period described, or from a work such as Chronicles, which narrates the past under the influence of the conception that the institutions and ideas of the present must have been established and current in the past; all this falls under Historical Criticism, which, on its constructive side, must avail itself of all available and well-authenticated facts, whether derived from the Old Testament, or elsewhere, for its presentation of the history of Israel—its ultimate purpose. Finally, by comparing the results of this criticism as a whole, we have to determine, by observing its growth and comparing it with others, the essential character of the religion of Israel.

In brief, then, the criticism of the Old Testament seeks to discover what the words written actually meant to the writers, what the events in Hebrew history actually were, what the religion actually was; and hence its aim differs from the dogmatic or homiletic treatments of the Old Testament, which have sought from various sources, whatever the underlying body of dogma or incentives to a particular type of life or the like.

Biblical criticism, and in some respects more especially Old Testament criticism, is, in all its branches, very largely of modern growth. This has been due in part to the removal of conditions unfavourable to the critical study of the evidence that existed, in part to the discovery in recent times of fresh evidence. The unfavourable conditions and the critical efforts which were made in spite of them can only be briefly indicated.

For a long time Biblical study lacked the first essential of sound critical method, viz., a critical text of the sacred literature. Jewish study was exclusively based on the official Hebrew text, which was fixed, probably in the 2nd century A.D., and thereafter scrupulously preserved. This text, however, had suffered certain now obvious corruptions, and, probably enough, more corruption than can now, or perhaps ever will, be detected with certainty. The position of Christian (and Jewish Alexandrian) scholars was considerably worse; for, with rare exceptions, down to the 5th century, and practically without exception between the 5th and 15th centuries, their study was exclusively based on the primitive Hebrew text; and when, for instance, the Septuagint, there certainly underlay an earlier form of the Hebrew text than that perpetuated by Jewish tradition, and if Christian scholars could have worked through the version to the underlying Hebrew text, they would often have come nearer to the original meaning than their Jewish contemporaries. But this they could not do; and since the version, owing to the limitations of the translators, departs widely from the sense of the original, Christian scholars were on the whole kept much farther from the original meaning than their Jewish contemporaries, who used the Hebrew text; and later, after Jewish grammatical and philological study had been stimulated by intercourse with the Arabs, the relative advantages under which Christian scholarship laboured increased. Still there are not lacking in the early centuries A.D. important, if limited and imperfect, efforts in textual criticism. Origen, in his Hexapla, placed side by side the Hebrew text, the Septuagint, and certain later Greek versions, and drew attention to the variations; he thus brought together for comparison, an indispensable preliminary to criticism, the chief existing evidence to the text of the Old Testament. Unfortunately this great work proved too voluminous to be preserved entire; and in the form in which it was fragmentarily preserved, it even largely enhanced the critical task of later centuries. Jerome, perceiving the unsatisfactory position of Latin-speaking Christian scholars who studied the Old Testament at a double remove from the original—in Latin versions of the Greek—made a fresh Latin translation direct from the Hebrew text then received among the Jews. It is only in accordance with what constantly recurs in the history of Biblical criticism that this effort to approximate to the truth met at first with considerable opposition, and was for a time regarded even by Augustine as dangerous. Subsequently, however, this version of Jerome (the Vulgate) became the basis of Western Biblical scholarship. Henceforward the Western Church suffered both from the corruptions in the official Hebrew text and also from the fact that it occurred from a version and not from the original, for a knowledge of Hebrew was rare indeed among Christian scholars between the time of Jerome and the 16th century.

If the use of versions, or of an uncritical text of the original, was one condition unfavourable to criticism, another that was not less serious was the dominance over both Jews and Christians of the allegorical notions of the Alexandrian School—legal or dogmatic or allegorical. The influence of these can be seen as early as the Greek version (3rd century B.C. and later); allegorical interpretation is conspicuous in the Alexandrian Jewish scholar Philo (q.v.); it may be seen in many New Testament interpretations of the Old Testament (e.g. Gal. iii. 16, iv. 21-31), found a classical exponent in Origen, and, in spite of the opposition of the school of Antioch, pre-eminently of Theodore (d. A.D. 428), maintained its power virtually unbroken down to the Reformation. It is true that even by the most thorough-going allegorists the literal sense of Scripture was not openly and persistently disregarded. But it was the invariable fact that the literal sense was never more than exceptional, and so early ceased to be cultivated at all, is eloquent of indifference to the original literal sense, and the very principle of the many meanings inherent in the sacred writings was hostile to sound interpretation; greater importance was attached to the "deeper" or "hidden" senses, i.e. to the various unreal interpretations, and when the literal sense conflicted with the dogmas or tradition of the Church its validity was wholly denied. The extraordinary ambiguity and uncertainty which allegorical interpretation tacitly ascribed to Scripture, and the ease with which heretical as well as orthodox teaching could be represented as "hidden" under the literal sense, was early perceived, but instead of this leading to any real check on even wild subjectivity in interpretation and insistence on reaching the literal sense, it created an ominous principle that maintained much of its influence long after the supremacy of allegorism was overthrown. This is the principle that all interpretation of Scripture must be according to the Regula fidelis—that all interpretation which makes Scripture contradict or overread the traditions of the Church is wrong.

The spirit and the age of humanism and the Reformation effectively witnessed to these grand results in the study of the Old Testament. It was still long before any considerable results were achieved; but in various ways the dogmatic and traditional treatment of Scripture was undermined; the way was opened for a more real and historical method. It must suffice to refer briefly to two points.

1. Ignorance gave place to knowledge of the languages in which the Old Testament was written. In 1500 the distinguished humanist, Johann Reuchlin, who had begun the study of Hebrew under a Jewish teacher about 1492, published a work entitled De Rusticatione Hebraicis containing a Hebrew lexicon and a Hebrew grammar. In 1504 Konrad Pelikan (Pellicanus), whose study of Hebrew had been interrupted by an intercourse with the French, undertook the introduction to the language. In 1543 the Complutensian Polyglott began to be printed and in 1552 was published. Various Jewish editions of the Hebrew Bible had already been printed—in part since 1477, centre since 1488; but this work contained the first Christian edition of the text. Certainly the editors did not intend hereby to exalt the original above the versions; for they placed the Vulgate in the centre of the page with the Hebrew on one side and the Greek on the other, i.e. as they themselves explained it, the Roman Church between the synagogue and the Greek Church, as Christ crucified between two thieves. Yet even so the publication of the Complutensian Polyglott was an important stage; henceforth the study of the original enters increasingly into Christian Biblical scholarship; it already underlay the translations which form so striking a feature of the 16th century. Luther's German translation of the Pentateuch, 1522, and of the New Testament, 1534, are both made from the Hebrew. At first, and indeed down to the middle of the 17th century, Jewish traditions and the study of Hebrew dominated Christian scholars; but in the 17th and 18th centuries the study of other Semitic languages opened up that comparative linguistic study which was systematized and brought nearer to perfection in the 19th century.

O.T. CRITICISM

The leading Reformers—Luther, Zwingli, Melanchthon, and others—had expressed themselves against the literal view of the manifold sense of Scripture, and in particular questioned the legitimacy of allegorical interpretation—except for purposes of popular and practical exposition. The Reformation effort to defend the literal sense is characteristic of Calvin’s extensive exegetical works. True, practice did not always keep pace with theory, and the literal sense had to yield if it came into conflict with the “Faith” of the Reformed. But, the allegorical method for long obscured the meaning of the Song of Songs, and any departure from it was severely condemned; just as Theodoret of Mopsuestia drew down on himself for maintaining the literal sense of the Song in his Commentaries on the Second Canon of Constantinople (A.D. 553), so Sebastian Castellio owed (in part) to the same indiscretion his expulsion from Geneva in 1544. Even in the 16th and 17th centuries scholars like Grotius and Michaelis met with violent opposition for the same cause.

But, however slowly and irregularly, the new conditions and the new spirit affected the study of the Old Testament. It became subject to the same critical methods which since the Renaissance have been applied to other ancient literatures. Biblical criticism is part of a wider critical movement, but it is noticeable how, from stage to stage, Biblical scholars adopted the various critical methods which as they proceeded they came to attribute value to. Biblical antiquarianism, the literalism of the Jews, the Hellenistic version of the Old Testament; Hellenistic and the study of the History of Israel (1843–1859).

The fundamental principles of the Textual Criticism of the Old Testament are the same as those which apply to any other ancient text and need not be described here (see the article TEXTUAL CRITICISM). There are also, however, certain conditions peculiar to the text of the Old Testament. The significance of these and the extent to which they must govern the application of the general principles have even yet scarcely obtained full and general recognition. These, then, must be briefly described.

The earliest Hebrew MSS. of the Old Testament date from not earlier than the 9th century A.D., or nearly one thousand years after the latest parts of the Old Testament were written. These MSS., and the Hebrew Bibles as usually printed, contain in reality two perfectly distinct texts—the work of two different ages separated from one another by centuries: the one is a text of the Old Testament itself, the other a text of a later Jewish interpretation of the Old Testament. The text of the Old Testament consists of consonants only, for the alphabet of the ancient Hebrews, like that of their Moabite, Aramaean and Phoenician neighbours, did not contain vowels; the text of the interpretation consists of vowels and accents only—for vowel signs and accents had been invented by Jewish scholars between the 4th and 5th centuries A.D.; the text of the Old Testament is complete in itself and intelligible, though ambiguous; but the text of the interpretation read by itself is unintelligible, and only becomes intelligible when read with the consonants (under, over, or in which they are inserted) of the text of the Old Testament. But the fact that the later text makes use of the earlier to make itself intelligible in no way destroys the fact that it is as entirely distinct a work from the earlier as it is from any other work. The first task of Old Testament textual criticism after the Reformation was to prove the independence of these two texts, to gain general recognition of the fact that vowels and accents formed no part of the original Hebrew text of the Old Testament. The conflict that arose over this question in the Christian Church was prolonged and bitter—in part because it unfortunately became inflamed by the contending interests of Roman Catholic and Protestant. The coeval origin of consonants and vowels had indeed been questioned or denied by the earliest reformers (Luther, Zwingli, Calvin), but later, in the early period of Protestant scholarship, there was formed the theory of one school of Jewish Rabbis, Protestant scholars in particular, and especially those of the Swiss school, notably the Buxtorfs, had committed themselves to the view that the vowels formed an integral and original part of the text of the Old Testament; and this they maintained with all the more fervency because the ambiguity of the consonants without the vowels was a troublesome fact in the way of the extreme Protestant doctrine of the inspiration, verbal infallibility and sufficiency of Scripture, while it was not necessary for the Catholic theologians to insist on the doctrine of the need for an authoritative interpretation. Still in the end it was due in large measure to the learning and argumentative power devoted to this subject by the French Protestant scholar, Louis Capell, and, amongst others, by the English Protestant scholar, Brian Walton, that by the end of the 17th century this particular controversy was practically at an end; criticism had triumphed, and the later origin of the vowels was admitted. Yet, as often happens, the influence of tradition lingered long after it had been proved to be false; thus the R.V., instead of being an independent translation of the Hebrew text, is intended (with rare exceptions, as e.g. in Ls. ix. 19, where R.V. translates the Hebrew text and R.V. margin the Jewish interpretation) to be merely a translation of the Jewish interpretation; and to the present day it is usual, though obviously uncertain and wrong, to describe perfectly legitimate translations of the received consonant text, if they happen to presuppose other vowels than those provided by Jewish tradition, as based on emendation; even in the English edition of Haupt’s Sacred Books of the Old Testament (see below) the possibility of this unfortunate misunderstanding is not altogether removed.

But the original text of the Old Testament long before it was combined with the text of the Jewish or Massoretic interpretation had already undergone a somewhat similar change, the extent of which was indeed far less, but also less clearly discoverable. This change consisted in the insertion into the original text of certain consonants which had come to be also used to express vowel sounds: e.g. the Hebrew consonant corresponding to τσ also expressed the vowel ου, the consonant χ the vowel ε, and so forth. For reasons suggested partly by the study of the transcriptions, partly by comparison of passages occurring twice within the Old Testament, and partly by a comparison of the Hebrew text with the Septuagint, it is clear that the authors of the Old Testament (or at least most of them) themselves made some use of these vowel consonants, but that in a great number of cases the vowel consonants that stand in our present text were inserted by transcribers and editors of the texts. Again, and for similar reasons, it is probable that in many cases, if not in all, the original texts were written without any clear division of the consonants into words. In view of all this, it is first from such important facts as the occurrence of variations in the two Hebrew texts of passages found twice in the Old Testament itself, and the variations brought to light by a comparison of the Jewish and Samaritan texts of the Pentateuch, the Hebrew

text and the Septuagint, the Hebrew text and New Testament quotations from the Old Testament.

In order that the principles already perceived by Capellus might be satisfactorily applied in establishing a critical text, many things were needed; for example, a complete collation of existing MSS. of the Jewish text and of the Samaritan text of the Pentateuch, the establishing of a critical text of the Septuagint, a careful study of the several versions directed to determining when real variants are implied and what they are. Some of this work has been accomplished; much of it remains to be done.

The Hebrew MSS. were collated by Kennicott and de Rossi at the close of the 18th century, with sufficient thoroughness to justify the important conclusion that all existing MSS. reproduce a single recension. The Samaritan MSS. are still very imperfectly collated; the same is true of the Syriac and other versions except the Septuagint. In regard to the Septuagint, though the work is by no means complete, much has been done. For collection of material the edition of Holmes and Parsons (Oxford, 1708–1827), with its magnificent critical apparatus, is pre- eminent; the preparation of a similar edition, on a rather smaller scale but embodying the results of fresh and more careful collation, was subsequently undertaken by Cambridge scholars. These editions furnish the material, but neither attempts the actual construction of a critical text of the version. Some important contributions towards a right critical method of using the material collected have been made—in particular by Lagarde, who has also opened up a valuable line of critical work. Lagarde's edition of the 2nd recension of the Lucianic recension, one of the three great recensions of the Greek text of the Old Testament which obtained currency at the close of the 3rd and beginning of the 4th centuries A.D.

More especially since the time of Capellus the value of the Septuagint for correcting the Hebrew text has been recognized; but it has often been used uncritically, and the correctness of the Hebrew text underlying it in comparison with the text of the Hebrew MSS., though still perhaps most generally underestimated, has certainly at times been exaggerated. It has only been possible here to indicate in the briefest way what is involved in the collection and critical sifting of the extant evidence for the text of the Old Testament, how much of the work has been done and how much remains; and with equal brevity it must suffice to indicate the position which faces the textual critic when all that can be done in this way has been done. In so far as it is possible to recover the Hebrew text from which the Greek version was made, it is possible to recover a form of the Hebrew text current about 280 B.C. in the case of the Pentateuch, some time before 100 B.C. in the case of most of the rest of the Old Testament. By comparison of the Hebrew MSS. it is not difficult to recover the recension which with few and unimportant variants they have perpetuated, and which may safely be regarded as differing but slightly from the text current and officially established before the end of the 2nd century A.D. By a comparison of these two lines of evidence we can approximate to a text current about 300 B.C. or later; but for any errors which had entered into the common source of these two forms of the text we possess no documentary means of detection whatsoever. The case then stands thus. Except by the obviously absurd assumption of the infallibility of copyists for the centuries before c. 300 B.C., we cannot escape the conclusion that errors lurk even where no variants now exist, and that such errors can be corrected, if at all, only by conjectural emendation. The dangers of conjectural emendation are well known and apparent; large numbers of such emendations have been ill-advised; but in the case of many passages the only alternative for the textual critic who is at once competent and honest is to offer such emendations or to indicate that such passages are corrupt and the means of restoring them lacking.

Conjectural emendations were offered by Capellus in the 17th, and by scholars such as C. F. Houbigant, Archbishop Secker, Bishop Lowth and J. D. Michaelis in the 18th century. Some of these have approved themselves to successive generations of scholars, who have also added largely to the store of such suggestions; conjectural emendation has been carried furthest by upholders of particular metrical theories (such as Bickell and Duhm) which do not accommodate themselves well to the existing text, and by T. K. Cheyne (in Critica Biblica, 1893), whose restorations resting on a dubious theory of Hebrew history have met with little approval, though his negative criticism of the text is often keen and suggestive.

A model of the application of the various resources of Old Testament textual criticism to the restoration of the text is C. H. Cornill's Das Buch des Propheten Eschgel (1886): outstanding examples of important systematic critical notes are J. Wellhausen's Der Text der Bücher Samuelis (1891) and S. K. Driver's Notes on the Hebrew Text of the Books of Samuel (1890). Haupt's Sacred Books of the Old Testament, edited by various scholars, was designed to present, when complete, a critical text of the entire Old Testament with critical notes. The results of textual criticism, including a considerable number of conjectural emendations, are succinctly presented in Kittel's Biblia Hebraica (1906); but the text here printed is the ordinary Massoretic (vocalized) text. The valuable editions of the Old Testament by Baer and Delitzsch, and by Ginsburg, contain critical texts of the Jewish interpretation of Scripture, and therefore necessarily uncritical texts of the Hebrew Old Testament itself; it lies entirely outside their scope to give or even to consider the text of the Old Testament as received and perpetuated by the Jewish interpreters. See also the authorities mentioned in the following section.

(G. B. G.)*

We now pass on to consider the growth of literary and historic criticism, which constitute the Higher Criticism as already explained. Down to the Reformation conditions were unfavourable to such criticism; the prevailing dogmatic use of Scripture gave no occasion for inquiry into the human origins or into the real purport and character of the several books. Nevertheless we find some sporadic and tentative critical efforts or questions. The most remarkable of these was made outside the Church—a significant indication of the adverse effect of the conditions within; the Neo-platonist philosopher Porphyry 1 in the 3rd century A.D., untrammelled by church tradition and methods, anticipated one of the clearest and most important conclusions of modern criticism: he detected the incorrectness of the traditional ascription of Daniel to the Jewish captivity in Babylon and discerned that the real period of its composition was that of Antiochus Epiphanes, four centuries later. In the mind even of Augustine (Locuto in Jor. vi. 25) questions were raised by the occurrence of the formula "until this day" in Jos. iv. 9, but were stilled by a rather clever though wrong use of Jos. vi. 25; Abelard (Heloissae Problema, xii.) considers the problem whether the narrative of Moses's death in Deut. contains a prophecy by Moses or is the work of another and later writer, while the Jewish scholar Ibn Ezra (Abenazer), in a cryptic note on Deut. i. 1, which has been often quoted of late years, gathers together several indications that point, as he appears to perceive, to the post-Mosaic origin of the Pentateuch. Even rarer than these rare perceptions of the evidence of the quasi-historical books to their origin are such half-perceptions of the literary origin of the prophetic books as is betrayed by Ibn Ezra, who appears to question the Isaianic authorship of Is. xl-xlvii., and by Photius, patriarch of Constantinople in the 9th century, who, according to Dostel (Gesch. des A. T., 169), raises the question why the sixth chapter of Isaiah, containing the inaugural vision, does not stand at the beginning of the book.

Even after the Renaissance and the Reformation tradition continued influential. For though the Reformers were critical of the authority of ecclesiastical tradition in the matter of 1 His arguments are stated briefly (and in order to be refuted) by Jerome in his commentary on Daniel.
the interpretation and use of Scripture, they were not immediately interested in literary and historical criticism, nor concerned to challenge the whole body of traditional lore on these matters. At the same time we can see from among the Reformers how much their doctrine of the Reformers (unlike that of the Protestant scholastics who came later) admitted considerable freedom, in particular with reference to the extent of the canon, but also to several questions of higher criticism. Thus it is to Luther a matter of indifference whether or not Moses wrote the Pentateuch; the books of Chronicles he definitely pronounces less credible than those of Kings, and he considers that the books of Isaiah, Jeremiah and Hosea probably owe their present form to later hands. Carlstadt again definitely denied the Mosaic authorship of the Pentateuch on the ground that Moses could not have written the account of his own death and yet that Deut. xxxiv. cannot be separated from the rest of the Pentateuch. The later scholastic Protestant doctrine of verbal infallibility necessarily encouraged critical reaction and proved a widely extended retarding force far down into the 15th century. Nevertheless criticism advanced by slow degrees among individuals, now in the Roman Church, now in the number of those who sat loosely to the restrictions of either Roman or Protestant authority, and now among Protestant scholars and theologians. It worked its way to fruition, but even briefly to all these, and it may be more useful to select for somewhat full description, as showing what could be achieved by, and what limitations beset, even a critical spirit in the 17th century, the survey of the origin of the Old Testament given by one such individual—Thomas Hobbes in his Leviathan (published 1651) c. xxxiii. As far as possible this survey shall be cited verbatim:

"Who were the original writers of the several books of Holy Scripture has not been made evident by any sufficient testimony of other history, which is the only proof of matter of fact; nor can be, by any argument of natural reason: for reason serves only to confirm the conclusions of fact. But the following considerations therefore that must guide us in this question, must be that which is held out unto us from the books themselves: and this light, though it shew us not the author of every book, yet it is useless to give us knowledge of the time wherein they were written."

"And first, for the Pentateuch. . . . We read (Deut. xxxiv. 6) concerning the sepulchre of Moses 'that no man knoweth of his sepulchre to this day': that is, to the day wherein those words were written. It is therefore manifest that these words were written after his interment. For it were a strange interpretation to say Moses spake of his own sepulchre, though by prophecy, that it was not known wherein he was buried at the time of the writing that the last chapter only, not the whole Pentateuch, was written later, is met by Hobbes by reference to Gen. xii, 6 ('the Canaanite was then in the land') and Num. xxxi. 14 (citation from a book related to the history of the Israelites) which the Renatus Moabiticus draws at, and the conclusion reached that 'the five books of Moses were written after his time, though how long after is not so manifest.'"

"But though Moses did not compile those books entirely, and in the form we have them, yet he wrote all that he is said to have written: as, for example, the volume of the Law 'contained 'as it seemeth' in Deut. xi-xxvii, and this is that Law which 'having been lost, was long time after found again by Hilkiah and sent to King Josias (2 Kings xxii. 8)."

The books of Joshua, Judges, Ruth, Samuel are proved much later than the times recorded in them by the numerous passages which prove them to be in ancient conditions, 'Histories' or 'Memorial-volumes,' and Judges in particular by xviii. 30, 'where it said that 'Jonathan and his sons were priests to the tribe of Dan, until the day of the captivity of the land.'"

"Kings and Chronicles, besides the places which mention such monuments as, the writer saith, remained till his own days' (Hobbes here cites thirteen from Kings, two from Chron.), 'it is argument sufficient that they were written after the captivity, for the facts registered are always more ancient than the register; and much more ancient than such books as make mention of and quote the register, as those books do in divers places.'"

"Ezra and Nehemiah were written after, Esther during, or after, the captivity; Job, which is not a history but a philosophical poem, at an uncertain date. The Psalms were written mostly by David, Solomon, that the history of them is continued till that time. For the facts registered are always more ancient than the register; and much more ancient than such books as make mention of and quote the register, as those books do in divers places."

"In what follows the actual quotations are from his English work; some of the summaries take account of the brief expansions in his later Latin version.

"And 126th, whereby it is manifest that the psalter was compiled and put into the form it now hath, after the return of the Jews from Babylon. The compilation of Psalms is no later than any of those whose proverbs are therein contained; but Ecclesiastes and Canticles are wholly Solomon's except the titles. There is little noticeable in Hobbes' dating of the prophets, though he considers that, 'it's not apparent' whether Amos wrote, as well as composed, his prophecy, or whether Jeremiah and the other prophets of the time of Josiah and Ezekiel, Daniel, Haggai and Zechariah, who lived in the captivity, went to the prophet's house before the restoration after the captivity was begun, considering the inscriptions, or titles of their books, it is manifest enough that the whole Scripture of the Old Testament was set forth in form we have it after the return of the Jews from their captivity in Babylon and before the time of Ptolemaeus Philadelphus."
behind the compiler to the earlier sources and thus push back the evidence of much of the Pentateuch beyond the date of its compilation to the earlier date of the sources. In identifying the compiler with Moses, Astruc failed to profit from some of his predecessors: and the fact that he held to the traditional (Mosaic) origin of the Pentateuch may have prevented him from seeing the similarities which would have led him to continue his analysis into the remaining books of the Pentateuch.

For subsequent developments, and the fruitful results of documentary analysis as applied to the Pentateuch and other composite books, which cannot be dealt with in any detail here, reference must be made to the special articles on the books of the Old Testament.

The year of the publication of Astruc's book saw also the publication of Bishop Lowth's De sacra poesi Hebraeorum: later Lowth published a new translation of Isaiah with notes (1778). Lowth's contribution to a more critical appreciation of the Old Testament lies in his perception of the nature and significance of parallelism in Hebrew poetry, in his discernment of the extent to which the prophetic books are poetical in form, and in his treatment of the Old Testament as the expression of the thought and emotions of a people—in a word, as literature. Both Lowth's works were translated and became influential in Germany.

In spite of these earlier achievements, it is J. G. Eichhorn who has, not without reason, been termed the founder of modern Old Testament criticism. Eichhorn's De Einleitung (Introduction to the Old Testament), in 1750-1753, is a landmark in the history of Old Testament criticism. An intimate friend of Herder, himself keenly interested in literature, he naturally enough treats the Old Testament as literature—like Lowth, but more thoroughly: and, as an Oriental scholar, he treats it as an Oriental literature. In both respects he was to be widely followed. His Introduction, consisting of three closely packed volumes dealing with textual as well as literary criticism, is the first comprehensive treatment of the entire Old Testament as literature. Much of the work is detailed work in this and other works is naturally enough provisional, but in the Introduction there emerge most of the broad conclusions of literary criticism (sometimes incomplete) which, after more than a century of keen examination by scholars unwilling to admit them, have passed by more or less general consent into the number of historical certainties or high probabilities. With his wide linguistic knowledge Eichhorn perceived that the language alone (though he also addsuces other considerations) betrays the late origin of Ecclesiastes, which he places in the Persian Period (538-332 B.C.): Canticles, too, preserves linguistic features which are not of the Solomonid age. He analyses significant stylistic peculiarities such as occur, e.g., in Isaiah xxiv-xvii. For various reasons (here following Koppe, who just previously in additions to his translation of Lowth's Isaiah had shown himself the pioneer of the higher criticism of the book of Isaiah) he argues that "in our Isaiah are many oracles not the work of this prophet." In other directions the still powerful influence of tradition affects Eichhorn. He maintains the exilic origin of parts of Daniel, though he is convinced (here again in part by language) of the later origin of other parts. His Pentateuchal criticism is limited by the tradition of Mosaic authority: but even within these limits he achieves much. He carries through, as Astruc had done, the analysis of Genesis into (primarily) two documents; he draws the distinction between the Priest's Code, of the middle books of the Pentateuch, and Deuteronomy, the people's law book; and admits that even the books that follow Genesis consist of different documents, many incomplete and fragmentary (whence the theory became known as the "Fragment-hypothesis"), but all the work of Moses and some of his contemporaries.

Other literary critics of the same period or a little later are Alex. Geddes, a Scottish Catholic priest, who projected, and in part carried out (1792-1810), a new translation of the Old Testament, and argued therein that the Pentateuch ultimately rests on a variety of sources partly written, partly oral, but was compiled in Canaan probably in the reign of Solomon; K. D. Igen, the discoverer (1798) that there were two distinct documents in Genesis using the divine name Elohim, and consequently that there were three main sources in the books, not two, as Astruc and Eichhorn had conjectured; and J. S. Astruc, the elaborator of the "Fragment-hypothesis." But the next distinct stage is reached when we come to De Wette, whose contributions to Biblical learning were many and varied, but who was pre-eminent in historical criticism. De Wette.

He carried criticism beyond literary analysis and literary appreciation to the task of determining the worth of the documents as records, the validity of the evidence. His peculiar qualities were conspicuous in his early and exceedingly influential work—the Beitrag zur Einleitung in das Alte Testament (1806-1809). In the introduction to vol. ii, he carefully analyses the principles of sound historical method and the essence of a trustworthy historical record. These principles he applied to the Old Testament, firstly to the Books of Chronicles, and then to the Pentateuch. The untrustworthiness of Chronicles—briefly admitted by Luther—he proved in detail, and so cleared the way for that truer view of the history and religion of Israel which the treatment of Chronicles as a trustworthy record of the past hopelessly obscured. In the criticism of the Pentateuch he most influential and enduring contributions to criticism are his proof that Deuteronomy is a work of the 7th century B.C., and his insistence that the theory of the Mosaic origin of all the Pentateuchal books must be abandoned. His work was the fullest with the history of Israel as described in the historical books, Judges, Samuel, and Kings.

Strong in historical criticism, De Wette was weak in historical construction. But what he failed to give, Ewald supplied, and if more of De Wette's than of Ewald's work still stands to-day, that is but an illustration of the melancholy fact that in history negative criticism is surer than positive construction. But Ewald's History of the People of Israel (1843-1859) was the first great attempt to synthesize the results of the new criticism into a living and coherent presentation of the great reality of the past. By the force of his wise learning and even more of his personality, Ewald exercised for long an all-pervading and almost irresistible influence. He closes one epoch of Old Testament criticism; by his influence he retards the development of the next. Before passing to the new epoch it must suffice to make a simple reference to the philological work of Gesenius and Ewald, which assisted a sounder exegesis and so secured for later criticism a more stable basis.

The next stage brings us to the critical theories or conclusions which at first gradually and then rapidly, in spite of the keenest opposition, were carried through. They divide into two, the one more or less completely to tradition and by the representatives of the earlier critical school, gained increasing acceptance, until to-day they dominate Old Testament study. The historico-critical starting-point of the movement was really furnished by De Wette: but it was Vatke who, in his Biblische Theologie wissenschaftlich dargestellt (1835), first brought out its essential character. The fundamental peculiarity of the movement lies in the fact that it is a criticism of what is supreme in Israel—its religion, and that it has rendered possible a true appreciation of this by showing that, like all living and life-giving systems of thought, belief and practice, the religion of Israel was subject to development. It seized on the prophetic element, and not the ceremonial, as containing what is essential and unique in the religion of Israel. In literary criticism its fundamental thesis, stated independently of Vatke and in the same year by George in Die älteren jüdischen Feste, and in a measure anticipated by Reuss, who in 1832 was maintaining in his academical lectures that the prophets were older than the Law and the Psalms more recent than both, is that the chronological order of the three main sources of the Hexateuch is (1) the prophetic narratives (JE), (2) Deuteronomy, (3) the Priestly portions, and that the last is the most ancient. This entirely reversed the prevailing view that P with its exact details and developed ceremonial and sacerdotal system was at once the earliest portion
of the Pentateuch and the Grundschrift or foundation of the whole—a view that was maintained by Ewald and, though with very important modifications, to the last by A. Dillmann (d. 1894). Inherent in this view of religious development and the new critical position were far-reaching changes in the literary, historical and religious criticism of the Old Testament: these have been gradually rendered clear as the fundamental positions on which they rest have been secured by the manifold work of two generations of scholars.

The principle advanced before Vatke's point of view gained any considerable number of adherents. This is significant. In part it may fairly be attributed to the retarding influence of the school of Ewald, but in large part also to the fact that Vatke, a pupil of Hegel, had developed his theory on a priori grounds in accordance with the principles of Hegel's philosophy of history. It was only after a fresh and keener observation of facts that the new theory made rapid progress. For that, when it came, much was due to the work of Graf (a pupil of Reuss, whose Geschichtliche Bücher des Alten Testaments appeared in 1860); to the Dutch scholar Wellhausen, who, starting from the earlier criticisms, over to the new, made it the basis of his Religion of Israel (1869-1879), a masterly work and a model of sound method, and continued to support it by a long series of critical essays in the Theologisch Tijdschrift; and to Wellhausen, who displayed an unrivalled combination of grasp of details and power of historical construction: his Prolegomena zur Geschichte Israels was published in 1878 and translated into English in 1885; the history itself, Israeldische u. jüdische Geschichte, followed twenty years later, after much further critical work had been done in the meantime. Not a little also was due to Colenso (The Pentateuch... critically examined, pt. i., 1862), who, though he never entirely accepted the new position, contributed by his searching analysis of the unreality of P's narrative to the formation (for example, in the mind of Kuenen) or ratification of the judgment on that work which is fundamental to the general theory.

This sketch of the critical movement has now been brought down to the point at which the comprehensive conclusions which still dominate Old Testament study gained clear expression and were shown to be drawn from the observation of facts. Where, in particular, started from the earlier criticism, it does not fall within the scope of this article to examine the validity of these conclusions, nor even to notice the various subsidiary or consequential conclusions. Nor again is it possible to survey the more special developments of literary criticism which have later emerged, amongst which one of the most important has been the radical examination of the prophetic writings introduced and developed by (amongst others) Stade, Wellhausen, Duhm, Cheyne, Marti.1

The starting-point of this newer criticism of the prophets is the clearer practical recognition of the fact that all pre-exilic prophecy has come down to us in the works of post-exilic editors, and that for the old statement of the problem of the prophetic books—What prophecies or elements in Isaiah, Jeremiah and the rest are later than these prophets?—is to be substituted the new critical question—From these post-exilic collections how are the pre-exilic elements to be extracted? Bound up with this question of literary criticism is the very important question of the origin and development of the Messianic idea.

But two things, the extent of the influence of criticism and the relation of archaeology and criticism, yet remain for consideration. It does not fall within the scope of this article just to indicate some other problems awaiting solution.

It is one thing for scholars to reach conclusions: it is another for these conclusions to exercise a wide influence in the Churches and over general culture. In the 16th century we find obiter dicta of the Reformers challenging traditional opinions on the origin and character of the Old Testament; in the 17th century, among certain isolated scholars, elementary critical surveys of the whole field, which exercised, however, no extensive influence. Nor was it till late in the 18th century that criticism seriously challenged the dominance of the Protestant scholastic treatment of the Old Testament on the one hand, and the rough and ready, uncritical explanations or depreciations of the Rationalists on the other. But Eichhorn's Introduction appealed to more than technical scholars: its influence was great, and from that time forward criticism gradually or even rapidly extended its sway in Germany. Very different was the case in England; after Geddes and Lowth, at the close of the 18th, till far down into the 19th century, the attitude even of scholars (with rare exceptions) was hostile to critical developments, and no independent critical work was done. Pusey indeed studied under Eichhorn, and in his Historical Enquiry into the probable causes of the Rationalist Character lately predominant in German Theology (1829-1830) speaks sympathetically of the attitude of the Reformers on the question of Scripture and in condemnations of the late anti-establishmentist doctrine; in his book he shows no receptivity for any of the actual critical conclusions of Eichhorn and his successors, and subsequently threw the weight of his learning against critical conclusions—notably in his Commentary on Daniel (1846).

Dean Stanley owed something to Ewald and spoke warmly of him, but the Preface to the History of the Jewish Church in which he does so bears eloquent testimony to the general attitude towards Old Testament criticism in 1862, of which we have further proof in the almost unanimous disapprobation and far-spread horror with which Colenso's Pentateuch, pt. i., was met on its publication in the same year.

From 1860 T. K. Cheyne worked indefatigably as a resourceful pioneer, but for many years, in view of the prevailing temper, with "extreme self-suppression" and "willingness to concede to tradition all that could with any plausibility be conceded" (Cheyne, Origin of the Psalter, p. 15); more especially is his influence observable after 1890, when he published his Bampton Lectures, the Origin of the Psalter, a work of vast learning and keen penetration, without restraint on the freedom of his judgment—always stimulating to the students and scholars, but with no mixed thoughts conveyed between numbers with him. From about 1880 the prevailing temper had changed; within a decade of this date the change had become great; since then the influence of Old Testament criticism has grown with increased acceleration. The change in the former period with regard to a single point, which is however typical of many, is briefly summed up by Dr Cheyne: "In 1880 it was still a heresy to accept with all its consequences the plurality of authorship of the Book of Isaiah; in 1890 to a growing school of churchmen this has become an indubitable fact" (Origin of the Psalter, xv.). By 1906 this plurality of authorship had become almost a commonplace of the market. Many, particularly of late, have contributed to the wide distribution, if not of the critical spirit itself, yet at least of a knowledge of its conclusions. To two only of the most influential is it possible to make more definite reference—to W. Robertson Smith and S. R. Driver. From 1875 onwards Smith contributed to the 9th edition of the Encyclopaedia Britannica a long series of important articles, which, together with the articles of Cheyne, Wellhausen and others, made that work an important factor in the change which was so far over English thought in regard to the Bible; in 1878, by his pleadings in the trial for heresy brought against him on the ground of these articles, he turned a personal defeat in the immediate issue into a notable victory for the cause which led to his condemnation; and subsequently (in 1880), in two series of lectures, afterwards published3 and widely read, he gave a brilliant, and, as it proved, to a rapidly increasing number a convincing exposition of the criticism of the literature, history and religion of Israel, which was already represented in Germany

3 The Old Testament in the Jewish Church (1881); The Prophets of Israel (1882).
by Wellhausen and in Holland by Kuenen. In 1891 Dr Driver published his Introduction to the Literature of the Old Testament (6th ed., 1897); less popular in form than Smith's lectures, it was a more systematic and comprehensive survey of the whole field of the literary criticism of the Old Testament. The position of the author as regius professor of Hebrew at Oxford and canon of Christ Church in succession to Pusey, and his well-established reputation as a profound Hebrew scholar, commanded wide attention; the qualities of the book itself—its marked sobriety, its careful discrimination between the differing degrees of truth and the different justifications of conclusions and suggestions, and in general its soundness of method—rapidly extended the understanding of what Old Testament criticism is and commanded acceptance of the well-established conclusions.

No less rapid has been the change in America during the same period, nor less numerous the scholars well equipped to pursue the detailed investigation involved in critical study or those who have shown ability in popular presentations of the critical standpoint. Pre-eminent amongst these is C. A. Briggs, whose influence has been due in part to a large and varied body of work (Biblical Study, 1889, and many articles, however since) and in part to his organization of unit ed critical, international and interconfessional labour, the chief fruits of which have been the Hebrew Lexicon (based on Gesenius, and edited by F. Brown, one of the most eminent of American scholars, S. R. Driver and himself), and the International Critical Commentary. Other important works in which English and American scholars have co-operated are the Encyclopaedia Biblica (1899-1903) and Hastings' Bible Dictionary (1898-1904)—the latter less radical, but yet on the whole based on acceptance of the fundamental positions of Tatske, Graf, Wellhausen. Between either of these and Smith's Dictionary of the Bible (1863) yawns a great gulf. Space forbids any attempt to sketch here the special growth of criticism in other countries, such as France, where the brilliant genius of Renan was in part devoted to the Old Testament, or within the Roman Catholic Church, which possesses in Père Lacrange, for example, a deservedly influential critical scholar, and in the Revue Biblique an organ which devotes much attention to the critical study of the Old Testament.

Rapid and extensive as has been the spread of critical methods, there have not been lacking antiquitatis. Many of these have been not only apologetic, but unscrupulous; that is, however not the case with all. In Dr James Orr's learned work, The Problem of the Old Testament considered with reference to Recent Criticism (1906), the author's chief aim is to prove insecure the fundamental positions of the now dominant school of criticism.

In view of extensive misconceptions occasioned by many of these antiquitatis, it needs to be pointed out that terms like "criticism," "higher criticism," "critics" are often loosely used: criticism is a method, its results are many, again, many of the results or conclusions of criticism are mutually independent, while others are interrelated and depend for their validity on the validity of others. For example, among the generally or largely accepted critical conclusions are these: (1) Moses is not the author of the whole Pentateuch; (2) Isaiah is not the author of Is. xl.-lxi.; (3) the book of Daniel was written in the 2nd century B.C.; (4) the Priestly Code is post-exilic; (5) most of the Psalms are post-exilic. Now 1, 2, 3 are absolutely independent—if 1 were proved false, 2 and 3 would still stand; and so with 2 and 3; so also 2 and 3 could be proved false without in any way affecting the validity of 4. On the other hand, if 4 were disproved, 4 would immediately fall through, and the strength of 5 would be weakened (as it would also by the disproof of 2), because the argument for the date of many Psalms is derived from religious ideas and the significance of these varies greatly according as the Priestly Code is held to be early or late. In view of the number of critical conclusions and the mutual independence of many of them, "higher criticism" can only be overthrown by proving the application of criticism to the Old Testament to be in itself unlawful, or else by proving the falseness or inconclusiveness of all its mutually independent judgments one by one. On examination, the authors of anti critica are generally found to disown, tacitly or openly, the first of these alternatives; for example, Prof. Sayce, who frequently takes the field against the "higher criticism," and denies, without however, disproving, the validity of the literary analysis of the Hexateuch, nevertheless himself asserts that "no one can study the Pentateuch ... without perceiving that it is a compendium, and that the authors, has made use of a large variety of older materials," and that "it has probably received its final shape at the hands of Ezra" (Early History of the Hebrews, 129 and 134). This is significant enough; Prof. Sayce, the most brilliant and distinguished of the "anti-critics," does not really recoup the position of the "able and pious men" of the mid-19th century, to whom "even to speak of any portion of the Bible as a history" was "an outrage upon religion" (Stanley, Jewish Church, Preface); these may still have pioues, but they have no longer scholarly successors. Prof. Sayce does not prove his point; he abandons the Pentateuchal criticism, and the anti-critics occupy the critical position of Hobbes, Spinoza and Simon in the 17th century—whether reasonably or not must here be left an open question.

Briefly, in conclusion, it remains to consider the relation of Archaeology to Criticism, partly because it is frequently asserted in the loose language just discussed that Archaeology has overthrown Criticism, or in particular the "higher criticism," and partly because Archaeology has stimulated and forced to the front certain important critical questions.

More especially since the middle of the 19th century the decipherment of Egyptian and Assyrian inscriptions and systematic excavation in Palestine and other parts of the East have supplied a multitude of new facts bearing more or less directly on the Old Testament. What has been the general effect of these new facts on traditional theories or critical conclusions?

(1) Literary Criticism. No discovery has yielded any direct testimony as to the authorship of any book of the Bible, or as to the mode or date of its composition. Any documentary analysis of the Pentateuch may be right or wrong; but archaeology contributeth unless it is true, be it on critical lines: he abandons the Pentateuchal criticism, and the anti-critics occupy the critical position of Hobbes, Spinoza and Simon in the 17th century—whether reasonably or not must here be left an open question.

allusions to particular tribes. It has contributed nothing whatsoever to our knowledge of any Hebrew individual of this period, and consequently what elements of history underlie the stories in Genesis, in so far as they relate to the Hebrew patriarchs, must still be determined, if at all, by a critical study of the Old Testament. The story in Gen. xiv. is no exception to this statement: archaeology has made probable the historic reality of Chedorlaomer, which some critics had previously divined; it has not proved the historical reality of the patriarch Abraham or the part played by him in the story, which some critics, whether rightly or wrongly, had questioned. The Dutch scholar Koster called in question the return of the Jews in the days of Cyrus; but though it is not less favored by the critics, as yet at all events, the weight of critical judgment: here again, unfortunately, archaeology at present is silent.

(3) Criticism of Religion.—Here, perhaps, archaeology has contributed its most new material, with the result that religious ideas, institutions, once supposed to be peculiar to Israel, are now seen to be common to them and other nations; in some cases, moreover, priority clearly does not lie with the Hebrews, as, for example, in the case of the materials (as distinct from the spirit in which they are worked up) of the stories of Creation and the Flood. Of late, too, it has been much argued, and often somewhat confidently maintained, that Hebrew monotheism is derivative from Babylonian monotheism.

This and similar questions, leading up to the ultimate and supreme question—Wherein does lie the uniqueness of Israel's religion?—are among those which will require in the future renewed examination in the light of a critical study alike of the Old Testament and of all the relevant material furnished by archaeology. Archaeology has not yet found the key to every unopened door; but it has already done enough to justify the surmise that if criticism had not already disintegrated the traditional stories of the Old Testament, archaeology has, in the latter half of the 19th century would itself have initiated the process.

LITERATURE.—Much of the details and results of criticism and the special literature will be found in the articles in the present work on the several books of the Old Testament. To the works already mentioned we may add L. Dietzel, Geschichte des Allen Testamentes in der christlichen Kirche (1866); C. A. Briggs, General Introduction to the Study of Holy Scripture (1889); G. A. Smith, Modern Criticism and the Preaching of the Old Testament (1901)—these for the history of criticism (for the history of the Old Testament study: T. K. Cheyne, Founders of Old Testament Criticism (pp. 1-247, biographical sketches of critical scholars since the middle of the 18th century: pp. 246-372, criticism of Driver's Introduction). As already indicated, the exposition of Literary Criticism in English is Driver's Introduction to the Literature of the Old Testament. For the general principles of Historical Criticism see Ch. V. Langlois and Ch. Seignobos, Introduction à l'étude de l'Histoire (Eng. trans., 1898), with which it is interesting to compare De Wette's brief discussion referred to in the article.

A sense of the importance of a fixed standard of chronology was only acquired gradually in the history of the world. Nations in a primitive state of civilization were not, and are not, conscious of the need. When the need began to be felt events were probably at first dated by the reigns of kings; the reigns of successive kings were then arranged in order, and grouped, if necessary, in dynasties, and thus a fixed standard was gradually constructed. Particular states also not infrequently introduced fixed eras, which obtained a more or less extensive currency, as the era of the first Olympiad (776 B.C.), of the foundation of Rome (753 B.C.), and of the Seleucidae at Antioch (321 B.C.), which is followed by the Jewish author of the first book of Maccabees. Some of the earliest documents which we possess are dated by the year in which some noticeable event took place, as in contract-tablets of the age of Sargon of Agade to whom many possible of overrating the case it is necessary to refer here to the fact that Tethmisios (Thothmes III) in the 16th century B.C. mentions two Palestinian places named respectively Jacobel and Josephel, and Sheshonk in the 19th century B.C. mentions another called "The field of Abram." From these names alone it is impossible to determine whether the places derived their names from individuals or tribes.

(Akkad) (3800 B.C., or, according to other authorities, 2800 B.C.), "In the year in which Sargon conquered the land of Amurru [the Amorites];" or, "In the year in which Samsu-ditana [c. 1950 B.C.] made the statue of Marduk": Is. vi. 1 ("In the year of King Uzziah's death "); xiv. 28, xx. 1, are examples of this method of dating found even in the Old Testament. In process of time, however, the custom of dating by the regnal year of the king became general. The Babylonians and Assyrans were probably the first to construct and employ a fixed chronological standard; and the numerous contract-tablets, and list of kings and yearly officials, discovered within recent years, afford striking evidence of the precision with which they noted chronological details. Biblical chronology is, unfortunately, in many respects uncertain. Prior to the establishment of the monarchy the conditions for securing an exact and consecutive chronology did not exist; the dates in the earlier period of the history, though apparently in many cases precise, being in fact added long after the events described, and often (as will appear below) resting upon an artificial basis, so that the precision is in reality illusory. And after the establishment of the monarchy, though the conditions for an accurate chronology now existed, errors by some means or other found their way into the figures; so that the dates, as we now have them, are in many cases not to be considered as exact as much as to three decades of years. The exact dates of events in Hebrew history can be determined only when the figures given in the Old Testament can be checked and, if necessary, corrected by the contemporary monuments of Assyria and Babylonia, or (as in the post-exilic period) by the knowledge which we independently possess of the chronology of the Persian kings. In the following parts of this article the chronological character of each successive period of the Old Testament history will be considered and explained as far as the limits of space at the writer's disposal permit.

1. From the Creation of Man to the Exodus.—In the whole of this period the chronology, in so far as it consists of definite figures, depends upon that part of the Pentateuch which is called by critics the "Priestly Narrative." The figures are in most, if not in all cases, artificial, though the means now fail us of determining upon what principles they were calculated. It is also to be noted that in the Samaritan text of the Pentateuch, and in the LXX., the figures, especially in the period from the Creation to the birth of Abraham, differ considerably from those given in the Hebrew, yielding in Sam. a lower, but in the LXX. a much higher total. The following tables will make the details clear:

<table>

Total from the Creation of Man to the Flood 1656 1307 2262

The figures in parentheses indicate the entire ages assigned to the several patriarchs; these are generally the same in the three texts. The Sam., however, it will be noticed, makes in three cases the father's age at the birth of his eldest son less than it is in the Heb. text, while the LXX. makes it in several cases as much as 100 years higher, the general result of these differences being that the total in the Sam. is 349 years less than in the Heb., while in the LXX. it is 666 years more. The names, it need hardly be remarked, belong to the prehistoric period, and equally with the figures are destitute of historical value.

* Or, according to some MSS. 167.

The variations are analogous to those under (1), except that here the birth-years of the patriarchs in both Sam. and LXX. differ more consistently in one direction, being, viz., almost uniformly higher by 100 years. It has been much debated, in both cases, which of the three texts preserves the original figures. In (2) it is generally agreed that the Heb. does this, the figures in Sam. and LXX. having been arbitrarily increased for the purpose of lengthening the entire period. The majority of scholars hold the same view in regard also to (1), but Dillmann gives here the preference to the figures of the Sam. The figures, of course, in no case possess historical value: accepting even Ussher's date of the Exodus, 1491 B.C., which is earlier than is probable, we should obtain from them for the creation of man 4157 b.c., or (LXX.) 5382, and for the confusion of tongues, which, according to Gen. xi. 1-9, immediately followed the Flood, 2501 b.c., or (LXX.) 3066 b.c. But the monuments of Egypt and Babylonia make it certain that man must have appeared upon the earth long before either 4157 b.c. or 5382 b.c.; and numerous inscriptions, written in three distinct languages—Egyptian, Sumerian and Babylonian—are preserved dating from an age considerably earlier than either 2501 b.c. or 3066 b.c. The figures of Gen. v. and xi. thus merely indicate the manner in which the author of the Priestly Narrative—and probably to some extent tradition before him—pictures the course of these early ages of the world’s history. The ages assigned to the several patriarchs (except Enoch) in Gen. v. are much greater than those assigned to the patriarchs mentioned in Gen. xi., and similarly the ages in Gen. xi. 10-18 are higher than those in Gen. xi. 19-26; thus a collateral aim of the author to exemplify the supposed gradual diminution in the normal years of human life. The Babylonians, according to Berosus, supposed that there were ten antediluvian kings, who they declared had reigned for the portentous period of 432,000 years: 432,000 years, however, it has been ingeniously pointed out by Oppert (Göt. Ge. Nachrichten, 1877, p. 205 ff.) =86,000 lustra, while 1656 years (the hebrew date of the Flood) =86,000 weeks (1656 =72 x231; and 23 years being 8395 days +5 intercalary days =8400 days =1200 weeks); and hence the inference has been drawn that the two periods have in some way been developed from a common source, the Hebrews taking as their unit a week, where the Babylonians took a lustrum of 5 years.

(3) From the Call of Abraham to the Exodus.

| Age of Isaac at the birth of Isaac (Abraham being then aged 100, Gen. xi. 5.) | 25 years |
| Age of Isaac at the birth of Esau and Jacob (Gen. xxv. 26) | 60 |
| Age of Jacob when he went down into Egypt (Gen. xlvi. 9) | 130 |
| **The period of the Patriarchs' sojourn in Canaan** | **215** |
| But the period of the Israelites' sojourn in Egypt, according to Ex. xii. 40, 41, was | **430** |

1. Shem, the father of Arphaxad, is aged 100 at the time of the Flood, and lives for 600 years.
2. Disregarding the "two years" of Gen. xi. 10: see v. 32, vii. 11.
3. Taking account of the reading of LXX. in Ex. xii. 40.

---

**We thus get—**

- From the Call of Abraham to the Exodus ( Heb. text) | 215-430 = 645 years
- From the Flood to the Call of Abraham ( Heb. text) | 365
- From the Creation of Man to the Flood (Heb. text) | 1656
- From the Creation of Man to the Exodus ( Heb. text) | 2666

On these figures the following remarks may be made:—(I) In Genesis the chronology of the Priestly Narrative (" P") is not consistent with the chronology of the other parts of the book ("JE"). Three or four illustrations will suffice:

- (a) The author of Gen. xii. 10-20 evidently pictures Sarai as a comparatively young woman, yet according to P (xii. 4, xviii. 17) she was 65 years old.
- (b) In Gen. xxii. 15 it is clearly implied that Ishmael has been carried by his mother, yet according to xvi. 16, xxi. 5, 8, he must have been at least 15 years old.
- (c) In Gen. xxvii. Isaac is to all appearance on his deathbed (cf. ver. 2), yet according to P (xxv. 26, xxvi. 34, xxxv. 28) he survived for eighty years, dying at the age of 180. Ussher and others, taking the dates from the Jewish one and adding them, have obtained 346, xxxi. 41, infer that Jacob's flight to Haran took place in his 77th year. This reduces the 80 years to 43 years, though that is scarcely less incredible. It involves, moreover, the incongruity of supposing that thirty-seven years elapsed between Esau's marrying his Hittite wives (xxiv. 34) and Rebekah's expressing her apprehensions (xxxv. 46) lest Jacob, then aged seventy-seven, should follow his brother's example.
- (d) In Gen. xlv. 20 Benjamin is described as a "little one"; in P, almost immediately afterwards (xlv. 21), he appears as the father of ten sons; for a similar anomaly in xlvii. 12, see the Oxford Hexateuch, i. p. 259.

(ii.) The ages to which the various patriarchs lived (Abraham, 175; Isaac, 180; Jacob, 147), though not so extravagant as those of the antediluvian patriarchs, or (with one exception) as those of the patriarchs between Noah and Abraham, are much greater than is at all probable in view of the structure and constitution of the human body. (iii.) The plain intention of Ex. xii. 40, 41 is to describe the Israelites as having dwelt in Egypt for 430 years, which is also in substantial agreement with the earlier passage, Gen. xiv. 13 ("shall sojourn in a land that is not theirs, ... and they shall afflict them 400 years.") It does not recognize the Exodus, according to the dates in xvi. 9, xlvii. 24, only four generations from Jacob's children to Moses (Ex. vi. 16-20; Num. xxvi. 5-9; cf. Gen. xvi. 16), or five to Joshua (Jos. vii. 1); and for this reason, no doubt, the Sam. and LXX. read in Ex. xii. 40, "The sojourning of the children of Israel in the land of Egypt, and in the land of Canaan, was 430 years," reducing the period of the sojourn in Egypt to half of that stated in the Hebrew text, viz. 215 years. This computation attained currency among the later Jews (Josephus and others; cf. the "400 years" of Gal. iii. 17). The forced and unnatural rendering of Ex. xii. 40 in the A.V. (contrast R.V.), which was followed by Ussher, is intended for the purpose of making it possible. From the facts that have been here briefly noted it must be evident how precarious and, in parts, how impossible the Biblical chronology of this period is.

(iv.) It has been observed as remarkable that 2666, the number of years (in the Hebrew text) from the Creation of Man to the Exodus, is, in round numbers, just two-thirds of 4000; and the fact has suggested the inference that the figure was reached by artificial computation.

**The Date of the Exodus:** Is it possible to determine this, even approximately, upon the basis of external data? (I.) The correspondence between the Egyptian governors established in different parts of Palestine and the Egyptian kings Amenhotep (Amenophis) III. and IV. of the 18th dynasty, which was discovered in 1887 at Tel el-Amarna, makes it evident that Palestine could not yet have been in the occupation of the Israelites. It was still an Egyptian province, and the Babylonian language, in which the correspondence is written, shows that the country must have been for a considerable time past, before it came into the possession of Egypt, under Babylonian
influence. Now one of the kings, who corresponds with Amen-\(\mathrm{hotep}\) IV, is Burnubiriai (Burna-buryas), king of Babylon, and Egyptologists and Assyriologists are agreed that the dates of these monarchs was c. 1400 B.C. The conquest of Canaan, consequently, could not have taken place till after 1400 B.C.

(ii.) It is stated in Ex. i. 11 that the Israelites built in Egypt for the Pharaoh two store-cities, Pithom and Ramesses. The excavations of M. Naville have, however, shown that Ramses II. of the 19th dynasty was the builder of Pithom; and though the other city has not at present been certainly identified, its name is sufficient to show that he was its builder likewise. Hence the Pharaoh of the Exodus is commonly supposed to have been Ramses II., the successor of Merenptah (XII. 31, 32). The Egyptian chronology is unfortunately imperfect; but Professor Petrie, who has paid particular attention to the subject, and who assigns the reign of Amen-\(\mathrm{hotep}\) IV. to 1383-1365 B.C., assigns Ramses II. to 1300-1234 B.C.¹

In Merenptah’s fifth year the Delta was invaded by a formidable body of Libyans and other foes; and it has been conjectured that the Israelites took the opportunity of escaping during the unsetlement that was thus occasioned.

Alternative dates for Ramses II.: Maspero, The Struggle of the Nations (1897), p. 440, c. 1320-1255; Breasted; (XII. 31, 32); Meyer (1900), 1310-1244. Attempts have been made to identify the Khabiri, who are mentioned often in the Tel el-Amarna letters as foes, threatening to invade Palestine and bring the Egyptian supremacy over it to an end with the Hebrews. The Egyptian Khabiri has been pointed out, might then be placed under Amen-\(\mathrm{hotep}\) II. (1448-1420 B.C., Breasted; 1430-1425, Petrie), the successor of Thutmose IV, who died suddenly at the end of his reign. The events between the Exodus and the time of David (c. 1000), which, if the date given above be correct, have been thought to be unduly compressed (see Orr in the Expositor, March 1897, p. 161 fl.); but there are difficulties attaching to this view, and it has not been accepted generally by scholars. There may be some ultimate connexion between the Khabiri and the Hebrews; but the Khabiri of the Tel el-Amarna letters cannot be the Hebrews who invaded Canaan under Joshua.

The mention of Israel on the stele of Merenptah, discovered by Petrie in 1896 ("Israel [Y]Israel" is desolated; its scion [a fruit] is not "), is too vague and indefinite in its terms to throw any light on the question of the Exodus. The context speaks of places in or near Canaan; and it is possible that the reference is to Israelites clans who either had not gone down into Egypt at all, or had already found their way back to Palestine. See Hogarth’s Authority and Archaeology, pp. 62-65.

2. From the Exodus to the Foundation of the Temple (in the fourth year of Solomon, 1 Kings vi. 1).—In the chronological note, 1 Kings vi. 1, this period is stated to have consisted of 480 (LXX. 440) years. Is this figure correct? If the years of the several periods of oppression and independence mentioned in John’s Apocryphon (1 Kings ii. 1) are added up, the total does not amount to 480; but the years of the oppressions periods denoted by \(x\) and \(y\) in any case considerably more than the 480 years of 1 Kings vi. 1. This period might no doubt be reduced to 480 years by the supposition, in itself not improbable, that some of the judges were local and contemporaneous; the suggestion has also been made that, as is usual in Oriental chronologies, the years of foreign domination were not counted, the beginning of each judge’s rule being reckoned, not from the victory which brought him into power, but from the death of his predecessor; we should in this case obtain for the period from the Exodus to the foundation of the Temple 440+\(x\)+\(y\) years, which if 30 years be assigned uniquely to Joshua and the elders, and 10 years to Saul, would amount exactly to 480 years. The terms used, however ("and the land had rest forty years," ii. 11, similarly iii. 10, viii. 31), seem hardly to admit of the latter supposition; and even if they did, it would still be scarcely possible to maintain the correctness of the 480 years: it is difficult to harmonize with what, as we have seen, appears to be the most probable date of the Exodus; it is, moreover, open to itself the suspicion of having been formed artificially, upon the assumption that the period in question consisted of twelve generations² of 40 years each. In the years assigned to the different judges, also, the frequency of the number 40 (which certainly appears to have been regarded in the Hebrews as a round number) is suspicious. On the whole no certain chronology of this period is at present attainable.³

3. From the Fourth Year of Solomon to the Captivity of Judah.

—During this period the dates are both more abundant, and also, approximately, far more nearly correct, than in any of the earlier periods; nevertheless in details there is still much uncertainty and difficulty. The Books of Kings are a compilation made at about the beginning of the Exile, and one object of the compiler was to give a consecutive and complete chronology of the period embraced in his work. With this purpose in view, he has many dates of a doubtful nature, and has often amalgamated or disposed of them in both kingdoms, but also (as long as the northern kingdom existed) brings the history of the two kingdoms into relation with one another by equating the commencement of each reign in either kingdom with the year of the reign of the contemporary king in the other kingdom.

The following are examples of the standing formulae used by the compiler for the purpose:—²⁸ In the twentieth year of Jeroboam king of Israel began Asa to reign over Judah. And forty and one years he reigned he in Jerusalem (1 Kings xv. 9, 10).²⁹ "In the third year of Asa king of Judah began Baasha the son of Ahijah to reign over all Israel in Tirzah (and reigned) twenty and four years" (Ibid. ver. 35).

In these chronological notices the lengths of the reigns were determined in every case from mention or computation from the state annals—the "book of the chronicles of Israel" (or "Judah"), so constantly referred to by the compiler as his authority (e.g. 1 Kings xv. 23, 31, xvi. 5); but the "chronologies"—i.e. the corresponding dates in the contemporary reigns in the other kingdom were derived, it is practically certain, by computation from the lengths of the successive reigns. Now in some cases, perhaps, in the lengths of the reigns themselves, in other cases in the computations based upon them, errors have crept in, which have vitiated more or less the entire chronology of the period. The existence of these errors can be demonstrated in the first instance in the historical reigns of Judah; the length of the reign of Jehoram in the north at its beginning is not consistent with itself; (2) the dates of various events in the history, which are mentioned also in the Assyrian inscriptions, are in serious disagreement with the dates as fixed by the contemporary Assyrian chronology.

(i.) That the chronology of the two kingdoms is inconsistent with itself is readily shown. After the division of the kingdom the first year of Jeroboam in Israel coincides, of course, with the first year of Rehoboam in Judah; and after the death of Jehoram of Israel and Ahaziah of Judah in battle with Jehu in the north on the boundary of Israel, the years of the latter’s reign in the north commence similarly with the first year of Athaliah in Judah: there are thus in the history of the two kingdoms two fixed and certain synchronisms. Now,

¹ Namely, 40 years in the wilderness; Joshua and the elders (Judges ii. 7), x years; Othniel (iii. 11), 40 years; Eshub (iii. 30), 80 years; Barak (v. 31), 40 years; Gideon (viii. 28), 40 years; Jephthah and five minor judges (x. 2, 3, xii. 7, 9, 11, 14), 76 years; Samson (xvi. 31), 20 years; Deborah (v. 2), 20 years; Saul, 3 years; David, 40 years; and Solomon’s first four years—in all 440+\(x\)+\(y\) years.

² Namely, Moses (in the wilderness), Joshua, Othniel, Eshub, Deborah, Gideon, Jephthah, Samson, Eli, Samuel, Saul and David.

³ The "300 years" of Judges xvi. 26 agrees very nearly with the sum of the years (namely, 319) given in the preceding chapters for the periods of oppression and independence. The verse occurs in a long insertion (xi. 12-28) in the original narrative; and the figure was most probably arrived at by computation upon the basis of the present chronology of the book.
### CHRONOLOGICAL TABLE.

The dates printed in heavy type are certain, at least within a unit.

---

1. The real Biblical date, Ussher in Gen. xi. 26 interpolating 60 years, because it is said in Acts vii. 4 that Abraham left Haran after his father Terah's death (Gen. xi. 32), and also (as explained above) interpreting wrongly Ex. xii. 40.

2. Petrie's dates, Hist. of Egypt, vol. i. (ed. 5, 1903), pp. 20, 30, 233, 251, 252; vol. iii. (1905), pp. 2, 235, 281-2, 296-306. Other authorities, however, assign comparatively lower dates for the dynasties prior to the 10th. Thus Breasted (Hist. of Egypt, 1906, pp. 22 ff., 221, 597) agrees with Ed. Meyer in giving, for reasons which cannot be here explained, for the beginning of the 1st dynasty c. B.C. 3400, for the 4th dynasty c. B.C. 2900-2790, and for the rule of the Hyksos c. B.C. 1680-1580; and in his Researches in Sinai, 1906, p. 175, Petrie proposes for Menes B.C. 5510, and for the 4th dynasty B.C. 4731-4454. See Egypt (Chronology).

3. So Sayce, Rogers (Hist. of Bab. and Ass., 1900, i. 318 f.) and others. The date rests upon a statement of Nahu-ana'idh, that Sargon's son, Narâm-Sin, reigned 3200 years before himself. Lehmann holds that there are reasons for believing that the engraver, by error, put a stroke too many, and that 2200 should be read instead of 3200.

4. Rogers, i. 373-375. Many monuments and inscriptions of other kings in Babylonian, between 4000 and 2000 B.C., are also known.

5. The lists of the Babylonian and Assyrian kings are not continuous; and before 1907, from the data then available (see the discussion in Rogers, op. cit. i. 312-345), Khammarabi, the sixth king of the first Babylonian dynasty, was commonly referred to such dates as 2376–2333 B.C. (Sayce), or 2285-2242 B.C. (Johns). But inscriptions recently discovered, by showing that the second dynasty was partly contemporaneous with the first and the third, have proved that these dates are too high: see L. W. King, Chronicles Concerning Early Bab. Kings (1907), i. 93-110; and the article BABYLONIA, Chronology. The date B.C. 2120-2088 is that adopted by Thureau-Dangin, after a discussion of the subject, in the Journal des Savants, 1909; and by Ungnad in the Orient. Lit.-zeitung, 1908, p. 13, and in Grossmann's Altorientalische Texte und Bilder zum A.T. (1909), p. 103.

7. The dates of the kings are, in most cases, those given by Kautzsch in the table in his Outline of the Hist. of the Literature of the O.T. (tr. by Taylor, 1896), pp. 167 ff.; see also A. R. S. Kennedy, "Samuel" in the Century Bible (1903), p. 31. The dates given by other recent authorities seldom differ by more than three or four years.

8. In the figures after a king's name indicate the number of years assigned to his reign in the O.T. For Saul, see 1 Sam. xiii. 1, R.V.

9. The date of Sheshonq depends on that fixed for Rehoboam. Petrie places the accession of Rehoboam in 937 B.C.

1 If these dates are correct, there must be some error in the ages assigned to Ahaz and Hezekiah at their accession, viz. 20 and 25 respectively, for it would otherwise follow from them that Ahaz, dying at the age of 20 [or 48?] 28, left a son aged 25! The date 729 for Hezekiah's accession rests upon the assumption that of the two inconsistent dates in 2 Kings xxix. 16, 13, the one in ver. 16 (which places the fall of Samaria in Hezekiah's 6th year) is correct; but some scholars (as Wellhausen, Kamphausen, and Stade) suppose that the date in ver. 10 (which places Sennacherib's invasion in Hezekiah's 14th year) is correct, and assign accordingly Hezekiah's accession to 715. This removes, or at least mitigates, the difficulty referred to, and leaves more room for the reigns of Jotham and Ahaz; but it requires, of course, a corresponding reduction in the reigns of the kings succeeding Ahaz.

2 Breasted's dates for these three kings (Hist. of Egypt, 1906, p. 601) are: Shabaka 712–700; Shabataka 700–688; Taharqa 688–663.

Palestine now becomes a province, first of the empire of Alexander, and afterwards of that of one or other of Alexander's successors.

332. The Jews submit to Alexander the Great.
323. Death of Alexander in Babylon.
322. Alexander's general, Ptolemy Lagi, becomes Satrap of Egypt.
320. Ptolemy Lagi gains possession of Palestine, which, with short interruptions, continues in the hands of the Ptolemies till 198.
312. Beginning of the era of the Seleucidae (reckoned from the time when Seleucus Nicator, Alexander's former heavy cavalry officer, finally established himself in the satrapy of Babylonia. He founded Antioch as his capital, 300 B.C.);
305. Ptolemy Lagi assumes the title of king.
198. Antiochus the Great, king of Syria (223-187), defeats Ptolemy Euphranor at Panias (Baniyas, near the sources of the Jordan), and obtains possession of Palestine.
175-164. Antiochus Epiphanes, king of Syria (164-132).
168. Antiochus's attempt to suppress the religion of the Jews (1 Macc. i. 41-63; cf. Dan. vii. 8, 21; 24-26, viii. 9-14, xii. 10-12). Public worship suspended in the Temple for three years.
167. Rise of the Maccabees (1 Macc. iii.).
169-165. Victories of Judas Maccabaeus over the generals of Antiochus (1 Macc. iii.-iv.).
165. Re-dedication of the Temple on 25th Chisleu (December), 1 Macc. iv. 52-61.
142-135. Simon, elder brother of Judas (1 Macc. xii.-xvi.).
105-104. Aristobulus I. (son of Hyrcanus), king.
104-78. Alexander Jannaeus (brother of Aristobulus), king.
78-69. Salome (Alexandra), widow of Alexander Jannaeus.
69-57. Aristobulus II. (son of Alexander), king.
57-55. Capture of Jerusalem by Pompey. Palestine becomes a part of the Roman province of Syria.

If the regnal years of the kings of Israel from Jeroboam I to Joram be added together, they will be found to amount to 98, while if those of the kings of Judah for the same period (viz. from Rehoboam to Ahaziah) be added together, they amount only to 55. This discrepancy, if it stood alone, would not, however, be serious. But when we proceed to add up similarly the regnal years in the two kingdoms from the division after Solomon's death to the fall of Samaria in the sixth year of Hezekiah (2 Kings xvii. 10), we find in the southern kingdom 260 years, and in the northern kingdom only 241 years 7 months. This is a formidable discrepancy. Ussher, in order to remove it, has recourse to the doubtful expedient of artificially lengthening the northern series of years, by assuming (without any authority in the text) an "interregnum of 11 years" after the death of Jeroboam II, and an "anarchy for some years" between Pekah and Hoshea (see the margin of A. V. at 2 Kings xiv. 29; xv. 8, 20).

(2) As we now know, the methods of chronological computation adopted by the Assyrians were particularly exact. Every year a special officer was appointed, who held office for that year, and gave his name to the year; and "canons," or lists, of these officers have been discovered, extending from 893 to 666 B.C. The accuracy of these canons can in many cases be checked by the full annals which we now possess of the reigns of many of the kings—as of Asshur-na'r'abal or Assur-na'r-pal (883-860 B.C.), Shalmaneser II. (860-852), Tiglath-pileser IV. (745-727), Sargon (722-705), Sennacherib (704-711), Esarhaddon (681-669), and Ashurbanipal or Assur-bani-pal (669-626).

Thus from 893 B.C. the Assyrian chronology is certain and precise. Reducing now both the Assyrian and Biblical dates to a common standard, and adopting for the latter the computations of Ussher, we obtain the following singular series of discrepancies:

<table>
<thead>
<tr>

<td>Manifestly all the Biblical dates earlier than 733-732 B.C. are too high, and must be considerably reduced: the two events, also, in Hezekiah's reign—the fall of Samaria and the invasion of Sennacherib—which the compiler of the book of Kings treats as separated by an interval of eight years, were separated in reality by an interval of twenty-one years.</td>

2 It may be explained here that the dates of the Assyrian and Babylonian kings can be reduced to years B.C. by means of the so-called "Canon of Ptolemy," which is a list of the Babylonian and Persian kings, with the lengths of their reigns, extending from Naborassar, 747 B.C., to Alexander the Great, drawn up in the 2nd century. A.D. by the celebrated Egyptian mathematician and geographer Ptolemy: as the dates B.C. of the Persian kings are known independently, from Greek sources, the dates B.C. of the preceding Babylonian kings can, of course, be at once calculated by means of the Canon. The recently-discovered contemporary monuments have fully established the accuracy of the Canon.
3 Or, in any case, between 734 and 732; see Rost, *Die Keilschrifttexte Tiglath-pileser III.*, 1693, pp. xii., 39, 81, with the discussion, pp. xxxii., xxxiv., xxxv., xxxvii., xxxviii.
4 This interval does not depend upon a mere list of Eponym years: we have in the annals of Sargon and Sennacherib full particulars of the events in all the intervening years.
Much has been written on the chronology of the kings and many endeavours have been made to adjust the Biblical figures so as to bring them into consistency with themselves and at the same time into conformity with the Assyrian dates. But, though the fact of there being errors in the Biblical figures is patent, it is not equally clear at what points the errors lie, or how they are to be readjusted, though not to be redistributed between the various reigns. It is in any case evident that the accession of Jehu and Athaliah must be brought down from 884 to 842 B.C.; and this will involve, naturally, a corresponding reduction of the dates of the previous kings of both kingdoms, and of course, at the same time, of those of Solomon, David and Saul. The difficulty is, however, greatest in the 8th century. Here, in Judah, from the accession of Athaliah to the accession of Ahaz, tradition gives 143 years, whereas, in fact, there were but 106 years (842-736); and in Israel, from the death of Menahem to the fall of Samaria, it gives 31 years, whereas from 735 (assuming that Menahem died in that year) to 722 there are actually only 16 years. The years assigned by tradition to the reigns in both kingdoms in the middle part of the 8th century B.C. have thus to be materially reduced. But in the following period, from the fall of Samaria in 722 to the capture of Jerusalem by the Chaldaeans in 586, the Biblical dates, so far as we can judge, are substantially correct. (See further the table above.)

4. From the Destruction of Jerusalem in 586 to the close of the Old Testament History.—Here, though it is true that there are events in the Biblical history which are not fully or unambiguously dated, there is otherwise no difficulty. The lengths of the reigns of Nebuchadrezzar and his successors on the throne of Babylon, and also, after the conquest of Babylon, of Cyrus and the following Persian kings, are known from the “Canon of Ptolemy,” referred to above, the particulars in which, for the earlier part of this period, are also confirmed by the testimony of the monuments.

See, for further information on the subject, the article CANON, and the same heading in the Encyclopedia Biblica, cols. 773-799, with the literature referred to on col. 819 (especially the writings of Nöldeke, Wellhausen, and Kamphausen there mentioned). (S. R. D.)

(B) New Testament

1. Canon.

The New Testament is the collection of the Sacred Books of Christians. It forms in the Bible the distinctive possession of Christians, just as the Old Testament is the collection of Sacred Books which Christians share with Jews. Every term in the definition is significant and has a history. There are, first, the Books; then, the Collection; then, the Sacred Volume, complete as such; and lastly, the Sacred Volume in its full dimensions, as it has come down to us.

There is a double development, of quality and quantity; of quality, as to the estimate formed of the books, their increasing recognition as sacred; and of quantity, by which the books so recognized were gradually brought up to their present number. Our duty will be to describe this double process, and we shall do so under the four heads: (a) The Growth of a specifically Christian Literature; (b) The Collection of the Books into a single volume, made up of ordered groups; (c) The investing of this volume with the character of a Sacred Book; and (d) The gradual settlement by which the volume assumed its present dimensions, neither less nor more.

The model throughout was the Old Testament. The result was attained when there was a definite volume called the New Testament by the side of the earlier volume called the Old Testament, complete like it, and like it endowed with the attributes of a Sacred Book. This is the consummation towards which events had been steadily moving—not at first consciously, for it was some time before the tendencies at work were consciously realized—but ending at last in the complete equation of Old Testament and New, and in the bracketing together of both as the first and second volumes of a single Bible. This is the process that we shall have to describe. And because the process before us is the gradual assimilation of New Testament and Old Testament, we shall have to include at each step all that bears upon this. For instance, at starting, it will not be enough for us simply to tell the story how the Books of the New Testament came to be written, but we shall have to point out with what care and solicitude the New Testament was prepared which suggested the estimate ultimately put upon them; in others, words, how they came to be not only a collection of Christian books, but a collection of Christian sacred books, or part of a Bible.

(a) The Growth of a Christian Literature. 1. The Pauline Epistles.—The Bible of Jesus and His disciples was the Old Testament. And both Jesus and His disciples were to all appearance content with this. It was probably two full decades after the death of Christ before there were any specifically Christian writings at all. The first generation of Christians was not given to writing. There was not only no obvious reason why it should write, but there was a positive reason why it should not write. This reason lay in the dominant attitude of Christians, which was what we call “eschatological.” The first generation of Christians lived in the daily expectation that Christ would return from heaven. The truth is, that not only were Christians expecting (as we say) the Second Coming of the Messiah, but what they expected was the Coming. The Messiah, as all Jews conceived of Him, was a superhuman being; and His First Comes as a man among men did not count as really Messianic. The whole first generation of Christians looked intently for His Coming in power and great glory, which they believed to be near at hand. In such a state of mind as this there was no motive for seeking permanence by writing. Men who imagined that they might at any moment be caught up to meet the Lord in the air were not likely to take steps for the instruction of the generations that might come after them.

Hence the first Christian writings were no deliberate product of theologians who supposed themselves to be laying the foundation of a sacred volume. They were not an outcome of the dominant tendencies of the time, but they arose rather in spite of them, in the simplest way, just from the practical needs of the moment.

It was thus that St Paul came to write his two epistles to the Thessalonians, the oldest Christian documents that we possess. By this time he was launched on his missionary labours; he had founded a number of churches, and he was going on to found others. And these earliest epistles are just the substitute for his personal presence, advice which he took occasion to send to his converts after he had left them. There are a few indications that he had sent similar communications to other churches before, but these have not been preserved. Indeed the wonder is—and it is a testimony to the strength of the impression which St Paul left upon all with whom he came into contact—that these missionary letters of his should have begun to be preserved so soon.

Both Epistles to the Thessalonians have for their object to calm somewhat the excited expectations of which we have spoken.

The first Epistle hits exactly the prominent features in the situation, when it reminds the Thessalonians how they had been sent to Gospel, to send a living and true God, and to wait for his Son from heaven, who would deliver them from the wrath to come (1 Thess. i. 9, 10). The turning from idols was of course peculiar to the Gentile communities, but the waiting for the Messiah from heaven was common to all Christians, whatever their origin. In this we may take the epistle as typical of the state of the whole Church at the time. And there is another important passage which shows why, in spite of its natural and occasional character, the epistle exhibits the germs of that essential quality which caused all the books of the New Testament to be highly estimated. The apostle again reminds his readers how they had received his preaching "not as the word of men, but as it is in truth, the word of God," which showed its power by the way in which it took hold of those who believed in it (1 Thess. ii. 13). The reference is of
course primarily to the spoken word, but the written word had the same qualities as the spoken. It was the deep impression made by these which prepared Christians generally to accept the apostolic writings as inspired, and therefore sacred. There is no greater mistake than to suppose that the estimate formed by the early Church of its Bible was a merely arbitrary verdict imposed by an external author as it was in the apocrypha, and the natural expression (though following certain prescribed lines), of its real sense of the value and fundamentally divine origin of the writings which it treasured.

Nearest in character to the Thessalonian Epistles are the two to Corinth, which have perhaps an interval of a year and a half between them. When 1 Corinthians was written, the attitude of the Church was still strongly eschatological (1 Cor. i. 7, 8, ii. 13-15, vii. 26, 29-31, xv. 25, 26, 51-54, xvi. 23). The thoughts of men were still set upon the near approach of the end, the troublesome times that would issue in the break-up of the existing order and the return of Christ to introduce a new era. There was no idea of constructing a systematic theology; Christ was still the Jewish Messiah, and His Coming was conceived of as the Jews conceived of the coming of the Messiah, as a great supernatural event transforming the face of things and inaugurating the reign of God. In view of this approaching revolution, both the Church and the world were regarded as living from hand to mouth. It was useless to attempt to found permanent institutions; everything was provisional and for the moment. And yet, even under these conditions, some professionals distinguished something that it is often difficult to make up with matters of this kind; either the apostle is reproving disorders and abuses actually existing in the Church, and almost sure to exist in a young community that had just adopted a novel method of life and had as yet no settled understanding of the principles involved in it; or else he is replying to definite questions put to him by his converts. In all this the epistle is still a genuine letter, and not a treatise. It only rises from time to time above the level of a letter, through the extraordinary penetration, force, enthusiasm and elevation of feeling that the apostle throws into his treatment of more or less ordinary topics. He can never rest until he has carried up the question of the moment to some higher ground of faith or conduct. It is in this incisive and digressive way that we get the description of the Gospel in i. 18-ii. 16; of the Christian ministry in chs. iii., iv.; of the principle of consideration for others in ch. ix.; of the Sacrament of the Lord’s Supper in chs. x., xi.; of Christian love in ch. xii.; of the Resurrection and its consequences in ch. xv.

2 Corinthians is even more a product of the situation: it is even more taken up with personal relations. No epistle sheds more light on the later Church—so moral, so tender, so tender and affectionate, and yet so statesmanlike and so commanding. If doctrinal utterances occur from time to time, they are in every case incidental and unpremeditated.

The development of doctrine in St Paul’s epistles is due in part to the gradual subsiding of the eschatological temper, but even more to the growth of controversy. A crisis had arisen in Galatia owing to the invasion of the churches, which St Paul had founded there, by reactionary Jews. This called forth a letter1 from St Paul, who felt himself compelled to grapple at close quarters with teaching which he saw curiously reshaping the very root of his gospel; thus led both to write to his converts for the sake of others his whole conception of soteriology—his answer to the question how was man to be set right before God. That was a large part, and at the moment the most crucial part, of the whole problem of religion.

Two or three years later (c. A.D. 55-56) St Paul was bent on paying a visit to Rome. He was not going there straight, but to Jerusalem first. He knew that he could only do this at the

1 The date of this epistle is rather uncertain. Something depends upon the vexed question as to the identity of the Galatian churches. The epistle may be looked for conjunctively as early in the stay at Ephesus (c. A.D. 52-53). It is to be noted that the chronological grouping of the epistles by minute comparison of style is apt to be deceptive; resemblances of this kind are due more to similarity of subject than to proximity in date.

The imminent peril of his life. It seemed very doubtful whether he would accomplish his desire. And therefore he took the opportunity to send to the Romans what is really a summing up, not of the whole of Christianity, but of that side of Christianity which the preceding controversy had brought into special relief. He states his case as part of a larger question still—a question that inevitably became pressing at that particular time—as to the differences between the religious views and practices of the Jews and the local Church. These years of shock and conflict could not fail to have marked effect upon the shaping of definite Christian doctrine. They drew attention away from the future to the present, and to the past as leading up to the present. They compelled a man like St Paul to theorize: thought was driven inward; it was made to search for foundations, to organize itself and knit together part with part. And the impulse thus given continued. It showed itself strongly in the epistles of the next group, especially Ephesians and Colossians. These epistles took their form at once from a natural progression of thought and from a new phase of controversy, a sort of Gnosticizing theory, or theories, which perverted Christian practice and impaired the supremacy of Christ by placing other beings or entities by His side. The apostle meets this by renewed emphasis on the central position of Christ; and he at the same time carries a step farther his conception of the unity of the Church, as embracing both Jew and Gentile. The predominance of this somewhat recondite teaching gave to these epistles even more the character of treatises, which in the case of Ephesians is further enhanced by the situation: it is not merely a letter to a single church but to a group of churches. Philemon is of course a pure letter, and Philippians mainly so, the Pastoral, as their name implies, contain advice and instructions to the apostle’s lieutenants, Timothy and Titus, in the temporary charge committed to them of churches that the apostle could not visit himself.

The Epistle to the Hebrews is an epitaphic treatise of uncertain date, on the Pauline model, and by a disciple of St Paul or at least a writer strongly influenced by him, though influenced also in no small degree by the Jewish school of Alexandria represented by Philo. Of the many theories as to the address, the most plausible are perhaps those which would apply to a single congregation of Hebrew Christians in Rome, or to a local church or group of local churches in Palestine, perhaps like that of which the centre would be at Caesarea. It is not probable that the epistle was addressed to the mother church at Jerusalem.

The above sketch of the growth and general character of the Pauline Epistles is based upon the hypothesis that all thirteen are genuine. But some discrimination should be made in detail. The scepticism which challenges the whole collection may be best illustrated by the example of the Pastoral, which contains some of the most remarkable and attractive passages in the New Testament. The present writer would accept without any real hesitation the first of these classes; and the second he would also himself accept, though in regard to this class he would think it right to speak with rather more reserve. This may be said to be the position generally taken up by the leading English scholars; it differs slightly in a conservative direction, but not widely, from that of Harnack, a little more from that of Jülicher, and again a little more from that of Schanz.

2 Thessalonians is still questioned by scholars of some note; but when Jülicher can say that no question could be raised if it were not for the “dangerous and rank assumption of identity” that is being practised in giving up the whole case, because the objections drawn from 1 Thessalonians are, at least to the present writer, only an example of faulty criticism. Still less is there any valid argument against Philemon. It is a mark of the improved methods now current in Germany that, whereas in 1886 this epistle was rejected by a scholar as able and sober as Weissäcker, Jülicher now pronounces it “among the most assured possessions of the apostle.” (Einen. 6th ed. ii. 219.)

But there is an arguable case of some real weight against Colossians, Ephesians, Pastoral—least against Colossians and perhaps not against the Pastoral. Colossians is strongly vouched for by its connection with Philemon. And the objections to Ephesians are considerably reduced when it is taken as a circular letter. But it should be admitted that, especially in regard to Ephesians and Pastoral, it is not possible to connect this letter or this discourse with a characteristic subject matter, from the standard epistles. If these
later epistles are really the work of St Paul, the difference must be accounted for (a) by a somewhat unusual range of variation in style and thought on his part, and (b) by different environment and different circumstances. The question of whether these explanations are adequate. The writer of this is inclined to think that they are. St Paul was in any case an unusual writer, by no means facile or without prolonged or even tortuous arguments. All this is explained by any of the questions which have been put to him, and new situations called up new words and new minor ideas. He was also a writer in whom the physical wear and tear must have been enormous. It might well be believed that the change in the so-called Epistles of the imprisonment from the earlier epistles was due in part to the physical effects of prolonged confinement, as compared with the free, varied and open life and exciting experience of the earlier years. There is also another element that may possibly be due to the use of different amanuenses. An argument in favour of the genuineness of the epistles may be derived from the fact that each of the doubtful epistles is connected with others that are not doubtful by subtle links both of style and thought. If the reasons suggested above are not adequate, then we must set down the questioned epistles to some disciple of St Paul, who has carried the ideas and principles of his master a step farther or has applied them to a different set of problems and conditions.

2. The Gospels and Acts.—The Gospels and Acts arose in a way very similar to the Pauline Epistles. Here too there was no deliberate writer sitting in a specious looks that should be taken as sacred and authoritative. Here too the expectation of the near return of Christ doubtless delayed for a number of years the desire and need for written compositions. Here too the first steps were taken as the exigencies of the moment dictated. We are again driven to fill up the gaps in our knowledge by conjectures; but some such outline as the following has much to commend it.

When the enterprise of Christian missionaries had gone on for some little time, especially in the regions outside Palestine where there was little or no previous knowledge of Christ and of Christian ideals, the wandering prophets and apostles by whose missions were largely conducted must have soon begun to feel the need for some sort of written manual to supplement their own personal teaching. It was one of the characteristics of the early Christian teachers that they rarely stayed for any length of time in a place; they moved on, and the little congregation was left to wait for another visitor, who might be some time in coming. How was this interval to be filled? There would be every degree of preparation, or want of preparation, for the reception of Christian teaching. Some Jews, like those who are described in the Gospel of St John as “waiting for the kingdom of God,” would be pious men and women carefully trained in the Old Testament, who would be almost fit for the kingdom even before they had heard of Christ. Other Gentile converts would require instruction in the very rudiments of ethical and monotheistic religion. Between these extremes there would be many shades and degrees of ignorance and knowledge. How could these various cases be met at once most simply and most effectually? We remember that the Christian preachers were preaching before all things a Person, but a Person whose interest for these new converts lay chiefly in the fact that He was about to come and establish a supernatural kingdom for which they had to fit themselves. The best way therefore of helping them to do this was to provide them with an outline of the characteristic teaching of Christ, which should be at the same time a clear statement of His moral demands. It is probable that these requirements suggested the form of the first Christian Gospel, which the writer believes to be rightly identified with the so-called Logia of St Matthew, now often designated by the symbol Q. It did not aim at being a history, and still less a complete history, but it was mainly a collection of sayings, which were in this form that have come down to us as the so-called “Two-Ways,” is commonly thought to have been in the first instance a Jewish manual put into the hands of proselytes. On our hypothesis the Logia would have been a sort of Christian manual used with a similar object. (v.) We are confirmed in this opinion by the fact that the epistles of St Paul furnish many indications that Christians in general, including those who had not been much in contact with the original Twelve, were well acquainted with the leading features in the character of Christ and in the Christian ideal, although there is little corresponding evidence for their knowledge of details in the life of Christ.

There is a similar statement to the one mentioned above, that like it must have been originally made before the end of the first century, as to a Gospel composed by St Mark on the basis mainly of the preaching of St Peter, though this need not exclude personal experience (as, e.g., perhaps in Mark xiv. 51-52) or information derived from other sources. Only raw materials came from St Peter, and those probably not checked or revised by him; the arrangement is due to Mark himself, and is more successful than might have been expected in the circumstances. The name of the author is added to the Gospel at the end of the second century.

According to Irenaeus (c. A.D. 185), who is more precise than Clement of Alexandria, the Gospel was not published until after the death of Peter, which would place its composition between the limits A.D. 65 and 70. The phenomena which are sometimes supposed to require the hypothesis of an Ur-Marcus are more simply and satisfactorily explained as incidents in the transmission of the Marcan text.

The matter peculiar to Matthew and Luke raises a number of interesting questions which are still too much sub judice to
be answered decidedly or dogmatically, though approximate and provisional answers may before long be forthcoming. All parts of the problem have been greatly forwarded by the recent publication of important works by Wellhausen and Harnack (see below). The date of the completed Luke depends (a) on whether or not we believe Luke himself or a later disciple to be the author, and (b) whether or not we believe that the author of Acts had seen Josephus' Antiquities, published in A.D. 93 or 94. Professor Burkitt takes an original line in maintaining that Luke was the author of both works, and yet that he had seen Antiq. The present writer is inclined to think the latter hypothesis not proven. The date of Matthew cannot be fixed more nearly than 70-100.

3. The Catholic Epistles.—The Catholic Epistles were so called in the first instance from their wider and more indefinite address; they were intended for Christians generally, far over some wide area, rather than for a particular church or individual. 2 and 3 John are exceptions, but probably came in under the wing of the larger epistle, which is strictly "catholic." As applied to a class of epistles, the title dates from Eusebius, early in the 4th century; the epistle is given to single epistles by Origen, and is found as far back as the end of the 2nd century. In later Latin usage "catholic" came to mean much the same as "canonical," another name that was also given.

This group of epistles practically concludes and supplements the work of the epistles of St. Paul. The epistles, if genuine, must be placed late in the lifetime of the brother of the Lord. In that case it was probably not written with any direct polemic against writings of St. Paul, but against heresy versions of his teaching that had reached Jerusalem. Controversy of this kind is not always conducted with complete understanding of that which is being opposed. The Epistle of Jude cannot be either dated or localized with any certainty. It seems on the whole most probable that 2 Peter is not a genuine work, but that it came from the same factory of pseudonymous Petrine writings as the Apocalypse which bears the same name, though the one has, and the other has not, obtained a place within the Canon. This epistle was questioned from the first, and only gained its place with much hesitation, and rather through slowness of opposition than any conclusiveness of proof. This epistle is two or more canons that are more completely treated under the next head.

Even in the case of the two more important epistles, 1 Peter and James, we have to add the qualification "if genuine," but rather perhaps because of the persistence with which they are challenged than because of inherent defect of attestation. The evidence for 1 Peter is both early in date and wide in range, and the book was one of those that passed as "acknowledged" in antiquity. The evidence for James is not so widely diffused but is found in early writings. Perhaps the position of these two epistles might be described as one of mediocrity or obscurity. For that of 2 Peter, of Inconsistency, casting doubt upon them, we should prefer to say that they are both probably genuine, but that there are features that are not as yet fully explained.

The chief of these features is their relation to the writings of St. Paul. There is indeed so much that is Pauline in 1 Peter as to give distinct attractiveness to the hypothesis, which is most elaborately maintained by Zahn, that a larger share than usual in the composition of the letter was left to Silvanus (1 Peter v. 12). Nor does it appear to us that the objections to this theory brought by Dr. Chase in his excellent article on the epistle in Hastings' Dictionary are really so fatal as he supposes. The epistle is more the work of a companion of St. Paul of long standing than of one who, with quite different and independent antecedents, had only been influenced by the perusal of one or two of St. Paul's letters. In the Epistle of James we have a really distinct type; and it seems to us that the degree to which the epistle misses its mark as a letter may be easily and naturally accounted for in more ways than one.

4. The Johannine Writings.—The Gospel and Epistles that bear the name of John, and the Apocalypse, form a group of writings that stand very much by themselves and are still the subject of active discussion. The points in regard to them that would unite the greatest number of sufferers would seem to be these:—(1) That, except 2 Peter, they are probably the latest of the New Testament writings, and that they form a group closely connected among themselves, though it is not clear how many hands have been at work in them. (ii.) That they arose not far from each other towards the end of the 1st century. The Apocalypse is plausibly dated by Reinach and Harnack near to the precise year 93, and the other writings may be referred to the reign of Domitian (81-96), though many critics would extend the limit to some two decades later. (iii.) The writings are to be connected, either more or less closely, with John of Ephesus, who was a prominent figure towards the end of the 1st century. On the other hand, the greatest differences would be:—(i.) As to the personal identity of this John—is he himself "the beloved disciple"? Is he the apostle, the son of Zebedee or another? Can the writer of the Apocalypse be the same as the writer of the Gospel and Epistles? (ii.) What is the exact relation of John of Ephesus to the Gospel? Is he its author or only the authority behind it? (iii.) How far is the tradition of the Apocalypse, and how far is it, in the strict sense historical? This last question is beginning to overshadow all the rest.

Whatever may be the ultimate decision on these intricate questions, the Fourth Gospel in any case played a very important part in the history of the Church and of Christian theology. It drew together and gathered up into itself the forces at work in the apostolic age; and, by reaching out a hand as it were (through the preface) towards Greek philosophy, it succeeded in so formulating the leading doctrines of Christianity as to make it more acceptable than it had as yet been to the Gentile world, and in securing for the Gospel a place in the mainstream of European thought. It is probably true to say that no other primitive Christian writing has had so marked an effect on all later attempts to systematize the Christian creed.

The situation as to the Fourth Gospel has been altered in recent years by the statement attributed to Papias that the two sons of Zebedee (and not only one) were slain by the Jews—a statement which has been more than once made the basis of the evidence for 4 John (full details in Burkitt, Gosp. Hist. pp. 252-255; E. Schwartz, Uber d. Tod d. Söhne Zebede, Berlin, 1904). But this statement does not affect the historical character of John of Ephesus, who is also expressly described by Papias as "a disciple of the Lord" (Eus. H.E. iii. 39. 4). On the other hand, the evidence that the Gospel is a thorough-going allegory must be hard to maintain in view of the frequent appeals to "witness" which is several times defined as eye-witness (John i. 15, 32, iii. 11, xix. 35, xxx. 24; 1 John i. 1–3; cf. John v. 36, x. 25). This is borne out by Ignatius with his strong emphasis on the reality of the Gospel history (Eph. xx. 2; Trog. x.; Smyrn. i. 1, 2, iii. 11-13, v. 2). If the writer of the Gospel were simply inventing his facts, they would be no proof of his thesis (John xx. 31). It is a paradox that he should be invoked in the reality of his message, yet that it should be contended at the same time that for him "ideas, and not events, were the true realities."
eccentric, but the writers must have been persons of some note. Outside this group would come what are called the Apocryphal Gospels and Acts (Gospel according to Hebrews, according to Egyptians, of Peter, of Truth, of the Twelve [or Elibonite Gospel], the recently recovered so-called Logie; the Gospel of Nicodemus, the Protevangelium of James, the Gospel of Thomas, the Acts of Pilate, Acts of Paul, Peter, John, Andrew, Thomas; the Preaching of Peter, the Apocalypse of Peter). As the 2nd century wears on, we come to controversial or philosophical works: Agrippa, Castor, Quadratus, Aristides. With the middle of the century we reach a considerable writer in Justin Martyr. With him the twilight period which succeeds to the apostolic age is over, and we enter upon the main course of ecclesiastical history. At this point, therefore, our survey may end.

2. The Process of Discrimination and Collection. 1. Discrimination.—Throughout the apostolic age Christians were conscious of being carried forward in a great movement, the origin and motive-power of which they regarded as supernatural. It began on the Day of Pentecost, but continued in full tide almost to the end of the 1st century, and, even when it began to subside, it did so quite gradually. The moment of transition is clearly marked in the Didache, where the charismatique ministry of “apostles and prophets” is beginning to give place to permanent local officials of the Church, bishops, presbyters and deacons. The literature that we now call the New Testament held its place because it was regarded as a product of the palmy days of that great movement. It was considered to be the work of inspired men, of men whom the Holy Spirit, at that time specially active in the Church, had chosen as its organ. We have seen how St Paul, for instance, fully believed that his own preaching had a force behind it which vindicated for it the claim to be “the word of God” (1 Thess. ii. 13); and it was inevitable that the other preachers and teachers should have had in different degrees something of the same consciousness. This consciousness receives perhaps its strongest expression in the Apocalypse.

There is really no contradiction between this sense of a high calling and mission, with a special endowment corresponding to it, and the other fact that the writings from this age that have come down to us are all (except perhaps the Apocalypse, and even the Apocalypse, in some degree, as we see by the letters to the Seven Churches) strictly occasional and natural in their origin. The lives and actions of apostles and prophets were in their general tenor like those of other men; it was only that, for the particular purpose of their mission, they found themselves carried beyond and above themselves. St Paul himself knew when he was speaking by the Spirit, and when he was not; and we too can recognize to some extent when the afflatus comes upon him. It is fortunate that this should be so clearly marked in his epistles, because it enables us to argue by analogy to the other writings. And it comes to historical books like the third Gospel and the Acts, we find the writer just pursuing the ordinary methods of history, and not claiming to do anything more (Luke i. 1-4). With the methods of history, these writers were naturally exposed to the risks and chances of error attendant upon those methods. There was not at first among the writers any idea that they were composing an infallible narrative. The freedom with which they used each other's work, and with which the early texts were transmitted, excludes this. But there was the idea that the whole movement of the Church to which they gave expression was in a special sense divine. And this belief was the fundamental principle that determined the marking off of the writings of the first, or apostolic, age from the rest.

At the same time it must not be supposed that a hard and fast line can be drawn between which the spiritual stimulus of this first age ceased. The writings of Clement of Rome (A.D. 97) and of Ignatius (c. A.D. 110) mark the transition. Ignatius, for instance, clearly distinguishes between his own position and that of the apostles: “I do not enjoin you, as Peter and Paul did. They, being apostles, I was a convict; they were free, but I am a slave to this very hour.” (Rom. iv. 3). And yet, none the less, Ignatius is conscious of acting and speaking at times from a kind of inspiration. “Even though certain persons desired to deceive me after the flesh, yet the spirit is not deceived, being from God; for it knoweth whence it cometh and where it goeth, and it searcheth out the hidden things. I cried out, when I was among you; I spake with a loud voice, with God’s own voice, give ye heed to the bishops, and the presbyters and deacons” (Philadelph. vii. 1). In like manner Clement, in two places (lix. 1, lixii. 2), writes as though God were speaking through him.

In the Egyptians: Considering with the tendency to discriminate between the higher authority of certain writings and the lower authority of others, there was also a tendency to collect and group together writings of the first class. The earliest example of this tendency is in the case of the Pauline Epistles. Marcellus, we know (c. A.D. 149), had a collection of ten out of thirteen, in the order, Gal. 1 and 2 Cor., Rom., 1 and 2 Thess., Laodic. (= Eph.), Col., Phil., Philem. We observe that the Pastoral is omitted. But it is highly probable that the collection went back a full generation before Marcellus. The short Epistle of Polycarp contains references or allusions to no less than nine out of the thirteen epistles, including 2 Thess., Eph., 1 and 2 Tim. Ignatius, writing just before, gives clear indications of six, including 1 Tim. and Titus. The inference lies near at hand that both writers had access to the full collection of thirteen, not omitting the Pastors. Polycarp (ad Phil., xii. 2) shows how strong was the interest in collecting the writings of eminent men.

It of course did not follow that, because the letters of St Paul were collected, they were therefore regarded as sacred. The feeling towards them at first would be simply an instinct of respect and deference; but we have seen above that the essential conditions of the higher estimate were present all along, and were only waiting to be recognized as soon as reflective thought was turned upon them. This process appears to have been going on throughout the middle years of the 2nd century.

The famous passage of Irenaeus (Adv. Haer. iii. 15. 8) assumes the possession by the Church of four authoritative Gospels and no more. This is the general view of the Church of his time, except the little clique known as the Alogi who rejected the Fourth Gospel, and Marcion who only recognized St Luke. But here again, we may go back some way farther. Irenaeus writes (c. A.D. 185) as though the Four Gospels had held the field as far back as he can remember. About A.D. 170 Tatian, the disciple of Justin, composed out of these Gospels his Diatessaron. If Justin used any other Gospel, his use of it was very subordinate. Practically we may say that the estimate of the Four to which Tatian and Irenaeus testify must have been well established by the middle of the century, though sporadic instances may be found of the use of other Gospels that did not become canonical. The sifting out of these was proceeding steadily and gradually, and by the end of the century it may be regarded as complete.

We must make allowance for the existence of this margin, and for the blurring of the boundary-line that goes along with it. We cannot claim for the Church absolute sureness of judgment as to what falls on one side of the line and what on the other. It is possible, e.g., that a mistake has been made in the case of 2 Peter, which, however, is edifying enough. It is not least possible that writings like 1 Clem. and Epp. Ignat. are not inferior in real religious value to the Epistle of Jude. But, broadly speaking, the judgment of the early Church has been endorsed by that of after ages.

Harnack raises an interesting question (Reden u. Aufsätze, ii. 271) as to how it came about that the four Gospels became not only one. There are many indications early in the 2nd century of a tendency towards the recognition of a single Gospel; for instance, there are the local Gospels according to Hebrews, according to Egyptians; Marcion had but one Gospel, St Luke, the Valentinians preferred St John and so on; Tatian reduced the Four Gospels to one by means of a Harmony, and it is possible that somehow or other the kind may have existed before he did this. There is probably some truth in the view that the Church clung to its Four Gospels as a weapon against Gnosticism; it could not afford to reduce the number of its documents. But, over and above this, there was probably something in the circumstances in which the
canonical Gospels were composed, and in their early history, which gave them a special prestige in the eyes of the faithful. The story which Eusebius quotes from Clement of Alexandria (H.E. vi. 14) seems to point to something of the kind.

3. Influences at work.—The whole process of the formation of the New Testament was steady and gradual. The critical process of equating or condensing grew up with the New Covenant with its sacred book by the side of the Old. Eusebius, in his written embodiment we call the Old Testament, extends roughly over the 2nd century. By the last decades of that century a preliminary list of these new Sacred Books had been formed and placed by the side of the Old with substantially the same attributes. We must briefly sketch the process by which this came about, tracing the causes which led to the result and indicating the manner in which they operated.

We have seen that the ultimate cause was the consciousness on the part of the Church that the first age of its own history was characterized by spiritual workings more intense than other times. This feeling had been instinctive, and it found expression in several ways, each one of them partial, when taken alone, but obtaining their full effect in combination. It should be understood that the goal towards which events were moving all the time was the equalizing of the New Testament with the Old Testament.

(a) Public Reading.—From the first the way in which the Epistles of Peter were known to the members of the church in such a way that they were addressed was by reading in the public assemblies for worship. This was done by the direction of the apostle himself (1 Thess. v. 27; Col. iv. 16). At first any writing that was felt to be authoritative was read, even if it was not written in the way, especially in the local associations (cf. Dionysius of Corinth, ep. Eusebius, H.E. iv. 23. 11). But, as worship became more thoroughly organized, it was invested with increasing solemnity; the freedom of choice was gradually restricted; and inasmuch as sections were regularly taken from the Old Testament, it was only natural that other sections read alongside of them should gradually be placed upon the same footing.

(b) Authority of Christ and the Apostles.—As the words of prophets and lawgivers had from the first carried their own authority with them under the Old Covenant, so from the first the words of Christ needed no commendation from without under the New. And what was applied to words of Christ soon came also to apply in their degree to words of the apostles. The only difference was that an authority at first instinctively assumed came to be consciously recognized and formally defined. There was also a natural tendency towards levelling up the different parts of books and groups of books. In other words, the somewhat vague sense of spiritual power and importance possessed hitherto by the New Testament was expanded into the conception of sacred books united in a sacred volume.

(c) Controversy.—The process was accelerated by the demand for a standard or rule of faith and practice. At an early date in the 2nd century the criterion of the Christian Church was that which set the form of what we call the Apostles' Creed. But the Creed was but the condensed essence of the New Testament scriptures, and behind it there lay an appeal to these scriptures, which was especially necessary to the case of the Marcionites and Montanists. The latter sects, which disowned the sacred books professed to accept the common belief of Christians. In its conflict with Gnostics, Marcionites and Montanists the Church was led to insist more and more upon its Bible, its own Bible, just as in its older controversy with the Jews it had to insist on the Bible which it inherited from them. This was a yet further cause of the equating of the two parts of the sacred volume, which went on with an imperceptible crescendo through the first three quarters of the 2nd century, and by the last quarter was fairly complete.

(d) Provisional Canon of New Testament (end of 2nd century).—By the last quarter of the 2nd century the conception of a Christian Bible in two parts, Old Testament and New Testament, may be said to be definitely established. Already at the beginning of this period Melito had drawn up a list of the twenty-two Books of the Old Covenant, i.e. of the documents to which the Old Covenant made its appeal. It was a very short step to the compiling of a similar list for the New Testament. The very short step becomes the New Testament, by the side of the Old Testament. It is therefore not surprising, though a piece of great good fortune, that there should be still extant a list of the New Testament books that may be roughly dated from the end of the century. This list published by Muratori in 1740, and called after him "the Muratorian Fragment on the Canon," is commonly believed to be of Roman origin and to be a translation from the Greek, though there are a few dissentients on both heads. The list recognized four Gospels, Acts, thirteen epistles of Paul, two epistles of John, Jude, Apocalypse of John and as the text stands of Peter; there is no mention of Hebrews or (apparently) of 3 John or Epistles of Peter, where it is possible—we cannot say more—that the writer of Peter is accidental; the Shepherd of Hermas on account of its date is admitted to private, but not public, reading; various writings associated with Marcion, Valentinus, Basilides and Montanus are condemned.

There are many interesting points about this list, which still shows considerable freshness of judgment. (i) There are traces of earlier controversy in the list about the conception of the Gospels as compared with St John, and in criticism of the latter as differing from the former. (ii) There is a healthy tendency to lay stress on the historical value of narratives which proceed from eye-witnesses. (iii) An over-ruling and uniting influence is ascribed to the Spirit. (iv) The writer is concerned to point out that letters addressed to a single church and even to an individual may yet have a wider use for the Church as a whole. (v) The sense is not yet lost that the appeal of the Old Testament is as coming from men of prophetic gifts, and that of the New Testament as coming from apostles. (vi) It is in accordance with this that a time limit is placed upon the books included in the New Testament. (vii) Christians are to base their guard against writings put forth in the interest of heretical sects.

When the data of Fragm. Murator. are compared with those supplied by the writers of the last quarter of the 2nd and first of the 3rd centuries (Tatian, Theoph. Ant., Iren., Clem. Alex., Tert., Hippol.), it is seen that there is a fixed nucleus of writings recognized, with one exception, over all parts of the Christian world. The church of Edessa and Mesopotamia. This Church at first acknowledged only the Gospel in the form of Tatian's Diatessaron, Acts and the Epistles of Paul. These seem to have been the only books translated immediately upon the foundation of the Edessian Church, though an edition of the separate Gospels must have followed either before or very soon afterwards. In all other churches the four Gospels, Acts and Epistles of Paul are fixed, with the addition in nearly all of 1 Peter, 1 John. The Apocalypse was generally accepted in the West. Hebrews and James were largely accepted in the East.

In the 3rd century the conspicuous figure is Origen (ob. 253), whose principal service was, through the vast range of his knowledge, his travels and his respect for tradition wherever he found it, to keep open the wider limits of the Canon. There is not one of our present books that he does not show himself inclined to accept, though he notes the doubts in regard to 2 Peter and 2 and 3 John. Later in the century Dionysius of Alexandria applies some acute criticism to justify the Alexandrian dislike of the Apocalypse.

(5) The Final Canon (4th century).—Early in the 4th century Eusebius, as a historian reviews the situation (H.E. iii. 25. 1). He makes three classes; the first, including the Gospels, Acts, Epistles of Paul, 1 Peter, 1 John, is acknowledged; to these, if one likes, one may add the Apocalypse. The second class, which is questioned, but accepted by the majority; viz. James, Jude, 2 Peter, 2 and 3 John. The third class, of works to be decidedly rejected, contains the Acts of Paul, Hermas, Apocalypse of Peter, Barnabas, Didaché; to these some would add Apoc. of John, and others Ev. sec. Hebr. About the same time another line of tradition is represented by Lucian and the school of Antioch. The vernacular Church of Syria represented yet a third. In Egypt the uncertainty and laxity of usage was still greater. This state of things the great Athanasius set himself to correct, and he did so by laying down a list identical with the Second New Testament as we have it now. It was very largely the influence of Athanasius that finally turned the scale. He was peculiarly qualified for exercising this influence, as his long exile in the West made him familiar with Western usage, while he was also able to bring to the West the usage that he was trying to establish in the East. His efforts would be helped by Westerns, like Hilary and Lucifer, who were exiled to the East. The triumph of the Athanasian Canon, indeed, went along with the triumph of Nicene Christianity. And while the movement
received its impulse from Athanasius, the power by which it was carried through and established was largely of that of his party ally, the Church of Rome.

The final victory was no doubt a little delayed. Asia Minor and Syria were for most of the 4th century divided between the following of Eusebius (Cyril of Jerusalem in A.D. 348, Gregory of Nazianzus, the list of *Apost. Can. 85*, that attached to Can. 59 of the Council of Laodicea, c. A.D. 363) and the whole school omitting Apoc. Amphilebou (of Iconium c. 380) speak the two words, Eusebius and Anthone, as synonyms. The Eusebian list only wanted the complete admission of the Apocalypse with the Athanasian; and Athanasius had one stalwart supporter in Epiphanius (ob. 403).

The original Syriac list, as we have seen, had neither Epp. Cath. nor Apoc. The Peshito version, in regard to which Professor Burkitt's view is now pretty generally accepted, that it was the work of Rabban, bishop of Edessa, 411-433, added the 3 Epp. Cath. The remaining 4 Epp. Cath. and Apoc. were supplied in the monastic version of 408, and retained in the Harklean revision of 616. But both these were Monophysite and of limited use, and the Nestorians still went on using the Peshito.

Meantime, in the West, an important Synod was held by Damascus at Rome in 382 which, under the dominant influence of Jerome and the Athanasian tradition, drew up a list corresponding to the present Canon. This was ratified by Pope Gelasius (492-496), and independently confirmed for the province of Africa by a series of Synods held at Hippo Regius in 393, and at Carthage in 397 and 419, under the lead of Augustine. The former completion of the Ecumenic process in East and West was reserved for the Quinisextine Council (Council in Trullo) of 692. But even after that date irregularities occur from time to time, especially in the East.

In the fixing of the Canon, as in the fixing of doctrine, the decisive influence proceeded from the bishops and the theologians of the period 325-450. But behind these was the practice of the greater churches; and behind that again was not only the lead of a few distinguished individuals, but the instinctive judgment of the main body of the faithful. It was really this instinct that told in the end more than any process of quasi-scientific criticism. And it was well that it should be so, because the methods of criticism are apt to be, and certainly would have been when the Canon was formed, both faulty and inadequate, whereas instinct brings into play the religious sense as a whole; with spirit speaking to spirit rests the last word. Even this is not infallible; and it cannot be claimed that the Canon of the Christian Sacred Books is infallible. But experience has shown that the mistakes, so far as there have been mistakes, are unimportant; and in practice even these are rectified by the natural gravitation of the mind of man to that which it finds most nourishing and most elevating.

**BIBLIOGRAPHY.**—The separate articles on the various books of the New Testament may be consulted for detailed bibliographies. The object of the above sketch has been to embrace in constructive outline the ground usually covered analytically and on a far larger scale by the introductions to the New Testament, and by Histories of the New Testament Canon. In English there is a standard work of the latter class in Westcott's *General Survey of the History of the Canon of the New Testament* (first published in 1855, Import of revision and additions in 4th ed. 1924, 7th ed. 1896), with valuable appendix of documents at the end. There was also a useful collection of texts by Prof. Chartris of Edinburgh, *Canonicity* (1880), based on Klicher, *Quellenwunderung* (1844), but with improvements. The leading documents are to be had in the hand and reliable *Kleine Texte* (ed. Litzmann, from 1902). On Introduction the ablest English works are Salmon, *Historical Introduction to the Study of N.T.* (1st ed. 1885, 5th ed. 1931); but, although still possessing value as argument, this has been more distinctly left behind by the progress of recent years. England has made many weighty contributions both to Introduction and Canon, especially Lightfoot, *Essays on Supernatural Religion* (collected in 1890); editions of Books of the New Testament and Apostolic Fathers; Westcott, editions; Hopt, especially *Romans and Ephesians* (posthumous, 1895); Swete, editions; Knowling and others. The Oxford Society of Historical Theology put out a useful *New Testament in the Apostolic Fathers* in 1905, and Prof. Stanton of Cambridge, *The Gospels as Historical Documents* (part i. in 1903). Prof. Burkitt's *Gospel History and its Transmission* appeared in 1906. For the introduction the reader might consult *The Dictionary of the Bible* (ed. Hastings, 5 vols., 1898-1906, and *Encyclopedia Biblica* (ed. Cheyne and Black, 4 vols., 1899-1903).

Dr Hastings and his contributors belong more to the right wing of criticism, Dr Orsmond less. To the left, the systematic production of German and has done excellent service in its day, though there are signs that the analytic method is better, mainly practised is beginning to give place to something more synthetic or constructive. The pioneer work in this latter direction is Weizäcker's skilful and artistic *Apostolische Zeitalter* (1st ed. 1886, 3rd ed. 1901; Eng. trans. 1894-1905); somewhat similar on a smaller scale is von Soden, *History of Early Christian Literature* (trans., 1906). Special mention should be made of Wellhausen on the Synoptic Gospels (1893-1905), and Harnack, *Beitrdage z. Einleitung in d. N.T.* (part 1. 1906, part ii. 1907). The present discussion is not recent enough to introduce the *Dicta* of recent support. The work of H. J. Holtzmann (1st ed. 1885, 3rd ed. 1902); B. Weiss (1st ed. 1886, 3rd ed. 1897); a series of works by Th. Zahn, especially his *Deutsche Bibelberichte* (1897), *History of the New Testament* (1899), *Gesch. d. neut. Kanons* (3 vols., 1888-1892, third ed. 1904); *Gesch. d. Gesch. d. neut. Kan.* (7 parts, 1881-1907), *Einführung (2 vols., 1897-1899), Grundriss d. Gesch. d. neut. Kan.* (1st ed. 1901, 2nd ed. 1904); A. Dibelius, *Einführung in die Geschichte des Neuen Testaments* (4th ed. 1906; Eng. trans. by Miss Janet Ward, 1904).

Zahn and Jähner may be said to supplement and correct each other, as they write from very different points of view, and on Jähner's side there is no lack of criticism of his great opponent. Zahn's series is monumental in its way, and his *Grundriss* is very handy and full of closely packed and (in statements of facts) trustworthy matter. Jähner's work is also the highly practical, very complete and well proportioned in scale, and up to a certain point, a matter is also excellent. The *History of the Canon*, by the Egyptologist Joh. Leipoldt (Leipzig, 1907), may also be warmly recommended; it is clear and methodical, and does not make the minimum mistake of doing too much of the secondary causes; the author does not forget that he is dealing with a sacred book, and that he has to show why it was held sacred. (W. Sa.)

2. Texts and Versions.

The *apparatus criticus* of the New Testament consists, from one point of view, entirely of MSS.; but these MSS. may be divided into three groups: (A) Greek MSS., which in practice are known as *Septuaginta*; (B) MSS. of versions in other languages representing translations from the Greek; (C) MSS. of other writings whether in Greek or other languages which contain quotations from the New Testament.

(A) Greek MSS.—These may be divided into classes according to style of writing, material, or contents. The first method distinguishes between uncial or majuscule, and cursive or minuscule; the second between papyrus, vellum or parchment, and paper (for further details see *Manuscript and Palaeography*); and the third distinguishes mainly between Gospels, Acts and Epistles (with or without the Apocalypse), New Testaments (the word in this context being somewhat, broadly interpreted), lectionaries and commentaries.

Quite accurate statistics on this subject are scarcely attainable. Von Soden's analysis of numbers, contents and date may be tabulated as follows, but it must be remembered that it reckons many small fragments as separate MSS., especially in the earlier centuries. It is also necessary to add that there is one small scrap of papyrus of the 3rd century containing a few verses of the 4th Gospel.
Fig. 1.—Codex Vaticanus. (From facsimile ed. by J. Cozza-Luzi, 1889–1890.)

Fig. 2.—Codex Sinaiticus. (From facsimile published by Palaeographical Soc., 1873.)

Fig. 3.—Codex Alexandrinus. (British Museum.)

Fig. 4.—From a probable Northumbrian Copy of the Codex Amiatinus. (British Museum.)

Fig. 5.—Pentateuch in Hebrew, 9th Century. (British Museum.)

Fig. 6.—Vulgate. (From MS. written for the monastery of Ste Marie de Parco, Louvain, A.D. 1148. British Museum.)
This table says nothing about style of writing or material, but it may be taken as a general rule that MSS. earlier than the 13th century are on vellum and later than the 14th century are on paper, and that MSS. earlier than the 9th century are uncial and later than the 10th are minuscule. There are said to be 129 uncial MSS. of the New Testament (Kenyon, Textual Criticism of the New Testament, p. 45), but it is not easy to be quite accurate on the point.

Besides the MSS. mentioned in the table above, there are 281 MSS. containing commentaries on the Gospels, 169 on Acts and Ephesians 66 on the Apocalypse, 1722 lectionaries of the Gospels and 287 of Acts and Epistles, making a grand total of 3698 MSS. It must be remembered that the dating of the MSS., especially of minuscules, is by no means certain: Greek Palaeography is a difficult subject, and not all the MSS. have been investigated by competent palaeographers.

The notation of this mass of MSS. is very complicated. There are at present two main systems: (1) Since the time of Wetstein it has been customary to employ capital letters, at first of the Latin and latterly also of the Greek and Hebrew alphabets, to designate the uncial, and Arabic figures to designate the minuscule. Of this system there are two chief representatives, Gregory and Scrivener. These agree in the main, but differ for the more recently discovered minuscules. Gregory's notation is more generally used, and Scrivener's, though still followed by a few English scholars, is likely to become obsolete. This method of notation has various disadvantages. There are not enough letters to cover the uncial, the same letter has to serve for various fragments which are quite unconnected except by the accident of simultaneous discovery, and no information is given about the MSS. referred to. (2) To remedy these drawbacks an entirely new system was introduced in 1902 by von Soden in his Die Schriften des neuen Testaments, Bd. I, Abt. I, pp. 33-46. He abandons the practice of making a distinction between uncial and minuscule, on the ground that for textual criticism the style of writing is less important than the date and contents of a MS. To indicate these he divided MSS. into three classes. (1) New Testaments (the Apocalypse being not regarded as a necessary part), (2) Gospels, and (3) Acts, Epistles and Apocalypse (the latter again being loosely regarded). These three classes he distinguished as δ, α and ɛ classes from the earliest period to the 9th century inclusive are numbered 1 to 49; those of the 10th century 50 to 99; for the later centuries numbers of three figures are used, and the choice is made so that the figure in the hundreds' place indicates the century, 1 meaning 11th century, 2 meaning 12th century, and so on; to all these numbers the appropriate letter, if it be δ or α, must be always prefixed, but if it is ɛ, only when there is any chance of ambiguity. In a δ MSS. a distinction is made for those of the 11th and subsequent centuries by reserving 1 to 49 in each hundred for MSS. containing the Apocalypse, 50 to 99 for those which omit it. Similarly, in a α MSS. a distinction is made according to their contents; the three-figure numbers are reserved for MSS. which contain Acts, Catholic Epistles and Pauline Epistles with or without the Apocalypse, the presence or absence of which is indicated as in the δ MSS.; but when a MS. consists of only one part a ' 1' is prefixed, thus making a four-figure number, and the precise part is indicated by the two last of the four figures; Acts and Catholic Epistles, 20-69 means Pauline Epistles and 70-99 means Apocalypse. In the case of ɛ MSS. 1-99 is used for the earliest MSS. up to the 9th century, and as this is insufficient, the available numbers are increased by prefixing a 0, and reckoning a second hundred from 01 to 099; 1000 to 1999 are MSS. of the 10th century; 200 to 199 are MSS. of the 12th century, 200-299 of the 13th, and so on; as this is insufficient, the range of numbers is increased by prefixing a 1, and so obtaining another hundred, e.g. 1100 to 1199, and in the 12th and subsequent centuries, where even this is not enough, by passing on to the thousands and using 2000-3999 for the 12th century, 3000-3999 for the 13th and so on. In each case ɛ is prefixed whenever there is any chance of ambiguity. It is claimed that this system gives the maximum of information about a MS., and that it leaves room for the addition of any number of MSS. which are likely to be discovered. At present it has not seriously threatened the hold of Gregory's notation on the critical world, but it will probably have to be adopted, at least to a large extent, when von Soden's text is published.

(For the full details of this subject can be found in E. Miller's edition of C. F. G. Compilations, Introduction to the Criticism of the New Testament (George Bell, 1894); C. R. Gregory's Prolegomena to Tischendorf's Novum Testamentum Graece, Ed. VIII. critica major (Leipzig, 1894); C. F. G. Compilations, Textkritik (Leipzig, 1900); H. von Soden's Die Schriften des neuen Testaments (Berlin, 1901).)
Græco-Coptic papyri, partly on the order of the Pauline epistles. At present, both in \( α \) and \( β \), Hebrews is placed after 2 Thess., but in \( β \) there is also a continuous enumeration of sections throughout the epistles, according to which there is an entirely different order (2 Sam. 1: 1; 3: 1; 10: 1; 11: 1; 14: 1). The 'shape' of the letter is preserved, with 70 instead of 59, and the omitted section numbers are found in Hebrews. Obviously, the archetype placed Hebrews between Galatians and Ephesians, but there is no reason to suspect that \( α \) is older or has been preserved with more accuracy than \( β \) or \( C \) in the region of 1 Tim., though without changing the section numbers. This older order of the epistles is only found elsewhere in the Sahidic version of the New Testament, and it was probably therefore the old Egyptian type. More than this, however, it is evident that in the letter of A.D. 357 (according to the Greek and Syriac texts, but not the Sahidic), that Athanasius then introduced the order of the epistles in \( α \), the latter being the only order in which it can be found in the 'Greek' History of Eusebius. For the view that the archetype of \( α \) came from Alexandria or the neighbourhood, and was older than the time of Athanasius, it is scarcely possible that \( α \) is itself Alexandria, for the order of epistles was not the earliest known or earliest preserved in the Coptic targum of 2 Tim. and 3 Tim., and \( α \) was the only one to be cut and may have been introduced elsewhere, perhaps in Cæsarea. A further argument, sometimes based upon and sometimes in turn used to support the foregoing, is that 1 Cor. 2: 10 represents that of Hesychius; but this is extremely doubtful (see the section Textual Criticism below).

The question of the provenance of \( α \) and \( β \) may be best studied in: J. Armitage Robinson, "Euthalitana," Texts and Studies, iii. 3 (Cambridge, 1893), esp. pp. 34-43 (these more especially for the connexion with Cæsarea); A. Rahls, "Alter und Heimat der von der Bischöfl. Wiss. zu Göttingen, (1899), vol. i. pp. 72-79; and O. von Gebhardt in a review of the last named in the Theologische Literaturzeitung (1899), cols. 556-563.

Codex Bezæ (Cambridge Univ. Nu. 2, 41). Greg. D, von Soden \( \text{§} 5 \); an uncial Græco-Latin MS. not later than the 6th century and probably considerably earlier. The text is written in one column, the left hand page of the leaf being reserved for the evangelists and the Latin on the right. It was given to the University of Cambridge in 1851, but its early history is doubtful. Bezæ stated that it came from Lyons and had been always preserved in the monastery of St. Paul there. There is no reason to question Bezæ's bona fides, or that the MS. was obtained by him after the sack of Lyons in 1562 by des Adrets, but there is room for doubt as to the accuracy of this statement. Greg. D, and the parchment MS. are for a long time called Codex. His information on this point would necessarily be derived from Protestant sources, which would not be of the highest value, and there are two pieces of evidence which show that just previously the MS. was in Italy. In the first place it is certainly identical with the MS. called \( w \) which is quoted in the margin of the 1550 edition of Robert Stephanus' Greek Testament; this MS., according to Stephanus' preface was collated for him by friends in Italy. In the second place it was probably used as a concordance of Trent in 1544 by G. G. de Prato, bishop of Clermont in Auvergne, and in the last edition of the Annotationes Bezæ quotes his MS. as Claramontanus, and his notes on the same base. These are not in the Codex, but only a short time at Lyons when Bezæ obtained it. The still earlier history of the MS. is equally doubtful. H. Quentin has produced some interesting but not convincing evidence to show that the MS. was in the possession of the Abbot of Lucerne in the 13th century, and at one time thought that there were traces of Gallicism in the Latin, but the latter's more recent researches go to show that the corrections and annotations varying in date between the 7th and 12th centuries point to a district which was at first predominantly Græco and afterwards became Latin. This would suit South Italy, but not Lyons. The text of this MS. is important as the oldest and best witness in a Græco-MS. to the so-called "Western" text. (See the section Textual Criticism below.)

The following books and articles are important for the history, as apart from the text of the MS. Codex Bezæ... photocopy referenced by Gregory (1890); J. Spitta, "The History of the Bible" (Cambridge, 1864); J. Rendell Harris, "A Study of Cod. Bezæ," Texts and Studies, i. (Cambridge, 1897); J. Rendell Harris, The Annotationes Bezæ, text, and notes; "The Italian Origin of Codex Bezæ," in Journal of Theol. Studies, April 1900, pp. 441 ff.; F. C. Burkitt, "The Date of Codex Bezæ," in the Journal of Theol. Studies, July 1902, pp. 501 ff.; D. H. Quentin, "Le Codex Bezæ à Lyon, etc," Recue Bénédictins, xxxii. 1, 1966.

Codex Alexandrinus (C. M. reg. ID v.-vii., Greg. A, von Soden \( \text{§} 84 \)). An uncial of the 5th century. It was given by Cyril Lucar, Archbishop of Nicomedia, to a monastery near Constantinople, and appears probable that Cyril Lucar had brought it with him from Alexandria, of which he had formerly been a patriarch. Cyril Lucar gave it to a monastery near Constantinople, and it was written by Thecla, a noble lady of Egypt, but this is probably merely his interpretation of an Arabic note of the 14th century which states that the MS. was written by Thecla, the martyr, an obviously absurd interpolation. It is often said to contain the Acts and parts of the Gospels, and under H. Soden's por-ipt, p. 268) has shown from a consideration of displacements in the text of the Apocalypse that it was copied from a very small MS., but this, of course, only holds good of the Apocalypse. It is usually said that this MS., like A, came originally from Egypt, but this is merely a palaeographical guess, for which there is no real evidence. Originally, it contained the whole Bible, but only sixty-four leaves of the Old Testament remaining as the codex. It is one of the 6th century MS. and is also the most important. It is probably the best extant witness to the type of Greek text which was in use in Italy at an early time. It is closely connected with the Vatican codex, and is probably also the archetype of the common text of the 10th century in Paris, Turin, Kiev, Moscow and Mt. Athos. Greg. H, von Soden a 1026, containing fragments of the Pauline epistles, has the same type of text as Codex Bezae in Tischendorf's Codex Claromontanus. It's relations to EFG are best discussed in Westcott and Hort's Introduction, §§ 335-337.

There are no other uncials equal in importance to the above. The next most valuable are probably cod. Regius of the 8th century at Paris, Greg. L, von Soden \( \text{§} 56 \), containing the Gospels; cod. Laudianus of the 7th century at Oxford, Greg. E, von Soden a 1001, a Græco-Latin MS. containing the Acts; codex abibliothecarum of the 15th century in Paris, Turin, Kiev, Moscow and Mt. Athos, Greg. H, von Soden a 1026, containing fragments of the Pauline epistles. These were copied in the metropolitan church of Clarendon, and though of the 10th century, are more closely related to Codex Claromontanus. Further details as to these MSS. with bibliographical care can be found in Gregory's Prolegomena to the Critical Edition. The most valuable are the following:

Lucas Graecus. A MS. of eight MSS. known in Gregory's notation as 13, 60, 124, 346, 543, 788, 926, 988, or in von Soden's as 368, 8, 1211, 1226, 587, 1033, 216, 219, and which, except 69, in spite of the dating implied by von Soden's notation (which is, as already stated, probably written in the 17th century in Calabria), they have a most peculiar text of a largely "Western" type, with some special affinities to the Old Syriac and perhaps to the Diatessaron. They are known as the Ferrar group in memory of the scholar who first collated and published the two MSS. (1899). In their text (which is probably the proper form for Codex Béralicus of the Gospels), and sometimes as fam.14.

It is probably that they have a common archetype in Mark which is also represented by cod. 28 (168), 595 (93, quoted by Tischendorf and others as 29), and 700 (133, quoted by Scrivener and others as 29). They are probably also in the Old Syriac, but it is impossible to identify the locality to which they belonged. Other minuscule importance are cod. 137 (84) at Naples, a manuscript of the 12th century, and probably a second or third generation of the "Neutral" and "Alexandrian" type of text in the gospels; cod. 137 (364) at Milan, a "Western" text of the Acts; a 78 (not in Gregory) in the Laura on Mt. Athos, a MS. of the 12th century, and probably a second or third generation of the "Neutral" and "Alexandrian" type of text and textual comments and notes from Origen.

The text of the Ferrar group was published after Ferrar's death.

[Text of the Ferrar group was published after Ferrar's death]
by T. K. Abbott, *A Collation of Four Important MSS. of the Gospels* (Dublin, 1877). It is best discussed by Rendel Harris's books, *The Origin of the Leicester Codex* (1887), *The Origin of the Ferrar Group* (1893), and *The Ferrar Group* (1900), all published at Cambridge. A discussion of its textual relations is given in K. Lake's "Codex 1 and its Allies" (*Texts and Studies*, vii. 1902); 565 was edited by J. Beilheim in *Das Evangel. des Markus* (1894). The relation of the Latin to the Greek is examined in *Lehrs' Codex Purpureus* (*Texts and Studies*, v. 4; 700 was published by H. C. Hoskier in his collation of cod. Ev. 604, London, 1890; 701 was edited by E. von der Goltz in *Texte und Untersuchungen*, N.F. ii. 4).

(B) The Versions.—These are generally divided into (a) primary and (b) secondary; the former being those which represent translation made at an early period directly from Greek originals, and the latter being those which were made either from Greek versions or from late and unimportant Greek texts.

(a) The primary versions are three—Latin, Syriac, and Egyptian.

Latin Versions.—1. The Old Latin. According to Jerome's letter to Pope Damasus in a.d. 384, there was in the 4th century a "gospel" exactly similar to the text printed in contemporary codices. So-called *Vulgate*, which is printed in E. North's "Codex 1 and its Allies", and the ark of Book 3; and the general attention given to it. It is a Latin translation of the Greek New Testament, also completed by a Latin translation of the Old Testament, in 326. The version is quite numerous, and there are several hundred copies of the text. The Latin version was made by St. Jerome in 405, and was published in 415. The first printed version of the Latin text was published in 1455, by F. Pius II., and was printed at Rome. The Latin version is the only one of the Old Testament to be printed in the Latin text, and is the one which has been most widely used throughout the centuries. It is the basis of the majority of the modern versions of the New Testament, and is the text used by the Catholic Church for the translation of the Bible in Latin.

2. The Latin Vulgate. This version was made by St. Jerome in 405, and was published in 415. The Latin version is the only one of the Old Testament to be printed in the Latin text, and is the one which has been most widely used throughout the centuries. It is the basis of the majority of the modern versions of the New Testament, and is the text used by the Catholic Church for the translation of the Bible in Latin.

3. The Latin Vulgate is the only version of the Old Testament to be printed in the Latin text, and is the one which has been most widely used throughout the centuries. It is the basis of the majority of the modern versions of the New Testament, and is the text used by the Catholic Church for the translation of the Bible in Latin.

Old Latin. *Exemplarius pene quot codices." This is verified or confirmed by examination of the MSS., which have pre-Hieronymian texts. It is customary to quote these by small letters of the Latin alphabet, and to distinguish representatives of the 4th century by the name of the compiler. It is impossible to give the details of the notation. We can distinguish two main types, African and European. The African version is best represented in the gospels by cod. *Bohbeckis* (9) of the 5th century, or the so-called *Vulgate* of the 6th century. It is possible that this version, however, is far the superior in quality; in the Acts and Catholic epistles by cod. *Plectronum* (10), the former being the more important. It belonged to the monks of Pliny, and by the so-called *speculum (m) or collection of quotations formerly attributed to Augustine but probably connected with Spain. This scanty evidence is dated and located as African by the quotations of Cyprian, of Augustine, and of Priscillianus. A bishop of Hymertum (d. 460), from the Apocalypse. It is still a disputed point whether Tertullian's quotations may be regarded as evidence for a Latin version. The use of the Latin version is certain in the 5th century, instead of revisions, attempts were made to fix the text by providing corruptaria, or lists of correct readings, which were the equivalent of critical editions; of these the chief are the Parisian, the Dominican (prepared under Hugo de San Caro about 1240), and the Vatican. In the 15th century the history of the printed Vulgates begins. The earliest is the Mezzet edition of 1452-1456 (*the Masor litterae Vulgates*), but the earliest of a critical nature was that of Robert Etienne in 1528 and 1538-1540. In 1546 the council of Trent decided that the Vulgate should be held as authentica, and in the 16th century its standard authority was generally adopted, and was, probably, at the instigation of St. Charles Borromeo and Pope Clement VIII. in 1592. In the same year, however, the same pope published another edition under the name of Sistus. This is, however, the authority of the Latin Church, and has been used since then been accepted as such in the Latin Church. The critical edition of J. Worsworth (bishop of Salisbury) and H. J. White probably restores the text almost to the state in which Jerome left it.

[The text of the Vulgate may be studied in Worsworth and White, *Novum Testamentum Latinae*, Corssen, *Epituida utala*. *his text is best given in S. Berger's *Histoire de la Vulgate* (Paris, 1803), in which a good bibliography is given on pp. xxi., xxiv., xxv. The section in Kenyon's handbook to the *Textual Criticism of the New Testament* is particularly clear and full. This is only known to us at present through two MSS. of the gospels, containing the Evangelion da-Mepharreshe, or separated gospel, probably so-called in distinction to Tattian's Diatessaron. These gospels were found in a monastery of the 9th century, in the Monastery of the Latins in Palestine. *Codex* of the 9th century is unknown. It contained originally the four gospels in the order Mt., Mk., Lk., Jn., i.e. It is generally quoted as Syriac or Syri C. The Syriac was discovered in 1852 by Mrs Lewis and Mrs Gibson in the library of St. John's College, Cambridge. It was first published in 1864 by R. L. Bensley, J. Rendel Harris and F. C. Burkitt, with an introduction by Mrs Lewis. It is a palimpsest or the upper portion of an ancient manuscript, with the work of "John, the anchorite of Beth Mari Qanoun, a monastery of the Maronites in the city of Antioch. This town is
between Antioch and Aleppo; though the monastery is otherwise unknown, it seems probable that it was the source of many of the MSS. now at Sinai. The under writing seems to be a little earlier than that of the Curetonian; it contains the gospels in the order Mt., Mk., Lk., Jn. Lk. is, as in many MSS., placed first in Mark. The repetition of quotations and references in Aphraates and the Acts of Judas Thomas show that it was known, even if not often used. It seems certain that the Old Syriac version also contains the Acts and Pauline epistles, as Aphraates and Ephraem show. It is a text of equal age with the Peshito, but no MSS. containing this text are at present known.

The text of this version is best given, with a literal English translation, in F.C. Burkitt's *Evangelion da Mepharrase* (Cambridge, 1904, vol. II.).

**Bible [N.T. Versions]**

2. The Peshito (Simple) Version. This is represented by many MSS. dating from the 5th century. It has been proved almost to the certainty of demonstration that the Peshito, containing the gospels was made by Rabbula, bishop of Edessa (411), to take the place of the Diatessaron, and was based on the Greek text which was at that time in current use at Antioch. The Old Testament Peshito is a much older and quite separate version.

The exact limits of Rabbula's work are difficult to define. It seems probable that the Old Syriac version did not contain the Catholic epistles, as the author of the Catena Vaticana, who was presumably added by Rabbula. But he never added 2 Peter, Jude, 2 and 3 John, or the Apocalypse, and the text of these books, which is sometimes bound up with the Peshito, really is that of the Philoxenian or of the Phoenseus, bishop of Antioch in the last century. As the Peshito in Aphraates and Ephraem shows that Rabbula revised the text of the Acts and Pauline epistles, but in the absence of MSS. of the Old Syriac for these books, it is difficult to define the extent of the revision. It seems safe to say that (1) it was made by Rabbula, bishop of Edessa; (2) that it was made in Old Syriac and the Diatessaron; (2) that it was made by Rabbula with the help of the contemporary Greek text of the Antiochene version and for its sake there is good reason to doubt the relations between the Old Syriac and the Diatessaron. Here it is necessary to distinguish between the original text of the Old Syriac and the existing MSS. of it,—Cur. and Sin. There is no doubt that many passages in these show signs of Diatessaron influence, but this is only to be expected if we consider that from the end of the 2nd to the beginning of the 5th century the Diatessaron was the prevailing version of the gospels. A large discount has therefore to be made from the agreements between the Sin and Syr. S and C. Still, it is improbable that this will explain everything, and it is generally conceded that the original Diatessaron and the original Old Syriac were in some way connected. The connexion is variously explained, and efforts have been made to show on which side the dependence is to be found. The most probable theory is that of Burkitt. He thinks that the first Syriac translation was that at Ephesus (A.D. 175), who translated the Diatessaron from Rome and translated it into Syriac. There, in the last days of the 2nd century, when Serapion was bishop of Antioch (196-213), a new translation was made, not necessarily a "separated Gospels" (Evangelion da Mepharrase) was made from the MSS. which was in use at Antioch. Probably the maker of this version was partly guided, especially in his choice of renderings, by the Diatessaron. The text, which remained the more popular and was only driven out by Theodoret and Rabbula in the 5th century, when it was replaced by the Peshito. If this theory be correct the Syriac versions represent three distinct Greek texts,—(1) the 2nd-century Greek text translated from the Peshito; (2) the 2nd-century Greek text from Antioch, used by Rabbula for the Peshito.

The best discussion of this point is in vol. ii. of Burkitt's *Evangelion da Mepharrase*.

**Egyptian Versions.—** Much less is known at present about the history of the Egyptian versions. They are found in various dialects of Coptic, the mutual relations of which are not yet certain, but the only ones which are preserved with any certainty are Upper Egyptian and Sahidic, or Upper Egyptian, through an attempt to replace the literature of the Coptic Church; its history is unknown, but from internal evidence it seems to have been made from good Greek MSS. of the type of KBL, but the date to which this points depends largely on the written evidence, which is largely conjectural. It need not, but may, be earlier than the 4th century. The Sahidic is not so well preserved. G. Horner's researches tend to show that the text used by Sahidic is different from the text represented by the Bohairic, and probably was akin to the "Western" text, perhaps of the type used by Clement of Alexandria. Unfortunately none of the MSS. seems to be good, and at present it is not possible to form any accurate conjecture of the nature of this that is the oldest Coptic version, and this view is supported by the general probabilities of the spread of Christianity in Egypt.

**Coptic.**

[See Gwilliam's "Materials for the Criticism of the Peshito N.T." in *Studia Biblica*, iii. esp. pp. 60-63.]
which suggest that the native church and native literature had their streams mainly in the east and that the stream of the Old Testament must be noted that Westcott and Hort called the Bohairic Memphitic, and the Sahidic Thethea, and Tischendorf called the Bohairic Coptic.

S. G. Hornes "The Coptic Version of the New Testament in the Northern Dialect" (Oxford); Scrivener's "Introduction" (ed. Miller). vol. 2. pp. 91-144; and especially an article on "Egyptian Versions" in Hastings' Dictionary of the Bible, vol. 1. by Forbes Robinson and W. F. H. Souter. In the secondary versions the only one of real importance is the Armenian.

Armenian Version.—The early history of this version is obscure, but it seems probable that there were two translations made in the 4th century: (1) by Mesrop with the help of Hrabanos (Rufinus?) based on a Greek text; (2) by Sahak, bishop of Harput. After the fall of Ephesus, Mesrop and Sahak compared and revised their work with the help of MSS. from Constantinople. The general character of the version is late, but there are many places in which the Old Syriac text can be recognized, and in the Acts and Epistles, where the Old Syriac is no longer extant, this is sometimes very valuable evidence.

Other secondary versions which are sometimes quoted are the Gothic, Ethiopic, Georgian, Arabic, Anglo-Saxon, Frankish, and Persian versions, and the older critical versions are given in Gregory's Prolegomena and in Scrivener's Introduction.

(C) Quotations in Patristic Writings.—The value of this source of evidence lies in the power which it gives us to date and localize texts. Its limitations are found in the inaccuracy of quotation of the writers, and often in the corrupt condition of their text. This latter point especially affects quotations which later scribes frequently forced into accord with the text they preferred.

All writers earlier than the 5th century are valuable, but particularly important are the following groups:—(1) Greek writers in the West, especially Justin Martyr, Tatian, Marcion, Irenaeus and Tertullian. Very little is known of the version made by the author of the de Re compositione and Ambrosiaster; (3) Latin writers in Africa, especially Tertullian and Cyril; (4) Greek writers in Alexandria, especially Clement of Alexandria, Origen, Athanasius and Cyril; (5) Greek writers in the East, especially Methodius of Lycia and Eusebius of Caesarea; (6) Syriac writers, especially Aphraates and Ephraem; it is doubtful whether the Diatessaron of Tatian ought to be reckoned in this group or in (1). None of these groups bears witness to the same text, nor can all of them be identified with the texts found in existing MSS. or versions, but it may be said with some truth that group 2 used the European Latin version of the New Testament in Latin, and group 3 used the Greek in the gospels and the Old Syriac elsewhere, while group 1 has much in common with cod. Bezae, though the difference is here somewhat greater. In group 4 the situation is more complex: Clement used a text which has most in common with cod. Bezae, but is clearly far from identical; Origen in the main has the text of AR; Athanasius a somewhat later variety of the same type, while Cyril has the so-called Alexandrian text found especially in L. Group 4 has a text which cannot be identified with any definite group of MSS. For further treatment of the importance of this evidence see the section Textual Criticism below.

Of all the little satisfactory literature on this subject, outstanding is P. M. Barnard's "Clement of Alexandria's Biblical Text" (Texts and Studies, v. 5), 1899; Harnack's "Eine Novation," in Texte und Untersuchungen, xii, 4; Souter's "The Greek Text and the Septuagint," in volumes of the Textual and Historical Theology's New Testament in the Apostolic Fathers; an article by Kostasch, "Bibeltexte bei Origenes," in the Zeitschrift f. wissenschaftliche Theologie, xiv, 321-378; and on the general subject, especially Neste's Einführung in das griechische Neutestament (Gottingen, 1909), pp. 159-167. (K. L.)

3. Textual Criticism.

The problem which faces the textual critic of the New Testament is to reconstruct the original text from the materials supplied by the MSS., versions, and quotations in early writers, which have been described in the preceding section on the apparatus criticus. His object, therefore, is to analyse and interpret the various readings which occur in the MSS., and to determine whether they have been transmitted from the text, by the usual methods of the textual critic—the collection of material, the grouping of MSS. and other authorities, the reconstruction of archetypes, and the consideration of transcriptional and intrinsic probability. No book, however, presents such a complicated problem or such a wealth of material for the textual critic.

In a certain wide sense the textual criticism of the New Testament began as soon as men consciously made recensions and revisions. As early as the 2d century, Ignatius, Justin, and Tatian, Augustine, and other ecclesiastical writers made notable efforts to gain a textual criticism. But in practice it is general, and certainly convenient, to regard their work rather as material for criticism, and to begin the history of textual criticism with the earliest printed editions which sought to establish a standard Greek Text. It is, of course, impossible here to give an account of all these, but the following may fairly be regarded as the comprehensive books from the beginning to the present time.

The Complutensian.—The first printed text of the Greek Testament as it is known to us, was printed from the direction of Cardinal Ximenes of Alcalá (Lat. Complutensian). It was printed in 1514, and is thus the first printed text, but is not the first published, as it was not issued until 1522. It is not known what MSS. Ximenes used, but it is plain from the character of the text that they were not of great value. His text was reprinted in 1569 by Chr. Plantin at Antwerp.

The first published text was that of Erasmus. It was undertaken at the instance of Joannes Froben (Frobenius), the printer of Basel, who had heard of Cardinal Ximenes's project and wished to forestall it. In this he was successful, as it was issued in 1516. The editions based on his text are, and have remained, really good one (cod. Evang. 1) was seldom followed. Erasmus issued new editions in 1519, 1522, 1527, and 1535, and the Aldine Greek Testament, printed at Venice in 1516, is a reproduction of the first edition.

Stephanus.—Perhaps the most important of all early editions were those of Robert Estienne, or Stephanus, of Paris and afterwards of Geneva. His two first editions (1546, 1549) were based on Erasmus, the Complutensian, and collations of fifteen Greek MSS. These are 1560 volumes, but the third and most important edition (1550) was a folio with a revised text. It is this edition which is usually referred to as the text of Stephanus. A fourth edition (1560) published at Geneva in 1551 is remarkable for giving the division of the text into verses which has since been generally adopted.

Stephanus's apparatus criticus was published, and he also published ten editions between 1555 and 1611. They did not greatly differ from the 1550 edition of Stephanus, but historically are important for the great part they played in spreading a knowledge of the Greek text, and as supplying the text which the Elzevir made the standard on the continent.

Elzevir.—The two brothers, Bonaventura and Abraham Elzevir, published two editions at Leiden in 1624 and 1635, based chiefly on the 1550 edition of Stephanus, but with the aid of the old editions, in some cases with a collation of all non-critical editions on the continent. But in the English 1550 edition of Stephanus has been more generally followed. The importance of both the Stephanus and the Elzevir editions is that they were the first to give the Greek text as we know it, and so prepared the way for the next stage, in which scholars busied themselves with the investigation and collation of other MSS.

The Vallis Polyglot.—The first to begin his work was Brame Walton, bishop of Chester, who published in 1657 the 5th and 6th volumes of his "polyglot" Bible the text of Stephanus (1550) with the readings of fifteen new MSS. besides those employed by Stephanus himself. The collations were made for him by Archibald Usher.

John Fell.—In 1659 John Fell, dean of Christ Church, published the Elzevir text with an enlarged apparatus, but even more important was the help and advice which he gave to the next important critic.

John Mill, of Queen's College, Oxford, influenced by the advice, and supported by the purse of John Fell until the latter's death, published in 1707 a critical edition of the New Testament which has still a considerable value for the scholar. It gives the text of Stephanus (1550) with collations of 78 MSS., besides those of Stephanus, the readings of the Old Latin, so far as was then known, the Vulgate and Peshitto, together with full and valuable prolegomena.

Bentley.—A little later Richard Bentley conceived the idea that it would be possible to reconstruct the original text of the New Testament by a comparison of all the early and critical MSS. He collected material for this purpose, and issued a scheme entitled "Proposals for Printing" in 1720, but though he amassed many notes nothing was ever printed.

Griswold.—To omit the name of William (or Daniel?) Mace, a Presbyterian minister who published The New Testament in Greek and English, in 2 vols. in 1729, and really anticipated many of the verdicts of later critics. He was, however, not in a position to obtain recognition, and his work has been generally overlooked.
BIBLE

N.T. CRITICISM

J. J. Wetstein, one of Bentley’s assistants, when living in Basel in 1730, published "Prolegomena" (in Latin) and in 1734, "Commentary on the Gospels of the New Testament" with enlarged Prolegomena and apparatus criticus. His textual views were peculiar; he preferred to follow late MSS, on the ground that all the earlier copies had been lost. He was the Latin editorial representative of the "Dueber" or "Latin" family of MSS. All the later MSS fall very little short of the best, and a large proportion of the later MSS have a text which is almost identical with that of the Alexandrian family. The father Eusebius, who was the principal criticus of Bentley. His edition is historically very important as it introduced the system of notation which, in the amplified form given to it by Gregory, is still in general use.

J. J. Griesbach, a pupil at Halle of J. S. Semler (who in 1764 reprinted Wetstein’s Prolegomena, and in comments of his own translated and expounded Bentley’s views), compiled many MSS, and distributed them, the Alexandrian or Origenian (which roughly corresponded to Bentley’s African), found in ABCL, the Egyptian version or Origen; the Western, found in D and late authorities; and the Constantinopolitan (Bengel’s African), found in the later MSS and in Byzantine writers. His view was that the last group was the least valuable; but, except when internal evidence forbade (and he thought that it frequently did so), he followed the church in any text. His edition in two parts, the first edition was published in 1747-1757, his second and improved edition in 1796 (vol. 1) and 1806. For the second edition he had the aid of many of his students, especially Cyriac Weiss, and was chiefly concerned with the original edition of his young laborers.

J. M. A. Scholz, a pupil of Hug, inspected and partially collated nearly a thousand MSS and assigned numbers to them which have since been followed. His work is for this reason important, but is unfortunately inaccurate.

K. Lachmann, the famous classical scholar, opened a new era in textual criticism in 1834-1890, in his N.T. Graece et Latin. In this great work a break was made for the first time with the traditional text and the evidence of the late MSS, and an attempt was made to reconstruct the text according to the oldest authorities. This was a step forward, but unfortunately it was accompanied by a retrogression to the pre-Grieschian (or rather pre-Bengalian) days; for Lachmann rejected the idea of grouping MSS, and having selected a small number of the oldest authorities undertook alone the collation of the text. C. Tischendorf, the most famous follower of Lachmann, besides editions of many MSS, and the collation of many more, published between 1857 and 1892 eight editions of the New Testament with full critical notes. The eighth edition which for the first time contained the readings of D, has not yet been equaled, and together with the Prolegomena, supplied by C. R. Gregory after Tischendorf’s death, is the standard critical edition which is used by scholars all over the world. At the same time it must be admitted that it gradually became antiquated. Fresh collations of MSS, and especially fresh discoveries and investigations into the text of the versions and Fathers, have given much new information which entirely changed the character of the evidence for many readings, and rendered a new edition necessary (see Soden, H. von). As a corollary to this evidence Tischendorf was marvellous, but as an editor of the text he added little to the prime work of Lachmann, and, like Lachmann does not seem to have appreciated the value of the Grieschian system of grouping MSS.

S. P. Tregelles, an English scholar, like Tischendorf, spent almost his whole life in the collection of material, and published a critical edition, based on the earliest authorities, at intervals between 1857 and 1872. His work was eclipsed by Tischendorf’s, and his critical system was never in vogue. The conclusions drawn from it, so that his work has obtained less recognition than would otherwise have been the case. Tischendorf and Tregelles finished the work which Wetstein started, and the evidence of the Textus Receptus to be the original text: but neither of them gave any explanation of the relations of the later text to the earlier, nor developed Griesch’s system of dealing with groups of MSS, rather than placing them in collections.

B. F. Westcott and F. J. A. Hort (commonly quoted as WH), the Cambridge scholars, supplied the deficiencies of Lachmann, and without giving up the advantages of his system, and its development by Tischendorf, brought back the study of the text of the New Testament to the methods of Griesbach. Their great work was published in 1881 and 1884, and in 1896, "A Critical Edition of the Greek New Testament." Their view of the history of the text is that a comparison of the evidence shows that, while we can distinguish more than one type of text, the most clearly discernible of all the varieties is first of all the textual tradition of the "Western" family; then almost all the later MSS. Though found in so great a number of witnesses, this type of text is shown not to be the earliest or best, but to have been formed in a veteran tradition, the result of an original text which is very different from the "Western" text, as by internal evidence. Moreover, a comparison with the earlier sources of evidence shows that it was built up out of previously existing texts. This is proved by the "confabulations" which are frequent in it. For instance, the "Western" text of the Gospels, which is followed by the "Western" family, is built up of the "Western," the "Neutral," and the "Alexandrian" text of the same family, and a clumsy sentence which is clearly made up of two earlier readings, and εις θεον ουν δε ζητεουσα χρηστευμεν, found in WH TCL in NBL, εις θεον ουν δε ζητεουσα χρηστευμεν, found in ΔX fam.1, fam.2 28 latt. It is impossible, in face of the fact that the evidence of the oldest witnesses of all sorts is constantly opposed to the longer readings, to doubt that WH are right in arguing that these phenomena prove that the later text was made up by a process of revision and conflation of the earlier forms. Influenced by the use of the later text by Chrysostom, WH called the "Western" text the "Neo-Griesbachian" and the "Neutral" text the "Neo-Lachmannian," and produced it as the Syrian revision. They suggested that it might perhaps be attributed to Lucian, who is known to have made a revision of the text of the LXX. The earlier texts which were used in the process of revision and conflation are called types; there are three: (1) the Western text, used especially by Latin writers, and found also in cod. Bezae and in Syr C; (2) the Alexandrine or Origenian text, found in cod. Caesareus and the earlier recensions of the "Neutral" text; and (3) a text which differs from both the above mentioned and is therefore called by WH the Neutral text, found especially in Β and the quotations of Origen. Of these three types WH thought that the Neutral text was nearest to the original, as it was a clearly a literal recension of it, and WH strove to show that the "Western" text was merely due to the non-literal additions of various parts to improve the narrative. The only exception which they allowed to this general rule was in the case of certain passages in the earlier MSS, especially in the last chapters of Luke, where the "Western" authorities omit words which are found in the Neutral and Alexandrian texts. This is a serious objection that of course is applicable to the Neutral text also, to the genius of the Western text, and that it is therefore probable that these passages represent interpolations made in the text on the Neutral side after the division between it and the Western. This could hardly be called an objection, as the "Western" text is a rather clumsy expression "Western non-interpolations." Having thus decided that the Neutral text was almost always right, it only remained for WH to choose between the various authorities which preserved this type. They decided that the two best groups of MSS were Β and Α, and that when these differed the reading of Β, except when obviously an accidental blunder, was probably right. The work was not intended to be a basis for printing a Revised Version, but merely cremens but explains the late Antiochen text, and that it attempts to consider in an objective manner all the existing evidence and to explain it historically and genealogically. Opinions differ as to the results of the criticism, but probably the conclusion is scarcely room for doubt that as an example of method their work is quite unrivalled at present and is the necessary starting-point for all modern investigation. We shall therefore take the place of Westcott and Hort no work of the same importance appeared until 1909. Various useful texts have been issued, among which those of Nestle (Novum Testamentum Graece, Stuttgart, 1904), based on a comparison of the texts of Tischendorf, WH, and Weiss, and of Baljon (Novum Testamentum Graece, Groningen, 1898), are the best. The only serious attempt as yet published to print a complete text independently of each other editor is that of B. Weiss (Das Neue Testament, Leipzig, 1894-1900), but the method followed in this is so subjective and pays so little attention to the evidence of the versions that it is not likely to be permanently important. The text reached is not widely different from that of WH. The new edition of Weiss and Scholten, which appeared in 1925, does not resemble the earlier editions, and the text is therefore much better than any of the earlier editions. These and the conclusions drawn from it, so that his work has obtained less recognition than would otherwise have been the case. Tischendorf and Tregelles finished the work which Wetstein started, and the evidence of the Textus Receptus to be the original text: but neither of them gave any explanation of the relations of the later text to the earlier, nor developed Griesch’s system of dealing with groups of MSS, rather than placing them in collections.

F. Blass—In his various books on the Acts and third gospel Blass has propounded a new theory as to "Western" text. He was

884
struck by the fact that neither the Western can be shown to be derived from the Neutral, nor the Neutral from the Western. He then proceeds to point out that though the text of the Greek text and represented two recensions by the original writer, and he reconstructed the history as follows. Luke wrote the first edition of the Gospel for Theophilus from Caesarea: this is the Neutral text. Afterwards he retranslated it for the Church in that city; this is the Western (or, as Blass calls it, Roman) text of the Gospel. At a later date Blass has supposed that it was revised for the Roman Church, and published the Western text of the Acts. Finally he revised the Acts and sent a copy to Theophilus; this is the Neutral text of the Acts. This ingenious theory met with considerable criticism by the first advanced critics. It has always been seen that "Western" text does not possess the unity which Blass's theory requires it to have. Still, Blass's textual notes are very important, and there is a mass of material in his books. 

Bousset. These early critics have done much work in trying to identify smaller groups of MSS, with local texts. Bousset has argued that the readings in the Pauline epistles found in #H and a few minuscules represent the text used by Papiamphis, and on the whole this view seems to be highly probable. Another group which Bousset has tried to identify is that headed by B, which he connects with the recension of Hesychius, but this theory, though widely accepted in Germany, does not seem to rest on a very solid basis. To some extent influenced by and using Bousset's results, Schmidtke has tried to show that certain small lines in the manuscripts of Greek text are in keeping with a division between the Neutral and a Roman harmonization, which, by assuming that the Western text of B is Hesychian, he identifies with that of Ammonius. If true, this is exceedingly important. Nestle, however, and other scholars think that the lines in question are but an abbreviation of a more extended passage into semi-paragraphs and have nothing to do with any harmony. 

Rendel Harris and Chase.—Two investigations, which attracted much much when they were published, tried to explain the phenomena of the Western text as due to retranslating from early versions into Greek. Rendel Harris argued for the influence of Latin, and Chase for that of Syriac. Both these works, however, have been found after careful re-examination to contain errors, and it is far from clear that the text of the Western is of a second stage, or that any retranslating can be traced; that they ranked Codex Bezae seems what too highly as the best witness to the "Western" text; that and that some of their work was rendered defective by their failure to recognize the genuine Latin or Syriac text. At the same time, however, little of Rendel Harris's results may ultimately be accepted by the textual critics of the future, his work will always remain historically the first as having done more than anything else to stimulate thought and open new fields of research in textual criticism in the last decade of the 19th century.

The time has not yet come when any final attempt can be made to bring all these separate studies together and estimate exactly how far they necessitate serious modification of the views of Westcott and Hort; but a tentative and provisional judgment would probably to have on somewhat the following lines. The work of Westcott and Hort, of introducing a purely New Testament type of text served in the latter MSS, is not primitive, but built up out of earlier texts; (2) these earlier texts may be classified as Western, Alexandrian and Neutral, of which the Neutral is the primitive form. The Western text has been found to be not so much a result of textual criticism as a continuation of an older text, and has been the basis for most of the modern textual criticism. 

By the year 100 the Gospel had been translated into Latin and was in use from the beginning of the 2nd century. Both of these points to the existence in the 3rd and 2nd century of types of text which differ in very many points from anything preserved in Greek MSS. Yet there is no doubt that both of them ultimately represent the text of the Greek text. 

It is not possible to say, therefore, whether or not the Greek text was used in Alexandria, from which the oldest uncials are directly or indirectly derived. 

In the case of the epistles, the question, therefore, is whether we ought not to base our text on the versions and ecclesiastical quotations rather than on the extant Greek text. 

The second stage is that found in the quotations of Origen which is fairly well represented in #B, though Origen seems to times to have used MSS. of the earlier type. The third stage is WH's 'Alexandrian' for only the quotation of the Neutral text. This is clearly a revision of the second stage, as WH saw, but we can add that it was probably a literary revision but was influenced by the tendency to revive readings which are found in the first stage but rejected in the second.

It thus seems probable that WH's theory must be modified, both as to the time at which it may have been done, and as to the conclusion that the Western text is not a text derived from any one MSS. Both of these points to the existence in the 3rd and 2nd century of types of text which differ in very many points from anything preserved in Greek MSS. Yet there is no doubt that both of them ultimately represent the text of the Greek text. 

It is not possible to say, whether or not the Greek text was used in Alexandria, from which the oldest uncials are directly or indirectly derived. 

In the case of the epistles, the question, therefore, is whether we ought not to base our text on the versions and ecclesiastical quotations rather than on the extant Greek text. 

The second stage is that found in the quotations of Origen which is fairly well represented in #B, though Origen seems to times to have used MSS. of the earlier type. The third stage is WH's 'Alexandrian' for only the quotation of the Neutral text. This is clearly a revision of the second stage, as WH saw, but we can add that it was probably a literary revision but was influenced by the tendency to revive readings which are found in the first stage but rejected in the second.

The Western Text.—This was regarded by WH as a definite text, found in #D, the Old Latin and the Old Syriac; and it is an essential part of their theory that in the main these three witnesses represent one text. On the evidence which they had they would have been undeniably justified, but discoveries and investigation have gone far to make it impossible to hold this view any longer. We now know more about the Old Latin and, that the argument of WH is much more in favor of the Old Syriac. The result is that the authorities on which WH relied for their Western text are seen to bear witness to two texts, not only to those of WH, but to those of the Old Latin and Old Syriac. If a true text was not established at an earlier stage in the history of the text, it cannot be possible to argue, as WH did, on the same side, that the purest form of text was preserved in Alexandria, from which the oldest uncials are directly or indirectly derived. 

WH failed to take account of the evidence of the Old Syriac, which is the oldest of all the witnesses of the text, and which is to be regarded as the one text of the New Testament. 

If we reject this position we must accept the evidence as giving the great uncials much the same secondary importance as Westcott and Hort gave to the Old Latin and Old Syriac, with a mass of versions and Fathers. The adoption of this view sets textual critics a peculiarly difficult task. The first stage in their work must be the establishment of the earliest form of each version. 

The question of the Old Syriac is a matter of profound importance, while it is doubtful how far Tatian's Diatessaron, the quotations in Justin and a few other sources may be used to reconstruct the type of Greek text used in Rome in the 2nd century when Rome was still the central authority.
primarily a Greek church. The second stage must be the comparison of these results and the attempt to reconstruct from them a Greek text. They

By H. and G. F. This Greek, the form Apostolical, D. work New compels 1-1 Criticism un This was conclusions, logians, of current in the Codex and the critics Greek, Dionysius be his undivided 6th century. The Greek, Dionysius, Nero, the Testaments (i.e., 1600-1900), and Diognetus, containing a valuable preface, was also in F. H. Westcott and B. Hort, Introduction to the Criticism of the New Testament (London, 1894). For other points especially important (besides books mentioned in the preceding section) see F. Blass, Acta Apostolorum (Leipzig, 1894); and E. Kern, New Testament (Leipzig, 1896); Rendell Harris, Four Lectures on the Western Text (Cambridge, 1894); F. Chase, The Syro-Latin Text (London, 1895); W. Boussuet, Textkritische Studien (Leipzig, 1894); B. Weiss, Der Codex D in der Apostelgeschichte (Leipzig, 1897); A. Port, Der abendländische Text d. Apostelgeschichte (Leipzig, 1900); G. Salmon, Some Thoughts on Textual Criticism of the New Testament (London, 1897); Schmidtmie, Die Evangelien eines alten Urtextcodices (K.L., 1903).

The New Testament is a series of early Christian writings which the Church came to regard as canonical, i.e., they were placed in the same category as the Old Testament, the writings which were held in later Judaism. Just as the ancient Scriptures were considered to be the Word of God, so that what they contained was necessarily the true and inspired doctrine, so also the New Testament was available for proving the Church’s dogma. The assured canonicity of the whole New Testament resulted in its use by the medieval theologians, the Schoolmen, as a storehouse of proof-texts. Thus the New Testament seemed to exist in order to prove the Church’s conclusions, not to tell its own tale.

The Novum Instrumentum published by Erasmus in 1516 (see above), published 1516, accompanied more than the mere Erasmus. Edilio Principe of the Greek text: Erasmus accompanied it with a Latin rendering of his own, in which he aimed at giving the meaning of the Greek without blindly following the conventional phrasology of the Latin Vulgate, which was the only form in which the New Testament had been current in western Europe for centuries. This rendering of Erasmus, together with its annotations and prefaces to the several books, makes his editions the first great monument of modern Biblical study. Medieval Bibles contain short prefaces by St. Jerome and others. The stereotyped information supplied in these prefaces was drawn from various Jewish sources: Erasmus distinguishes, e.g., between the direct statements in the Acts and the inferences which may be drawn from incidental allusions in the Pauline Epistles, or from the statements of ancient non-canonical writers. This discrimination of sources is the starting-point of scientific criticism.

The early champions of Church reform in the beginning of the 16th century found in the Bible their most trustworthy weapon. The picture of Apostolical Christianity, found in the New Testament offered indeed a glaring contrast to the ceremonies and papal system of the later middle ages. Moreover, some of the “authorities” used by the Schoolmen had been discovered by the New Learning of the Renaissance to be no authorities at all, such as the writings falsely attributed to Dionysius the Areopagite. When, therefore, the breach came, and the struggle between reformers and conservatives within the undivided Church was transformed into a struggle between Protestants and Romanists, it was inevitable that the authority which in the previous centuries had been ascribed to the Church

1 E.g., from the preface to the Acts: “Dionysius, bishop of the Corinthians, a st. (i, 900-1907); E. Nestle and E. Weiss, Die griechische Neutestamentliche Einleitung (2d ed., 1902).”

2 Some in the late 19th century, with Paul the apostle of the Galatians, a work of the middle ages, claimed to be the same day. And again: “Some indubious” or “certain” (not to the narrative of Acts) that Paul was acquainted with his first trial by Nero... This conjecture they make from the 2nd Ep. to Timothy...should be transferred by the Revised Churches to the Bible.

3 The phrase is Chillingworth’s (1637), who may be described as a Broad High-churchman.
The main objection to this presentation, as also to that of the rationalists, is that it is very largely based not upon the historical data, but upon a pre-determined theory. Created this philosophical basis, the criticism proceeded upon the New Testament by Paulus and Strauss follows almost automatically. Herein lies the permanent importance of the work of Ferdinand Christian Baur, professor of theology at Tübingen from 1826 to 1860. The corner-stone of his reconstruction of early Christian history is derived not so much from philosophical principles as from a fresh study of the documents. Starting from Galatians and 1 Corinthians, which are obviously the genuine letters of a Christian leader called Paul to his converts, Baur accepted the Gospels and the Acts, and, for the first time in the history of research, he placed the whole of the New Testament, both the material and the tradition, within the lifetime of a companion of St Paul.

The Johannean writings, i.e. the Fourth Gospel and the three Epistles of John, represent the view of Christ and Christianity taken by a Christian teacher, who seems to have lived and written in Asia Minor at the close of the 1st century A.D. The value of the Fourth Gospel as a narrative of events is a matter of dispute, but the view of the personality of Jesus Christ set forth in it is unquestionably that which the Church has accepted.

The discoveries of papyri in Upper Egypt during recent years, containing original letters written by persons of various classes and in some cases contemporary with the Epistles of the New Testament, have immensely increased our knowledge of the Greek of the period, and have cleared up not a few difficulties of language and expression. More important is the application of Semitic study to elucidate the Gospels. It is indeed true that all the Gospels were written by the disciples of Jesus Christ and the apostles, but the main watchwords of the Gospel theology—phrases like 'the Kingdom of God', 'the World to come', 'the Father in Heaven', 'the Son of Man',—can be more or less reconstructed from Jewish writings, and their meaning gauged apart from the special significance which they received in Christian hands. This line of investigation has been specially followed by Professor G. Dalman in his Worte Jesu. The study of the Semitic elements in early Christianity is less developed than the study of the Greek elements, so that it is doubtful from this Semitic side that further progress in the criticism of the New Testament may be expected.

Bibliography.—See the separate bibliographies to the separate articles in the book on the New Testament. The selection given here of the vast literature on the subject has been so arranged as to give an idea of setting the student on his way.

The subject of the chronology of the New Testament falls naturally into two distinct sections—the chronology of the Gospels, that is, of the life of Christ; and the chronology of the Acts, that is, of the apostolic age.

The Chronology of the Gospels.

The data group themselves round three definite points and the intervals between them: the definite points are the Nativity, the Baptism and the Crucifixion; the age of Christ at the time of the Baptism complements this, and the duration of his public ministry connects the second and third. The results obtained under the different heads serve mutually to test, and thereby to correct or confirm, one another.

1. The date of the Nativity as fixed according to our common computation of Anni Domini (first put forward by Dionysius Exiguus at Rome early in the 6th century) has long been recognized to be too late. The fathers of the primitive church had been
nearer the truth with the years 3 or 2 B.C. (see Irenaeus, *Haer. III. xxi. 3 [xxiv. 2]; Clement of Alexandria, *Strom. I. 21, p. 147; Hippolytus, *in Daniellem*, iv. ed. Bonwetsch, p. 242; *Tertullian*, *Adv. Judaeos*, 8). What may be called the received chronology during the last two centuries has assigned the date farther back to 4 B.C. But the considerations now to be adduced make it probable that the true date is earlier still.

(a) Evidence of St Matthew's Gospel (i. 18-ii. 22).—The birth of Christ took place before the death of Herod, and the evidence of Josephus fixes the death of Herod, with some approach to certainty, in the early spring of 4 B.C. Josephus, indeed, while he tells us that Herod died not long before Passover, nowhere names the exact year; but he gives four calculations which serve to connect Herod's death with more or less known points, namely, the length of Herod's own reign, both from his de jure and from his de facto accession, and the length of the reigns of two of his successors, Archelaus and Herod Philip, to the date of their deposition and death respectively. The various calculations are not quite easy to harmonize, but the extent of choice for the year of Herod's death is limited to the years 4 and 3 B.C., with a very great preponderance of probability in favour of the former. How long before this the Nativity should be placed the Gospel does not enable us to say precisely, but as Herod's decree of extermination included all infants up to two years of age, and as a sojourn of the Holy Family in Egypt of unknown length intervened between the massacre and Herod's death, it is clear that it is at least possible, so far as the evidence of this Gospel goes, that the birth of Christ preceded Herod's death by as much as two or three years. What is thus shown to be possible would, of course, be necessary if we went on, with the astronomer Kepler, to identify the star of the Magi with the conjunction of the planets Jupiter and Saturn which occurred, in the constellation Pisces, in May, October and December of 7 B.C.

(b) Evidence of St Luke's Gospel (ii. 1-8).—The birth of Christ took place at the time of a general census of the empire ordered by Augustus, the first that was held and made at the time when Quirinius was governor of Syria. Against this account it has been urged that we know that the governorship of Syria was held, from 10 or 9 B.C. down to and after Herod's death was held successively by M. Titius, C. Scctius Saturninus, and P. Quintillus Varus; and further, that when Judaea became a Roman province on the deposition of Archelaus in A.D. 6, Quirinius was governor of Syria, and did carry out an elaborate census. The notice in the Gospel, it is suggested, grew out of a confused recollection of the later (and only historical) census, and is devoid of any value whatever. At the other extreme, M. Ramsay *Was Christ Born at Bethlehem?*, 1898, pp. 149 ff.) defends the exact accuracy of St Luke's "first census" as witness- ing to the (otherwise of course unknown) introduction into Syria of the periodic fourteen years' census which the evidence of papyri has lately established for Egypt, at least from A.D. 20 onwards. Reckoning back from A.D. 20, the periodic census should fall in 5 B.C., and Ramsay alleges various causes for delay, which would have postponed the actual execution of the census till 7 B.C., and supposes that Quirinius was an imperial commissioner specially appointed to carry it out. The true sentence, however, remains between the two extreme views. St Luke's statement of a general census is in all probability erroneous, and the introduction of the name Quirinius appears to be due to confusion with the census of A.D. 6. But the confusion in question would only be possible, or at any rate likely, if there really was a census at the time of the Nativity; and it is no more improbable that Herod should have held, or permitted to be held, a local census than that Archelaus of Cappadocia in the reign of Tiberius (Tatius, *Ann. vi. 41) should have taken a census of his own native state "after the Roman manner."

But St Luke's account, when the name of Quirinius is subtracted from it, ceases to contain any chronological evidence.

(c) Evidence of Tertullian.—Strangely enough, however, the missing name of the governor under whom the census of the Nativity was carried out appears to be supplied by an author who wrote more than a century after St Luke, and has by no means a good reputation for historical trustworthiness. Tertullian, in fact (see *Marciem in*, iv. 19), employs against Marcion's denial of the true humanity of Christ the argument that it was well known that Sentius Saturnus carried out a census under Augustus in Judaea, by consulting which the family and relationships of Christ could have been discovered. This Saturnus was the middle one of the three governors of Syria named above, and as his successor Varus must have reigned by the middle of 6 B.C. at latest (for reins of Varus, the extent of the twenty-fifth year of the era of Actium), his own tenure must have fallen about 8 and 7 B.C., and his census cannot be placed later than 7 or 6 B.C. The independence of Tertullian's information about this census is guaranteed by the mere fact of his knowledge of the governor's name; and if there was a census about that date, it would be unreasonable not to identify it with St Luke's census of the Nativity.

The traditional Western day for the Christmas festival, 25th December, goes back as far as Hippolytus, *loc. cit.;* the traditional Eastern day, 27th January, as far as the Basilian Gnostics (but in their case only as a celebration of the Baptism), mentioned by Clement of Alexandria, *loc. cit.*

2. The interval between the Nativity and the Baptism.

(a) Evidence of St Luke's Gospel (iii. 25).—At the time of his baptism Jesus was *ὁρισμός ἐκείνος τῆς ῥάξανθα*, of which words two opposite misinterpretations must be avoided: (i.) *ὁρισμός* does not mean (as Valentinian interpreters thought, Iren. ii. xxii. 5 [xxviii. 3]; so also Epiphanius, *Haer. li. 16*) "beginning to be thirty years old" in the sense of "not yet quite thirty," but at the beginning of His ministry," as in Luke xxii. 39. Acts i. 9. (b) St Luke's statement of the age of Jesus when the Baptism was administered is *ἐκ 30 ἕως 40 χρόνων*; it means "being in the full age of thirty, before which he could not have publicly taught," for if there was by Jewish custom or tradition any minimum age for a teacher, it was not thirty, but forty (Bab. *Talm. ed.* 1715, fol. 10 b; Iren. *loc. cit.). St Luke's phrase is a general one, "about thirty years old," and cannot be so pressed as to exclude some latitude in either direction.

3. The date of the Baptism.

(a) Evidence of St Luke's Gospel (iii. 1).—A terminus a quo for the Baptism is the synchronism of the commencement of the Baptist's public ministry with the fifteenth year of the rule (πρωτεύουσα) of Tiberius. According to the Gospel, he was appointed governor of Syria in A.D. 14, and, reckoned from that point, Tiberius' fifteenth year might be, according to different methods of calculation, either A.D. 28, or 28-29, or 29. But any such result would be difficult to reconcile with the results yielded by other lines of investigation in this article; among alternative views the choice seems to lie between the following:—

(i.) The years of Tiberius are here reckoned. The assumption of some earlier starting-point than the death of his predecessor—probably from the grant to him of co-ordinate authority with Augustus over the provinces made A.D. 12 (see, for the parallel with the case of Caesar and Tiberius, *St Paul the Roman Traveller*, p. 387)—that the fifteenth year would be roughly A.D. 25; or (ii.) St Luke has made here a second error in chronology, caused perhaps in this case by reckoning back from the Crucifixion, and only allowing one year to the ministry of Christ.

(b) Evidence of St John's Gospel (i. 13, 29).—A terminus ad quem for the Baptism is the synchronism of the first Passover mentioned after it with the forty-sixth year of the building of Herod's Temple. Herod began the Temple in the eighteenth year of his reign, probably 39-40 B.C., and the forty-sixth year is probably that of A.D. 27. While too much stress must not be laid on a chain of reasoning open to some uncertainty at several points, it is difficult to suppose with Loisy, *Quatrième Evangile*, 1903, p. 203, that the number was intended
by the evangelist as purely figurative, and is therefore destitute of all historical meaning.

On the whole, the Baptism of Christ should probably be placed in a.D. 26-27; and as the Nativity was placed in 7-6 B.C. (at latest), this would make the age of Christ at his Baptism to be about thirty-two, which tallies well enough with St Luke's general estimate.

3. The interval between the Baptism and the Crucifixion, or, in other words, the duration of the public ministry of Christ.

(a) Evidence of the Synoptic Tradition and of St Mark's Gospel (ii. 23, vi. 39, xiv. 1).—The order of events in the primitive synoptic tradition appears to be faithfully reproduced in St Mark; and if this order is chronological, Christ's ministry lasted at least two years, since the plucking of the ears of corn (April-June) marks a first spring; the feeding of the five thousand when the grass was fresh green (χωρίς: about March), a second; and the Passover of the Crucifixion a third; and these three points are so far removed from one another in the narrative that the conclusion would hold, even if the general arrangement in St Mark were only roughly, and not minutely, chronological.

On the other hand, it may be true that an impression of a brief period of ministry naturally results, and in early generations did actually result, from the synoptic account considered as a whole.

(b) Evidence of St Luke's Gospel (ix. 51-xiii. 28 compared with iv. 14-ix. 50; iv. 10).—Still stronger is the impression of brevity suggested by St Luke. The second and larger half of the narrative of the ministry is introduced at ix. 31 with the words, "It came to pass as the days of His assumption were coming to a close, He set His mind to go to Jerusalem," under which phrase the evangelist cannot have meant to include more than a few months, perhaps not more than a few weeks; so that even if the earlier and shorter half of the account, which describes a purely Galilean ministry ("Judaea." in iv. 44, if it is the true reading, means Judaea in the sense of Palestine), is to be spread over a longer period of time, the combined narrative can hardly have been planned on the scale of more than a single year. St Luke himself may have understood literally, like so many of his readers in ancient times, the reference which he records to the "acceptable year of the Lord" (iv. 19=Isaiah xi. 3): see, too, above, 3 (a) ad fin.

(c) Evidence of St John's Gospel (ii. 13, "the Passover of the Jews was near," and 23, "He was in Jerusalem at the Passover at the feast"); v. 1, "after these things was a feast or [the feast] of the Jews"); vi. 4, "and the Passover, the feast of the Jews, was near"); vii. 2, "and the feast of the Jews, the Tabernacles, was near"); x. 22, "at that time the feast of dedication took place at Jerusalem"); xi. 55, "and the Passover of the Jews was near": besides iv. 35, "say ye not that there is yet a period of four months and harvest cometh? beheld, I tell you, lift up your eyes and see the fields that they are white to harvest"). This catena of time-references is of course unique in the Gospels as a basis for a chronology of the ministry; and it is not reasonable to doubt (with Loisy, loc. cit.), who suggests that the aim was to produce an artificial correspondence of a three and a half years' ministry with the half-week of Daniel; but many and diverse as are the early interpretations of Daniel's seventy weeks, no one before Eusebius thought of connecting the half-week with the ministry), that the evangelist intended these notices as definite historical data, possibly for the correction of the looser synoptic notices and of the eponymous impressions to which they had given rise. Unfortunately, difficulties, either (i.) of reading, or (ii.) of interpretation, or (iii.) of arrangement, have been raised with regard to nearly all of them; and these difficulties must be briefly noticed here.

(i.) Readings (a) v. 1, λαθράς A B D, Origen, Epiphanius, Chrysostom, Paschal Chronicon: ④ supra XCLAD 1-115, 33, the Egyptian versions, Eusebius, Cyril-Alex. (Irenaeus?). The balance of internal evidence —copyists being more likely to accentuate than to diminish the precision of a note of time—clinches, like the balance of external evidence, against the article. (b) vi. 4, τὸ καὶ (theo) is read by all known MSS. and versions; but it has been argued by Hort (in Westcott's and Hort's New Testament in Greek, appendix, pp. 77-81) that four ancient authorities omitted the words, and that their omission simplifies the whole chronology, since "the feast" which was "near" in vi. 4 would then be identical with the feast of Tabernacles mentioned in vii. 2, and all the time-notices of the Gospel could be reduced to a single year, between the Passover of ii. 13 and the Passover of xi. 55. (For objections, see ibid., 182.)

(ii.) Interpretation (a) iv. 35: which is to be taken literally, the "four months to harvest" (about January), or the "fields white to harvest" (about May)? It does not seem possible to rule out either interpretation; the choice between them will follow from the view taken of the general chronological arrangement of the Gospel. (b) v. 1: if "the feast" is read, a choice remains between Passover and Tabernacles (the definite article would be very definite after all); if the more probable "a feast," the greater feasts are presumptively excluded, but a choice remains between, at any rate, Pentecost (May), Trumpets (September), Dedication (December) and Purim (February). Here again, the decision will follow from the view taken on the general chronological arrangement which may be adopted.

(iii.) Arrangement.—So far the amount of possible latitude left is not great as to secure the main outline of the chronology. For a first (ii. 13, 20, second (iv. 7, 14, 15, 35, 36), the other readings are established, with two indeterminate notices (iv. 35, v. 1) between the first and second, and two determinate notices (vi. 2 Tabernacles, xiv. 14 Phædra). But late years (xv. 22 Deeds of Pilate, xvi. 23, 25, 31 Deeds of Herod) are placed in the third. But of late years an increasing desire has been manifested, especially in Germany and America, to manufacture the fourth Gospel on grounds of internal evidence, at first only in the way of partial transpositions of more or less attractive, but lately also by schemes of thorough-going rearrangement. The former class of proposals will as a rule hardly affect the chronology of the Gospel: the latter will affect it vitally. The distinction here drawn may be illustrated from the earliest instance of the former and one of the latest of the latter. In 1871 Archdeacon J. P. Norris (Journal of Philology) wished to transpose chapters v. vi.—ch. vi. was, like ch. vii. and viii., part of the Galilean infancy; and was inserted by himself, "for the sake of the same" what too late a point in the body of the Gospel—and to read "the feast" in v. 1, identifying it with the Passover which was near in vi. 4; in any case, whether "the feast = Passover, or a feast = Pentecost, were read in v. 1, the transposition would not affect the two years' ministry. In 1900 Professor W. B. Bacon (American Journal of Theology, p. 770) proposed a rearrangement of the whole Gospel, according to which the time-notices would occur in the following order: vi. 4, Passover is near; iv. 35, the fields white to harvest = May; v. 1, "a feast = Pentecost; vii. 2, Tabernacles; x. 22, Dedication; xi. 55, Passover is near; xii. 1, Jesus at Bethany (in connexion with the preliminary Passover); xiv. 23, 25, Deeds of Pilate to Jerusalem (ii. 23, an interpolation) for the Passover of the Crucifixion; and the ministry would thus be reduced to a single year. Whether this does not require more notice than the way of argument adopted; as evidence is at present obtainable, the conclusion that the fourth evangelist drew up his narrative on the basis of a two years' rather than a one year's ministry appears to be irrefragable.

Not only do the fourth and second Gospels thus agree in indications of a two years' ministry, but the notes of the middle spring of the three (John vi. 4; Mark vi. 30) both belong to the feeding of the 5000, one of the few points of actual contact between the two Gospels.

The question, however, may still be raised, whether these time-indications of the two Gospels are exhaustive, whether (that is) two years, and two years only, are to be allotted to the ministry. Irenaeus (ii. xxii. 3-6 [xxxii. 1-4]), in favour of a ministry of not less than ten years, appeals (i.) to the tradition of Asia Minor; (ii.) to the record in St John that Christ, who was thirty years old at the time of his baptism, was addressed by the Jews as "not yet [i.e. nearly] fifty years old": but both his arguments are probably derived from a single source, Papius's interpretation of John viii. 57. With this interpretation, however, all ancient writers, whether they enumerated two or three or four Passovers in the Gospel history, believed that the enumeration was exhaustive; and their belief appears correctly to represent the mind of the author of the Fourth Gospel, seeing that his interest is not in the few points of time-references, but in the looser synoptic accounts. Moreover, the wide currency in early times of the tradition of the single-year ministry (I'tolemaeus.
the Early If
1. The Passover celebration could be anticipated by one day in a private Jewish family (and we know perhaps too little of Jewish rules in the time of Christ to be able to exclude this possibility), the evidence of the synoptic Gospels would no longer conflict with that of St. John.

*CHRONOLOGY*

**A.D. 32**
- 4 Apr. 15

It will be seen at once that Friday cannot have fallen on Nisan 14th in any of the three years A.D. 28, 31, and 32. The choice is narrowed down to A.D. 29, Friday, 18th March (Friday, 15th April, would no doubt be too early even for the 14th of Nisan); A.D. 30, Friday 7th April; and A.D. 33, Friday, 3rd April.

**The Civil Year (consul, or regnal years of Tiberius)** in early Christian tradition. It is not a *priori* improbable that the year of the central event from which the Christian Church dated her own existence should have been noted in the Roman age and handed down to the memory of succeeding generations; and the evidence does go some way to suggest that we have in favour of A.D. 29, the consulate of the two Gemini (15th or 16th year of Tiberius), a body of tradition independent of the Gospels and ancient, if not primitive, in origin.

The earliest witness, indeed, who can be cited for a definite date for the crucifixion gave not 29, but 33 A.D. The pagan chronicler, Philostratus, writing in the reign of Hadrian, noted under Olympiad 202:4 (= A.D. 32–33), besides a great earthquake in Bithynia, an eclipse so remarkable that it became night.
“at the sixth hour of the day.” The eclipse meant is, presumably, that of the Crucifixion (so Origen, contra Celsum, ii. 33 [but see in Matt. 134, Dlerule iii. 922], Eusebius’s Chronicle Tib. 19 [= a.D. 33]. Anon. in Cramer’s Catena in Matt. p. 237), but as the notice of it was clearly derived by Phlegon, pagan as he was, directly or indirectly from the Gospel narrative, there is no reason at all to ascribe any independent value to the date. Phlegon may have had grounds for dating the Bithynian earthquake in that year, and have brought the dateless portent into connexion with the dated one. Eusebius adopted and popularized this date, which fell in with his own system of Gospel chronology, but of the year 33 as the date of the Passion there is no vestige in Christian tradition before the 4th century.

The only date, in fact, which has any real claim to represent Christian tradition independent of the Gospels, is the year 29. Tiberius 15 is given by Clem. Alex. Strom. i. 147; Origen, Hom. in Jerem. xiv. 13; cf. c. Cels. iv. 22. Tiberius 16 by Julius Africanus (Routh, Rel. Sacr. ii. 301-304), and Pseudo-Clementine Homilies (a.d. 243) § 20. The consulsip of the two Gemini by Lactantius, Div. Inst. x. 18, and (Lactantius?) de morte pers. § 2; the consulsip of the two Gemini=Tiberius 18 by Hippolytus, Comm. in Danielen, iv. (ed. Bonwetsch, p. 242); the consulsip of the two Gemini=Tiberius 15 by [Tertullian] adv. Judaeos, § 8; the consulsip of the two Gemini=Tiberius 15 (al. 18 or 19) = Ol. 202.4 (this last is a later interpolation from Eusebius) in the Acts of Pilate. Other methods of expressing the year 29 appear in Hippolytus’s Paschal Cycle and Chronicle, and in the Abgar legend (ap. Euseb. Chron. 140.4). But it is impossible to explain Tiberius 16 as a combination of Luke iii. 1 with a one-year ministry, and even to treat Tiberius 15 as an unintelligible repetition from St Luke—though the omission to allow a single year for the ministry would be so strange as to be almost unintelligible—but the date by the consulsip has an independent look about it, and of its extreme antiquity the evidence gives two indications: (i) Hippolytus’s Commentary on Daniel (now generally dated c. a.D. 200) combines it with an apparently inconsistent date, Tiberius 18; the latter is clearly his own combination of the length of the ministry (he says in the same passage that the consulsip in his 133th year) with Luke iii. 1—the consulsip must have been taken from tradition without regard to consistency; (ii) the names of the Gemini are divergently given in our oldest authorities; in [Tert.] adv. Judaeos correctly as Rubellus Geminius and Fufius (or Rufus) Geminius, but in Hippolytus and the Acts of Pilate as Rufus and Rubello. But if the tradition of the consulsip was thus, it would seem, already an old one about the year 200, there is at least some reason to conclude that trustworthy information in early Christian circles pointed, independently of the Gospels, to the year 29 as that of the Crucifixion.

(f) The Civil Month and Day.—The earliest known calculations, by Basilidian Gnostics, quoted in Clem. Alex. Strom. i. 147, gave alternative dates, Phamenoth 25, Pharnamthi 25, Pharnamthi 19; that is, according to the fixed Alexandrine calendar of B.C. 26, 215th March, 20th April, 214th April; in the older, not wholly superseded, Egyptian calendar the equivalents with Roman days varied from year to year. But in all probability these dates were only one development of those speculations in the region of numbers to which Gnosticism was so prone; and in any case to look for genuine traditions among Egyptian Gnostics, or even in the church of Alexandria, would be to misread the history of Christianity in the 2nd century. Such traditions must be found, if anywhere, in Palestine and Syria, in Asia Minor, in Rome, not in Egypt; within the Church, not among the Gnostics. The date which makes the most obvious claim to satisfy these conditions would be the 25th of March, as given by Hippolytus, [Tert.] adv. Judaeos, and the Acts of Pilate (according to all extant MSS. and versions, but see below), loco. cilt.—the same three authorities who bear the earliest witness for the consulsip of the year of the Crucifixion—and by many later writers. It cannot be correct, since no full moon occurs near it in any of the possible years; yet it must be very early, too early to be explained with Dr Salmon (Dictionary of Christian Biography, iii. 928), as originated by Hippolytus’s Paschal cycle of a.D. 221. Now Eusebius (Haer. i. 1) had seen copies of the Acts of Pilate in which the day given was not 25th March, but a.D. 26, kal. Apr. (= 18th March); and if this was the primitive form of the tradition, it is easy to see how 25th March could have grown out of it, since the 18th would from comparatively early times, in the East at any rate, have been thought impossible as falling before the equinox, and no substitution would be so natural as that of the day week, Friday, 25th March. But Friday, 18th March, a.D. 29, was one of the three alternative dates for the Crucifixion which on astronomical and calendar grounds were found (see above, 56) to be possible.

Thus A.D. 29 is the year, the 18th of March is the day, to which Christian tradition (whatever value, whether much or little, be ascribed to it) appears to point. Further, the Baptism was tentatively placed in a.D. 26-27; the length of the ministry was varied, with some approach to certainty, at between two and three years, and here too the resultant date for the Crucifixion would be the Passover of a.D. 29.

To sum up: the various dates and intervals, to the approximate determination of which this article has been devoted, do not claim separately more than a tentative and probable value. But it is submitted that their harmony and convergence give them some additional claim to acceptance, and at any rate do something to secure each one of them singly—the Nativity in 6-7 B.C., the Baptism in a.D. 26-27, the Crucifixion in a.D. 29—from being to any wide extent in error.

The Chronology of the Apostolic Age.

The chronology of the New Testament outside the Gospels may be defined for the purposes of this article as that of the period between the Crucifixion in a.D. 29 (30) on the one hand, and on the other the persecution of Nero in a.D. 64 and the fall of Jerusalem in a.D. 70. Of the events in Christian history which fall between these limits it must be admitted that there are many which with our present information we cannot date with exactness. But the book of Acts, our only continuous authority for the period, contains two synchronisms with secular history which can be dated with some pretence to exactness and constitute fixed points by help of which a more or less complete chronology can be constructed for at least the latter half of the apostolic age. These are the death of Herod Agrippa I. (xii. 23) and the replacement of Felix by Festus (xxiv. 27).

1. The death of Herod Agrippa I. This prince, son of Aristobulus and grandson of Herod the Great, was made (i.) king over the tetrarchy, which had been Herod Philip’s, “not many days” after the accession of Gaius, 16th of March a.D. 37 (ii.) ruler of the tetrarchy of Antipas, in a.D. 30-40; (iii.) ruler of the whole of Palestine (with Abilene), on the accession of Claudius at the beginning of a.D. 41. Josephus’s Jewish Wars and Antiquities differ by one in the number of years they allot to his reign over the tetrarchies (the former work says three years, the latter four), but agree in the more important datum that he reigned three years more after the grant from Claudius, which would make the latest limit of his death the spring of a.D. 44. The Antiquities also place his death in the seventh year of his reign, which would be a.D. 43-44. On the other hand, coins whose genuineness there is no apparent reason to doubt are extant of Agrippa’s ninth year; and this can only be reconciled even with a.D. 44 by supposing that he commenced reckoning a second year of his reign on Nisan 1, a.D. 37, so that his ninth would run from Nisan 1, a.D. 44. On the balance of evidence the only year which can possibly reconcile all the data appears to be a.D. 44 after Nisan, so that it will have been at the Passover of that year that St Peter’s arrest and deliverance took place.

After Agrippa’s death Judaea was once more governed by procurators, of whom Cuspius Fadus and Tiberius Alexander ruled from a.D. 44 to 48; the third, Cumanus, was appointed in a.D. 48; and the fourth, Felix, in a.D. 52. Under Tiberius
Alexander, i.e. in A.D. 46 or 47, occurred the great famine which Agabus had foretold, and in which the Antiochene church sent help to that of Jerusalem by the ministry of Barnabas and Saul (Acts xii. 30. xiii. 25). Thus the earliest date at which the commencement of the first missionary journey (Acts xii. 4) can be placed is the spring of A.D. 47. The journey extended from Salamis "throughout the whole island of Cyprus as far as Paphos, and onward into Syria by way of Antioch, Iconium, Lystra and Derbe, at each of which places indications are given of a prolonged visit (xiii. 40. xiv. 3, 6, 7, 21).

The same places were visited in reverse order on the return journey, as far as Perga on the Pamphylian coast; but instead of revisiting Cyprus the voyage to Syria was this time made direct. In estimating the length of time occupied by this first missionary journey, it must be remembered that a sea voyage could never have been undertaken, and land travel only rarely, during the winter months, say November to March; and as the amount of the work accomplished is obviously more than could fall within the travelling season of a single year, the winter of 47-48 must have been spent in the interior, and return to the coast and to Syria made only some time before the end of autumn A.D. 48. The succeeding winter, at least, was spent again at Antioch of Syria (xiv. 28). The council at Jerusalem of Acts xv. will fall at earliest in the spring of A.D. 49, and as only "certain days" were spent at Antioch after it (xv. 36) the start on the second missionary journey might have been made in the (late) summer of the same year. The "confirmation" of the existing churches of A.D. 50-51, and of Antioch and Derbe (xv. 41. xvi. 5), cannot have been completed under several months, nor would the Apostle have commenced the strictly missionary part of the journey in districts not previously visited, before the opening of the traveling season of A.D. 50. No delay was then made on the Asiatic side: it may still have been in spring when St Paul crossed to Europe and began the course of preaching at Philippi, Thessalonica, Berea and Athens which finally brought him to Corinth. The stay of eighteen months at the last-named place (xviii. 11) will naturally begin at the end of one travelling season and end at the beginning of another, i.e. from the autumn of A.D. 50 to the spring of A.D. 52. From Corinth the Apostle went to Jerusalem to "salute the church," and then again to Antioch in Syria, where he stayed only for "a time" (xviii. 22), and soon left—on the third missionary journey, as conventionally reckoned—proceeding in "order" through the churches of the interior of Asia Minor. These journeys and the intervening halts must have occupied seven or eight months, and it must have been about the end of the year when St Paul established his new headquarters at Ephesus. The stay there lasted between two and three years, and is dated A.D. 50-xx. 9, which places the event before the spring of A.D. 55. From Ephesus he went into Europe, and after "much teaching" given to the churches of Macedonia (xx. 2), spent the three winter months at Corinth, returning to Philippi in the time for the Passover (xx. 3, 6) of A.D. 56. Pentecost of the same year was spent at Jerusalem, and there St Paul was arrested, and kept in prison at Caesarea for two full years, until Festus succeeded Felix as governor (xx. 16. xxiv. 27), an event which, on this arrangement of the chronology of the missionary journeys, would therefore fall in A.D. 58.

Care, however, must be taken to remember exactly what this line of argument amounts to—what it can fairly be said to have proved, and what it still leaves open. It has been shown, firstly, that the missionary journeys cannot have commenced before the spring of A.D. 47, and, secondly, that between their commencement and the end of the two years' imprisonment at Caesarea not less than eleven full years must have elapsed. Consequently A.D. 58 appears to be the earliest date possible for the arrival of Festus. On the other hand, a later date for Festus is not absolutely excluded. It is possible that the first missionary journey should be placed in A.D. 48 instead of A.D. 47, and it is possible, though not probable, that the missionary journeys should be spread over one year more than has been suggested above. At any rate, then, the alternative is open that every date given above, from A.D. 47 to A.D. 58, should be moved on one year, with the result of placing Festus's arrival in A.D. 59.

It is now time to run to the direct evidence for the date of Festus's arrival as procurator, in order to test by it the result already tentatively obtained.

2. The replacement of Felix by Festus. This is the pivot date of the Pauline letters. The two more fortunate schools of critics date it in different years as A.D. 55 and A.D. 60 (or 61). The former are represented by Harnack, the latter by Wieseler, whom Lightfoot follows. It can be said confidently that the truth is between these two extremes (though in what exact year it is not easy to say), as will be evident from a consideration of the arguments urged, which in each case appear less to prove one extreme than to disprove its opposite.

Arguments for the Later Date, A.D. 60 or 61.—(a) St Paul, at the time of his arrest, twice, was urged to proclaim that "for many years past a judge for this nation" (Acts xxiv. 10. 27). It is certain that Felix succeeded Cumanus in A.D. 52, for Tacitus mentions Cumanus's recall under that year. Josephus immediately before the notice of the completion of Claudius's twelfth year [January, A.D. 53], Eusebius probably under Claudius 11, that is, between September 51 and September 52 (for the meaning of the regnal years in Egyptian years see the article "Egyptian Calendar" in the Journal of Theological Studies, January 1900, pp. 188-192).

It is argued that "many years" cannot mean less than six or seven, so that St Paul must have been speaking at earliest in 58 or 59, and Felix might have left Judea in 59. But Lightfoot overlooks the fact that Felix had been in some position which might properly be described as that of "judge for this nation" before he became governor of all Palestine in A.D. 52. In the words of Tacitus, Felix "was the first procurator of the Jews, and of the Palestinian provinces" (Annals, xii. 54); he certainly supposes Felix to have been already governor of Samaria, and apparently of Judaea too, and recognizes Cumanus as governor of Galilee; and Josephus, though he says nothing of this, and treats Cumanus as the sole procurator down to A.D. 52, implies that Felix had been in some position where the Jewish authorities could judge of his fitness when he urged him to return, as if he feared that the high position of which the Roman procurator was presumed to be only a means to some flight from Rome, and that the fact that he asked for his appointment to the procuratorship (Ant. xxviii. 7, 8) that he made on some position of responsibility in Palestine before 55, may have been for some reason confidential. St Paul must have spoken of "many years" at least as early as 56 or 57.

(b) Josephus enumerates after the accession of Nero (October 54) a long catalogue of events which all took place under the procuratorship of Felix, including the revolt of "the Egyptian" which was already "before these days" at the time of St Paul's arrest, two years from the end of Felix's tenure. This suggests, no doubt, that they were in fact all genuine: rebellion of Cleopatra Selene, descent of Quo-in nomine Domini, which was not by 59. But seven years on Nero's rule as a whole make the statement of this procedure would be quite natural on Josephus's part if his recall were dated in 58 or 59, so that four or five years fell under Nero. But the writer of the Letter could not possibly need Josephus in 58; for all the incidents which the historian masses under his account of Felix were successive: events in Emesa, Chalcis, Caesarea and Jerusalem may easily have been synchronic.

The arguments, then, brought forward in favour of A.D. 60 or 61 do not do more than bring the rule of Felix down to 58 or 59.

Arguments for an Early Date, A.D. 55 or 56.—(a) Eusebius's Chronicle places the arrival of Festus in Nero 2, October 55-56, and Eusebius's chronology of the procurators goes back probably through Julius Africanus (himself a Palestinian) to contemporary authorities like the Jewish kings of Judas of Tiberias. But (b) Nero 2 is really Septuagesima 16 to 6 September, 55-6 September, 56. Eusebius may have had any authority to depend on here other than Josephus, who gives no precise year for Festus—Julius Africanus is hardly probable, since we know that his chronicle was very unsure for the Christian period—though Eusebius in the same place questions the Eusebian date.

(b) Felix, on his return to Rome, was prosecuted by the Jews for misgovernment, but was acquitted through the influence of his brother Pallus. Pallus had been minister and favourite of Claudius.

1 Dr C. Erbes (Texte und Untersuchungen, new series, iv. 1) attempts to interpret the evidence of Eusebius in favour of the later date for Festus's arrival as follows: Eusebius tells us (Hist. Eccl. iii. 22. 13) that the writer of the Letter was writing in Nero's 18th year, by striking a mean between the Armenian, Claudius 12, and the Latin, Nero 21; it is really to be understood as reckoned, not by years of Nero, but by years of Agrippa's reign, and Agrippa died in August, 42, leaving by his will, commencing it with A.D. 45 instead of A.D. 50, his date for Festus is five years too early also, and should be moved to Nero 6, A.D. 55-60. The whole of this theory is the present writer's idea, see Journal of Theological Studies (October 1902), pp. 120-123.
but was removed from office in the winter following Nero’s accession, 52-55. Felix must therefore have been tried at the very beginning of Nero’s reign. But this argument would make Felix’s recall—when Festus came in summer, as Acts xxv. 1, xxvii. 1, 9, seem to prove—fall actually under Claudius. And, in fact, it would be a mistake to look upon Pallas’s retirement as a discharge. He stipulated that no inquiry should be made into his conduct in office, and was left for another seven years unmolested in the enjoyment of the fortune he had amassed. There is, therefore, every likelihood that he retained or passed these years enough influence to shield his brother.

Of these arguments, then, the first, so far as it is valid, is an argument for the summer, not of A.D. 55 or 56, but of A.D. 57 as that of the recall, while the second will apply to any of the earlier years of Nero’s reign.

In the result, then, the arguments brought forward in favour of each extreme fail to prove their case, but at the same time prove something against the opposition. Thus Josephus catalogues the events of Felix’s procuratorship under Nero cannot be pressed to bring down Felix’s tenure as far as 60 or 61, but it does seem to exclude as early a termination as 56, or even 57. Conversely, the influence of Pallas at court need not be terminated by his ceasing to be minister early in 55; but it would have been overshadowed not later than the year 60 by the influence of Poppea, who in the summer of that year enabled the Jews to win their cause in the matter of the Temple wall, and would certainly have supported them against Felix. Thus the choice again appears to lie between the years 58 and 59 for the recall of Felix and arrival of Festus.

If St. Paul was arrested in 56 or 57, and appealed to Caesar on the arrival of Festus in 58 or 59, then, as he reached Rome in the early part of the year following, and remained there a prisoner for two full years, we are brought down to the early spring of either 61 or 62 for the close of the period recorded in the Acts. That after these two years he was released and visited Spain in the west, and in the east Ephesus, Macedonia, Crete, Troas, Miletus, and perhaps Achaia and Epirus, is probable, in the one case, from the evidence of Romans xv. 26, Clem. ad Cor. v., and the other, that he was in the same boat with Felix, the trials of the Epistles. These journeys certainly cannot have occupied less than two years, and it is more natural to allow three for them, which takes us down to 64-65.

Early evidence is unanimous in pointing to St. Peter and St. Paul as victims of the persecution of Nero (Clem. ad Cor. v., vi., Dionysius of Corinth ep. Eus. H. E. ii. 25, &c., combined with what we know from Tacitus of the course of the persecution, and from Gaius of Rome, ep. Eus. ii. 25, of the burial-places of the two apostles); and tradition clearly distinguished the fierce outbreak at Rome that followed upon the disturbance of the city in July 64 from the minor disturbances of the Church in the course of the law which the persecution may have initiated. There is, therefore, no reason at all to doubt that both apostles were martyred in 64-65, and the date serves as a confirmation of the chronology adopted above of the imprisonment, release and subsequent journeys of St. Paul.

Investigation, then, of that part of the book of Acts which follows the death of Agrippa, recorded in chap. xii.—i.e. of that part of the apostolic age which follows the year 44—has shown that apparent difficulties can be to a large extent set aside, and that the known facts are to be accounted for by extending to more than a single year. The first missionary journey may have begun in 47 or 48; the arrival of Festus may have taken place in the summer of 58 or 59; the two years of the Roman imprisonment recorded in the last chapter of Acts may have ended in the spring of 61 or 62; and the dates which fall in between these extremes are liable to the same variation. The present writer leans to the earlier alternative in each case, 47, 55, 61; but he willingly concedes that the evidence, as he understands it, is not inconsistent with the later alternative.

But if the events of A.D. 44-64 can thus be fixed with a fair approximation to certainty, it is unfortunately otherwise with the events of A.D. 29-44. Here we are dependent (i.) on general indications given in the Acts; (ii.) on the evidence of the Epistle to the Galatians, which, though in appearance more precise, can be and is interpreted in very different ways.

(i.) The book of Acts is divided, by general consent, from time to time inserted in the narrative, into eight periods: 1. r.v. 25, 36; 2. xi. 13, 20; 3. xvi. 6-xx. 20, xix. 21-xxviii. 31. Of these the three last extend respectively from the death of Herod to the start for Europe in the second missionary journey (A.D. 44 to the spring of 50 [51]), from the start for Europe to the end of the long stay at Ephesus (A.D. 50 [51] to the spring of A.D. 55 [56]), and from the departure from Ephesus to the end of the two years’ captivity at Rome (A.D. 55 [56] to the beginning of A.D. 61 [62]). It will be seen that these periods are of more or less the same length, namely, six or seven years, five years, six years. There is, therefore, some slight presumption that the three earlier periods, which together cover almost 20 years, were intended by so artistic a writer as St. Luke to mark each some similar lapse of time. If that were so, the preaching of the apostles at Jerusalem and organization of the Church at the capital—the preaching of the seven and the extension of the Church all over Palestine—the extension of the Church to Antioch, and the commencement of St. Paul’s work—might each occupy five years or more, or less, that is to say, roughly, A.D. 29-34, 34-39, 39-44. The conversion of St. Paul, which falls within the second period, would on this arrangement fall somewhere between five and ten years after the Crucifixion. Such conclusions are, however, of course general in the extreme.

(ii.) A nearer attempt to date at least the chronology of St. Paul’s earlier years as a Christian could be made by the help of the Galatian Epistle if we could be sure from what point and to what point its reckonings are made. The apostle tells us that on his conversion he retired from Damascus into Arabia, and thence returned to Damascus; then after three years (from his conversion) he went up to Jerusalem, but stayed only a fortnight, and went to the regions of Syria and Cilicia. Then after fourteen years (from his conversion) he returned to Jerusalem and conversed with the elder apostles. Now, if either of these visits to Jerusalem could be identified with any of the visits whose dates have been approximately settled in the chronology of A.D. 44-64, we should have a fixed point from which to argue back. Unfortunately, even less agreement exists on this head than on the question whether the fourteen years of the last-mentioned visit are to be reckoned from the conversion or from the previous visit. Most critics, indeed, are now agreed that the fourteen years are to be calculated from the conversion; and most of them still hold that the visit of St. Paul to Jerusalem about A.D. 49 is the same as the council of Acts xv., and that there is no doubt, on the ground that the latter visit was too important and decisive for St. Paul to have omitted in giving even the most summary description of his relations with the twelve. This ground, however, would be cut away from their feet if it were possible to hold (with J. V. Bartlet, Apostolic Age, 1900, and V. Weber, Die Abfassung des Galaterbriefs vor dem Apostelkonzil, Ravensburg, 1900) that the epistle was actually written just before the council, i.e. in the winter of 48-49 [49-50]. In that case, of course, the two visits of Galatians i. and ii. would be those of Acts ix. 26 and xi. 30. The fourteen years reckoned from the latter would bring us to A.D. 12-13 as the latest possible date for the conversion. With the older view, on the other hand, the fourteen years reckoned from the council in A.D. 49 [50] would allow us to bring down the conversion to A.D. 36. The new view clears away some manifest difficulties in the reconciliation of the Epistle and the Acts, and the early date for Galatians in relation to the other Pauline epistles is not so improbable as it may seem; but the chronology still appears more satisfactory on the older view, which enables the conversion to be placed at least three years later than on the alternative theory. But it is clear that the last word has not been said, and that definite results for this period cannot yet be looked for.

To sum up: an attempt has been made, it is hoped with some success, to provide a framework of history equipped with dates from the time of St. Peter’s arrest by Herod Agrippa I. at the
Passover of A.D. 44 down to the martyrdom of St Peter and St Paul in the persecution of Nero, A.D. 64-65. For the previous period, on the other hand, from A.D. 29 to A.D. 44, it appeared impossible in our present state of knowledge to state conclusions other than in the most general way.

According to the views stated in this article are in general (though with some modifications) the same as those which the present writer worked out with more fulness of detail in Hastings' *Dictionary of the Bible*, i. (1898) 405-424. Of older books, special mention must be made—Lord, *Handbuch der mathematischen und technischen Chronologie* (2 vols., 1825); Wieseler, *Chronologie des apokalypsischen Zeitalters* (1848); Lewin's *Pagi Sacri* (1865). Important modern contributions are to be found in Prof. Ramsay's various works, and in Harnack's *Chronologie der altchristlichen Literatur bis Eusebius*, i. 233-244. Mention should also be made of an article, containing much useful astronomical and talmudic information, by J. K. Fotheringham, "The Date of the Crucifixion," in the *Journal of Philology*, xxix. 100-118 (1904). Mr Fotheringham is of opinion that the evidence from Christian sources is too uncertain, and that the statements of the Mishnah must be the starting-point of the inquiry; taking then the phasis of the new moon as the true beginning of Nisan, he concludes that Friday cannot have coincided with Nisan 14 in any year, within the period A.D. 26-35, other than A.D. 33 (April 3rd). But in one of the two empirical tests of the value of these calculations that he was able to obtain (loc. cit. p. 106, n. 2), the new moon was seen a day earlier than his rules allowed. This being so, it would be premature to disregard these lines of evidence. I have, therefore, opposed my evidence against A.D. 33. Among the latest German works may be cited the chapter on New Testament chronology in the *Neutestamentliche Zeitgeschichte* of Dr Oscar Holtzmann (2nd ed., 1906), pp. 147-147: "regrettably his historical position is based on dispraise, but the mass is undigested and the treatment of the evidence arbitrary. As might be expected, Dr Holtzmann's conclusions are clear and direct. It is seen, therefore, that the Crucifixion is dated on the 7th of April A.D. 30, and St Paul's arrest (with the older writers) at Pentecost A.D. 58. (C. H. T.)

**BIBLE, ENGLISH.** The history of the vernacular Bible of the English race resolves itself into two distinctly marked periods—the one being that of Manuscript Bibles, which were direct translations from the Latin Vulgate, the other that of Printed Bibles, which were, more or less completely, translations from the original Hebrew and Greek of the Old and New Testaments.

1. **The Manuscript Bible.**—The first essays in Biblical translation, or rather paraphrasing, assumed in English, as in many other languages, a poetical form. Even in the 7th century, according to the testimony of Bede (*Hist. Eccl.* iv. 24), Bede sang "de creatione mundi et origine humani generis, et tota Genesis historia, de egressu Israel ex Aegypto et ingressu in terram repromissionis, de allis pluriis sacris Scripturis historiis, de incarnatione Domini, passione, resurrectione et ascensione in coelum, de Spiritus Sancti adventu, et inveniendae sanctae Scripturae testificatione, de psalmo, utraque lingua, in scripturis dominicae, in solemnia diei, in festis, de hominis et utramque sexus anima, de resurrectione mortuorum, de vita praeterea et futura." (Mayor and Lumby, *Beda Hist. Eccl.* p. 178.)

The 9th century is characterized by *interlinear glosses on the Book of Psalms*, and towards its close by a few attempts at independent translation. Of these "glossed Psalters" twelve MSS. are known to exist, and they may be ranged into two groups according to the Latin text they represent. The *Roman Psalter* is glossed in the following MSS.: (1) Cotton Vesp. A. i (Vespasian Psalter); (2) Bodl. Junius 9. i (University of Oxford, 14th cent.); (3) B.M. Harleian Mus. Reg. 2. B. 5; (4) Trin. Coll. Camb. R. 17; (5) (Eastwine's Psalter); (6) Brit. Mus. Add. 37517. The *Gallican Psalter* in the following: (1) Brit. Mus. Stowe 2 (Spelman's text); (2) Cotton Vitell. E. 18; (3) Cotton Tib. C. 16; (4) Lambeth 48; (5) Arundel 60; (6) Salisbury Cath. 150.

The oldest and most important of these MSS. is the so-called *Vespasian Psalter*, which was written in Mercia in the first half of the 10th century. It was in all probability the original from which all the above-mentioned Old English glosses were derived, though in several instances changes and modifications were introduced by successive scribes. The first verse of Psalm c. (Vulg. xii. 2) may serve as a specimen of these glosses.

**Roman Text.**

MS. Vespasian. A. i.

**Gallican Text.**

MS. Stowe. 2.

Wynnunum goede, all corde
SioWaid Dryhtyne in blisse;
inga in gisebile his in
wunsumisse.

Jubilate Deo, omnis terra;
servite Domino in laetitia;
intrate in conspectu eius
in extolatione.

To the late 9th or early 10th century a work may be assigned which is in so far an advance upon preceding efforts as to be a real translation, not a mere gloss corresponding word for word with the Latin original. This is the famous *Paris Psalter*, a rendering of the first fifty Psalms (Vulg. i.-i. 10), contained in the unique MS. lat. 8824 in the Bibliothèque Nationale, Paris. The authorship of this version is doubtful, being by some scholars attributed to King Alfred (d. 901), of whom William of Malmesbury writes (*Gesta Regum Anglorum*, lii. 123), "Psalterium transferre aggressius vix prima parte explicata vivendi finem fecit." This view is, however, denied by others.

In the course of the 10th century the Gospels were translated and the earliest in date is a *Northumbrian Gloss on the Gospels*, contained in a beautiful and highly interesting MS. variously known as the *Durham Book*, the *Lindisfarne Gospels*, or the Book of St Cuthbert (MS. Cotton, Nero. D. 4). The Latin text dates from the close of the 7th century, and is the work of Eadfrith, bishop of Lindisfarne (698-721). The English gloss was added about a century and a half later (c. 950) by one Aldred, whom Dr Charles O'Conor (*Bibl. Sloveniensis*, 1818-1819, ii. 180) supposes to have been the bishop of Durham of that name. The Lord's Prayer is glossed in the following way:

**Lindisfarne Gospels.**

Matthew vi. 9. Suæ donne luð fædor fæder usæ af se æfne se wæs wæs wæs wæs wæs wæs wæs wæs wæs wæs wæs

bist in heofonu in heofone; se gehalgad noma ðin;
in caeli; sanctificetur nomen tuum;

(10) (10) (10) to-cymeð ðin, se wil ðin sauc in heofone
aduen readium regnum tue ful sanultad tua sicut in caele
in terra.

hlafr usorne oferwistic mel se ðuce
dan nostrum super-substantiali] dæ nobis hodie;

færcge uæc sceal swa uæc sceal gesealgum
et demelie nobis debita nostra sicut nos disimulou debitorum

usum. nostris.

(13) (13) (13) (13) (13) (13) (13) (13)

ne inale usih in costunghe að hedir usih from ycle
et ne inducas nos in tentationem sed libera nos a malo. 3

monasteries, amongst the lower clergy, amongst the humble and lowly and ignorant. There were certainly renderings of the Bible during the 12th, 13th and early 14th centuries, but they were all in French. Some of these translations were made in England, some were brought over to England and copied and recopied. Amongst the latter was the magnificently illuminated Norman Commentary on the Apocalypse, some of the earliest copies of which were written in an English hand. In fact before the middle of the 14th century the entire Old Testament and the greater part of the New Testament had been translated into the Anglo-Norman dialect of the period. (MSS. Bibl. Nat. fr. 1, 1562, Brit. Mus. Reg. I.C. iii. Cf. S. Berger, La Bible française au moyen âge, Paris, 1884, pp. 78 ff.)

When English finally emerged victorious, towards the middle and latter half of the 14th century, it was for all practical purposes a new language, largely intermixed with French, differing from the language of the older, 13th period in sound, flexion and structure. It is evident that any Old English versions which might have survived the ravages of time would now be unintelligible, it was equally natural that as soon as French came to be looked upon as an alien tongue, the French versions hitherto in use would fail to fulfil their purpose, and that attempts should again be made to render the Bible into the only language intelligible to the greater part of the nation—into English. It was also natural that these attempts should be made where the need was most pressing, and it is clear that the English Bible was more frequently read and court and were remote, where intercourse with France was difficult.

In fact in the Northern Midlands, and in the North even before the middle of the 14th century, the book of Psalms had been twice rendered into English, and before the end of the same century, probably before the great Wycliffite versions had spread over the country, the whole of the New Testament had been translated by different hands into one or other of the dialects of this period.

At the same time we can record only a single rendering during the whole century which originated in the south of England, namely the text of Judges, Peter, John and the Pauline Epistles (edited by A. C. Pauzes, Cambridge, 1904).

Of these pre-Wycliffite versions possibly the earliest is the West Midland Psalter, once erroneously ascribed to William of Shoreham. 1 It occurs in three MSS., the earliest of which, Brit. Mus. Add. 17376, was probably written between 1340 and 1350. It contains a complete version of the book of Psalms, followed by the usual eleven canticles and the Athanasian Creed. The Latin original is a glossed version of the Vulgate, and in the English translation the words of the gloss are often substituted for the strong and picturesque expressions of the Biblical text; in other respects the rendering is faithful and idiomatic. The following two verses of the first psalm may exemplify this:

\[ MS. British Mus. Add. 17376. \]

\[ (1.1) Beatus ür, qui non habebit in consilio impiorum, \& in sua pecatarum non stetit, et in cathedra iudiciorum, non sedebit. Blessed be he man just in his counsell of wicked, ne stode non in hæc saeuis, et ne stade non in fals toge. \]

\[ (2. Set in lega domini voluntas eius, \& in eis eis meditabitur die oc pacium et in his hæc saeuis. Sit in hæc saeuis, \& in eis eis meditabitur. \]

Before the middle of the century Richard Rolle (g.v.), the hermit of Hampole (+ 1349), turned into English, with certain additions and omissions, the famous Commentary on the Psalms by Peter Lombard. The work was undertaken, as the metrical prologue of one of the copies tells us (MS. Laud. misc. 380), “At a worthy reclus poverty, call dame Merget Kyrkby.” The Commentary gained immediate and lasting popularity, and spread in numerous copies throughout the country, the peculiarities of the hermit’s vigorous northern dialect being either modified or wholly removed in the more

1 See Stevenson, Waring and Skeat, op. cit.

southerly transcripts. The translation, however, is stiff and literal to a fault, violating idiomatic usage and the proper order of words in its strict adherence to the Latin. The following brief extracts may exemplify the hermit's rendering and the change the text underwent in later copies.

**MS. Univ. Coll. 64.**

(i. 1) Blissful man ye whilk owyd yeid nocht in ye consuelle of wicked, and in ye waye of synful stode nocht, & in ye chaire of pestilens he sone sate. (2) But in lade of lord he wil of him; and in his lade he sall thynke day & nyght.

Approximately to the same period as these early renderings of the Psalter belongs a version of the Apocalypse with a Commentary, the earliest MS. of which (Harleian 874) is written in the dialect of the North Midlands. This Commentary, for a long time attributed to Wycliffe, is really nothing but a rendering of the popular and widely-spread Norman Commentary on the Apocalypse (Paul Meyer and L. Delisle, L'Apocalypse en Français au XI² siècle, Paris, 1901), which dates back as far as the first half of the 13th century, and in its general tenor represents the height of orthodoxy. The English apocalypse, to judge from the number of MSS. remaining, must have enjoyed great and lasting popularity. Several revisions of the text exist, the latter of which present such striking agreement with the later Wycliffite version that we shall not be far wrong if we assume that this is the main use of to a considerable extent by the revisers of this version.

To the North Midlands or the North belongs further a complete version of the Pauline Epistles found in the unique MS. 32, Corpus Christi College, Cambridge, of the 15th century. **Commentaries on the Gospels of St Matthew, St Mark and St Luke**, we are told by the heading in one of the MSS. (Univ. Libr. Camb. li. 2. 12), were also translated into English by "a man of ye north countre." The translation of these Gospels as well as of the Epistles referred to above is stiff and awkward, the translator being evidently afraid of any departure from the Latin text of his original. The accompanying commentary is based on the transliterations of the Fathers of the Church and entirely devoid of any original matter. The opening lines of the third chapter of Matthew are rendered in the following way—

**MS. Camb. Univ. Libr. li. 2. 12.**

(iii. 1) In ye dayes come Ihone baptism prechand in desert of ye lewry, & seyand, (2) Do ye penance; forwhy ye kyngdome of heuyne sal come negh. (3) Pia is he of whomse it was seide be Isay ye prophete, sayand. 1 be voice of ye cryand in ye desert, redey ye way of God, righte made ye leyli waves of him." (4) & Ihone his klyenig of ye hoers of camels, & a gyrdy of a skyn about his lendys; & his mete was je locust & honye of je wode.

A version of the Acts and the Catholic Epistles completes the number of the New Testament books translated in the northern parts of England. It is found in several MSS., either separately or in conjunction with a fragmentary Southern Version of the Pauline Epistles, Peter, James and 1 John in a curiously compiled volume, evidently made, as the prologue tells us, by a brother superior for the use and edification of an ignorant "sister," or woman vowed to religion. 2 The translation of this, our only southern text, surpasses all previous efforts from the point of view of clearness of expression and idiomatic use of English, and, though less exact, it may be even said in these respects to rank equal with the later or revised Wycliffe version.

Apart from these more or less complete versions of separate books, there existed also numerous renderings of the Lord's Prayer, the Ten Commandments, accounts of the Life, Passion and Resurrection of our Lord, translations of the

3 Epistles and gospels used in divine service, and other means of familiarizing the people with Holy Scripture. It was the custom of the medieval preachers and writers to give their own English version of any text which they quoted, not resorting as in later times to a commonly received translation. This explains the fact that in collections of medieval homilies that have come down to us, no two renderings of the Biblical text used are ever alike, not even Wycliffe himself making use of the text of the commonly accepted versions that went under his name.

It is noteworthy that these early versions from Anglo-Saxon times onwards were perfectly orthodox, executed by and for good and faithful sons of the church, and, generally speaking, with the object of assisting those whose knowledge of Latin proved too scanty for a proper interpretation and understanding of the holy text. Thus Richard Rolle's version of the Psalms was executed for a nun; so was in all likelihood the southern version of the epistles referred to above. Again the earliest MS. (Harl. 874) of the Commentary on the Apocalypse gives the owner's name in a compressed form as "Richard Schepard, presbiter," and the Catholic Epistles of MS. Douce 250 were probably glossed for the benefit of men in religious orders, if one may judge from a short Commentary to James i. 2, " & jerflore if any man come into sowe sitt, bat is, into sowe camarvye bat bep Godes goshious men in what dege so be." Nor do any of the remaining works contain anything but what is strictly orthodox.

It is first with the appearance of Wycliffe (q.v.) and his followers on the arena of religious controversy that the Bible in English came to be looked upon with suspicion by the orthodox Church. It is within the C14th that one finds that Wycliffe proclaimed the Bible, not the Church or Catholic tradition, as a man's supreme spiritual authority, and that he sought in consequence by every means in his power to spread the knowledge of it among the people. It is, therefore, in all likelihood to the zeal of Wycliffe and his followers that we owe the two noble 14th-century translations of the Bible which tradition has always associated with his name, and which are the earliest complete renderings that we possess of the Holy Scriptures into English.

The first of these, the so-called Early Version, was probably composed about 1325, at all events before 1354, the year of Wycliffe's death. The second, or Later Version, being a thorough revision of the first, is ascribed to the year 1388 by Sir Frederic Madden and the Rev. Joshua Forshall in their edition of these two versions.

It is a matter of uncertainty what part, if any, Wycliffe himself took in the work. The editors of the Wycliffite versions say in the Preface, pp. xv. fi.—"The New Testament was naturally the first object. The text of the Gospels was extracted from the Commentary upon them by Wycliffe, and to these were added the Epistles, the Acts and the Apocalypse, all now translated. This translation might probably be the work of Wycliffe himself; at least the similarity of style between the Gospels and the other parts favours the supposition." The Wycliffite authorship of the Commentaries on the Gospels, on which the learned editors base their argument, is, however, unsupported by any evidence beyond the fact that the writer of the Prologue to Matthew urges in strong language "the propriety of translating Scripture for the use of the laity." The Biblical text found in these Commentaries is in fact so far removed from the original type of the Early Version as to be transitional to the Late, and, what is still more convincing, passages from the Early Version, from both the Old Testament and the New Testament, are actually quoted in the Commentary. Under such circumstances it would be folly to look upon them as anything but late productions, at all events later than the Early Version, and equal folly to assign these bulky volumes to the last two years of Wycliffe's
life merely because the text used in them has to be that of the Early Version. It is therefore at present impossible to say what part of the Early Version was translated by Wycliffe.1

The Old Testament of the Early Version was, according to the editors (Preface, p. xvii.), taken in hand by one of Wycliffe’s coadjutors, Nicholas de Herford. The translator’s original copy and a coeval transcript of it are still extant in the Bodleian Library (Bodl. 959, Douce 356). Both break off abruptly at Baruch iii. 19, the latter having at this place a note inserted to the following effect: Explicit translationem Nicolai de herford. There is no change, but little doubt that Nicholas de Herford took part in the translation of the Old Testament, though it is uncertain to what extent. The translator’s copy is written in not less than five hands, differing in orthography and dialect. The note may therefore be taken to refer either to the portion translated by the last or fifth hand, or to the whole of the Old Testament up to Baruch iii. 19. Judging from uniformity of style and mode of translation the editors of the Bible are inclined to take the latter view; they add that the remaining part of the Old Testament was completed by a different hand, the one which also translated the New Testament. This statement is, however, not supported by sufficient evidence. In view of the magnitude of the undertaking it is contrary highly probable that other translators besides Wycliffe and Nicholas de Herford took part in the work, and that already existing versions, with changes when necessary, were incorporated in the translation by the translators.

The Early Version, apart from its completeness, shows but little advance upon preceding efforts. It is true that the translation is more careful and correct than some of the renderings noticed above, but on the other hand it shares all their faults. The translation of the Old Testament as far as Baruch iii. 19 is stiff and awkward, sometimes unintelligible, even nonsensical, from a too close adherence to the Latin text (e.g. Judges xx. 23). In the remaining parts the translation is somewhat easier and more skillful, though even here Latinisms and un-English renderings abound.

It is small wonder, therefore, if a revision was soon found necessary and actually taken in hand within a few years of the completion of the Earlier Version. The principles of work adopted by the revisers are laid down in the general preface to their edition, the so-called “Later Version.”

For these reasons and other ... a symple creature hath translatis the bible out of Latyn into English. First, this symple creature hath used the Latyn, with divers felawis and helpeis, to geder manie elde biblis, and other doctours, and comune glossis, and to make oo Latyn bible surned trewe; and thanne to studye it of the newe, the text with the glose, and other doctours, as he mithgete, and spechi Lire on the ole testament, that helpeful fyl myche in this work; the thridle tyme to conseille with elde gramariens, and elde gramariens, and elde gramiens, and of harde words, and harde sentences, how thi misten best be vnderstanden and translatai; the iij tyne to translate as cleerly as he coude to the sentence, and to have manie gode felawis and kunnynge at the correcting of the translacioum.

It is uncertain who the revisers were; John Purvey, the leader of the Lollard party after Wycliffe’s death, is generally assumed to have taken a prominent part in the work, but the evidence of this is extremely slight (cf. Wycl. Bible, Preface, pp. xxv. f.). The exact date of the revision is also doubtful: the editors of the Wycliffe Bible, judging from the internal evidence of the Prologue, assume it to have been finished about 1388. This Revised or Later Version is in every way a readable, correct rendering of the Scriptures, it is far more idiomatic than the Earlier, having been freed from the greater number of its Latinisms; its vocabulary is less archaic. Its popularity admits of no doubt, for even now in spite of neglect and persecution, in spite of the ravages of fire and time, over 150 copies remain to testify to this fact. The following specimens of the Early and Late Versions will afford a comparison with preceding renderings:

---

chyer. (3) Do, penance, for the kyngdome of heuens shal
meli, or came nee. (4) Forsothe he shal seyn the same, or come nee.
(5) Hence to the prophete, A voice of a cryinge in desert. Make 3e redy
with the voyces of the Lord; make 3e rytful to the voyces of the
prophet. Ysaye, The prophete. (6) Forsothe that ilk loon hadde h redemption
de the heers of cameylins, and a gund of sone, while he bokendis;
sothely his mete weren locustis, and hony of the wode.

Late Version.

(1.1.) Blessed is the man, that
de not in the counsel of wicked
men; and stood not in the
chamber of pestilence. (2.) But
his will is in the lawe of the
Lord; and he shal behente
thee in the lawe of hym, and
not in the chamber of pestilence.

The 15th century may well be described as the via dolorosa of the English Bible as well as of its chief advocates and supporters, the Lollards. After the death of Wycliffe violence and anarchy set in, and the Lollards came gradually to be looked upon as enemies of order and disturbers of society. Stern measures of suppression were directed not only against them but against “Godlis Lawe,” the very book which they professed with such passionate earnestness. The bishops’ registers bear sufficient testimony to this fact.2 It would appear, however, as if at first at all events the persecution was directed not so much against the Biblical text itself as against the Lollard interpretations which accompanied it. In a conversation held at Oxford under Archbishop Arundel in 1408 it was enacted “that no man hereafter by his own authority translate any text of the Scripture into English or any other tongue, by way of a book, booklet, or tract; and that no man read any such book, booklet, or tract, now lately composed in the time of John Wycliffe or since, or hereafter to be set forth in the said book, booklet, or tract.”3 The word “hereafter” was necessary to allow of reprints of the earlier versions. The excommunication, until the said translation be approved by the ordinary of the place, or, if the case so require, by the council provincial. He that shall do contrary to this shall likewise be punished as a favourer of heresy and error.”4

It must be allowed that an enactment of this kind was not without justification. The Lollards, for instance, did not hesitate to introduce into certain copies of the psious and orthodox Commentary on the Psalms by the hermit of Hampole interpolations of their own of the most virulently controversial kind (MSS. Trin. Coll. Camb. B.V. 25, Brit. Mus. Reg. 18. C. 26, &c.), and although the text of their Biblical versions was faithful and true, the General Prologue of the Later Version was interlarded with controversial matter. It is small wonder if the prelates and priests sought to repress such trenchant criticism of their lives, and doctrines as appeared more especially in the former work, and probably in many others which since have perished in “faggots and burning.” For all this, manuscripts of Purvey’s Revision were copied and re-copied during this century, the text itself being evidently approved by the ecclesiastical authorities, when in the hands of the right people and if unaccompanied by controversial matter. Of the Lollard movement in Scotland but little is known, but a curious relic has come down to us in the times of the shape of a New Testament of Purvey’s Revision in the Scottish dialect of the early 16th century. The transcriber was in all probability a certain Murdoch Nisbet, who also showed his reforming tendencies by adding to it a rendering of Luther’s Prologue to the New Testament.5

3Wilkin’s Concilia, iii. 317.
BIBLE, ENGLISH

2. The Printed Bible.—It is singular that while France, Spain, Italy, Bohemia and Holland possessed the Bible in the vernacular before the accession of Henry VIII., and in Germany the Scriptures were printed in 1456 and seventeen times the press at Strasburg became in great work, yet no English printer attempted to put the familiar English Bible into type. No part of the English Bible was printed before 1525, no complete Bible before 1555, and none in England before 1538.

Versions of the Scriptures so far noticed were all secondary renderings of the Vulgate, translations of a translation. It was only with the advent of the "new learning" in England that a direct rendering from the originals became possible. Erasmus in 1516 published the New Testament in Greek, with a new Latin version of his own; the Hebrew text of the Old Testament had been published as early as 1484.

The first to take advantage of these altered conditions was William Tyndale (q.v.), "to whom," as Dr Westcott says,1 "it has been allowed more than to any other man to give its characteristic shape to the English Bible." Of Tyndale's early life but little is known. Be it enough for our purpose to say that he thoroughly saturated his mind with the "new learning," first at Oxford, where in 1515 he was admitted to the degree of M.A., and then in Cambridge, where the fame of Erasmus still lingered. Before the beginning of 1520 we find Tyndale as chaplain in the household of Sir John Walsh of Old Sodbury in Gloucestershire. He was there constantly involved in theological controversies with the surrounding clergy, and it was owing to their hostility that he had to leave Gloucestershire. He then resolved to open their eyes to the serious corruptions and decline of the church by translating the New Testament into the vernacular. In order to carry out this purpose he repaired in July or August 1523 to London, and to the famous protector of scholars and scholarship, Bishop Cuthbert Tunstall. His reception was, however, cold, the Earl of Shrewsbury refusing to seek a licence for the printing in the town. During a year of anxious waiting, it became clear to him "not only that there was no room in my lorde of london palace to translate the new testament, but also that there was no place to do it in englande." In May 1524 he consequently betook himself to Hamburg, his resolution to carry out his great work never for a moment flagging, and it was probably during his stay in this free city and in Wittenberg, where he may have been stimulated by Luther, that his translation of the New Testament was actually made. At all events there is no doubt that in 1525 he was in Cologne, engaged in printing at the press of Peter Quintel a quarto edition of the New Testament. This edition was provided with prefaces and marginal glosses. He had advanced as far as the tenth sheet, bearing the signature K, when his work was discovered by Johann Cochlaeus (q.v.), a famous controversialist and implacable enemy of the Reformation, who not only caused the Senate of Cologne to prohibit the continuation of the printing, but also communicated with Henry VIII. and Wolsey, warning them to stop the importation of the work at the English seaports. Tyndale and his assistant, William Roye, managed, however, to escape higher up the Rhine to Worms, and they succeeded in carrying with them some or all of the sheets which had been printed. Instead of completing Quintel's work, Peter Schoffer, the Worms printer, was employed to print another impression of 1000 in a small octavo size, without prefaces to the books or annotations in the margin, and only having an address "To the Reeder" at the end in addition to the New Testament itself. Two impressions, the quarto having possibly been completed by Schoffer, arrived in England early in the summer of 1526, and were eagerly welcomed and cherished. Such strong measures of suppression were, however, at every attempt against these perilous undertakings. Of the octavo only one perfect copy (the title-page missing) in the Baptist College at Bristol, and one imperfect in the library of St Paul's cathedral.

But Tyndale pursued his labours undaunted. In 1534 the manuscript translation of Deuteronomy is mentioned as having perished with his other books and papers in a shipwreck which he suffered on the coast of Holland, on his way to Hamburg. In 1530, however, the whole of the Pentateuch was printed in Marburg by Hans Luft; it is provided with prefaces and marginal annotations of a strongly controversial character. The only perfect copy is preserved in the Grenville library of the British Museum. It was reissued in 1534 with a new preface and certain corrections and emendations in Genesis, and again in London in 1531. In 1536 the Book of Jonah appeared with an important and highly interesting prologue, the only copy known of which is in the British Museum.

Meanwhile the demand for New Testaments, for reading or for the flames, steadily increased, and the printers found it to their advantage to issue the Worms edition of the New Testament in not less than three surreptitious reprints before 1534. This is testified by George Joye in his Apology, who himself brought out a fourth edition of Tyndale's New Testament in August 1534, freed from many of the errors which, through the carelessness of the Flemish printers, had crept into the text, but with such alterations and new renderings as to arouse the indignation of Tyndale. The only remaining copy, a 16mo, is in the Grenville library. To counteract and supersede all these unauthorized editions, Tyndale himself brought out his own revision of the New Testament with translations added of all the Epistles of the Old Testament after the use of Salisbury. It was published in November 1534 at Antwerp by Martin Emperewer. Prologues were added to all books except the Acts and the Apocalypse, and new marginal glosses were introduced. In this edition the three in the British Museum, and it was reprinted in 1541 in Bagster's Hexapla. In the following year Tyndale once more set forth a revised edition, 4 "fynessed in the yere of oure Lorde God A.M.D. and XXXV.," and printed at Antwerp by Godfried van der Hagen. In this headings were added to the chapters in the Gospels and the Acts, and the marginal notes of the edition of 1534 were omitted. It is chiefly noted for the peculiarities of its orthography. Of this edition one copy is in the University library, Cambridge, a second in Exeter College, Oxford, and a fragment in the British Museum. It is supposed to have been revised by Tyndale while in prison in the castle of Vilvorde, being the last of his labours in connexion with the English Bible. His execution took place on the 6th of October 1536, and about the same time a small folio reprint of his revised edition of 1534 was brought out in England, the first volume of Scripture printed in this country, probably by T. Berthelet. A perfect copy is found in the Bodleian library. In later years, between 1536 and 1550, numerous editions of Tyndale's New Testament were printed, twenty-one of which have been enumerated and fully described by Francis Fry.4

"The history of our English Bible begins with the work of Tyndale and not with that of Wycliffe," says Dr Westcott in his History of the English Bible, p. 316, and it is true that one of the most striking features of the work of Tyndale is its independence. Attempts have been made to show that especially in the Old Testament he based a great deal of his work on the Wycliffite translations, but in face of this we have his own explicit

statement, "I had no man to counterfeit, neither was holp with englysshe of any that had interpreted the same (i.e. the New Testament), or soche lyke thinge the scripture beforeyme." He translated straight from the Hebrew and Greek originals, although the Vulgate and more especially Erasmus's Latin version were on occasion consulted. For his prefaces and marginal notes he used Luther's Bible freely, even to paraphrasing or verbally translating long passages from it.

Apart from certain blemishes and awkward and even incorrect renderings, Tyndale's translation may be described as a truly noble work, faithful and scholarly, though couched in simple and popular language. Surely no higher praise can be accorded to it than that it should have been taken as a basis by the translators of the Authorized Version, and thus have lived through the centuries up to the present day.

The following specimens may prove of interest:—

The thryde Chapter.

(Mark iii. 1-4.) In those days Iohn the baptysyer came and preached in the wyllernes of Iury, sayenge, Repent, the kyngdemon of heven ys at hand. Thys ye he of whom it ys spokyn be the prophet Isay, whych sayth: the voice of a cryer in wyllernes, prepaire ye the lodes wyre, and make hyys pathes straights. Thys had beenys ye kyngdemon of heven, an parrythly goodly vmbre, a grydylde of a sommon about hyys lyones. Hys meate was locustes * and wyldernes onye.*

* * * Locustes are more then awere greshoppers, souche men vse to paynt in divers partes of the est. (marginal note.)

(Matt. iii. 2.) The locusts were oure familye. Our home was in heven, haleweyd to be thy name. Let thy kingdome come. Thys wyll be fullfilled, as well in erte, as hit ys in heven. Geve vs this daye oure dryde breade. This is a true image for the men of God, agreeable to God. (English, 1551-1553.)

These "fyue interpreters" Dr. Westcott (ibid. p. 161) identifies as Luther, the Züricher Bible, the Latin version of Pagninus, the Vulgate, and, in all likelihood, the English translation of Tyndale. Though not endowed with the strength and originality of mind that characterized Tyndale's work, Coverdale showed great discrimination in the handling and use of his authorities, and moreover a certain delicacy and happy ease in his rendering of the Biblical text, to which we owe not a few of the beautiful expressions of our present Bible.

The following extract from the edition of 1535 may serve as examples of his rendering:

The first psalme.

(1-2.) Blessed is he man, he goeth not in the counsell of ungodly: he ablytheth not in the waye of synners, & sytteth not in the seate of the scornful. But delighteth in the lawe of Iorde, & exercyseth himselfe in his lawe both dayly and night.

The gospel of S. Mathew.

(iii. 1-4.) In those days Iohn the Baptysyer came and preached in the wildernesse of Iury, sayenge: Amenye youre selfes, the kyngdome of heuen is at hone. This is he, of whom it is spoken by the prophet Esay, which sayeth: The voyce of a cryer in wyllernes, prophesie: ye Iorde saith, and make his pathes straight. This Iohn had his garment of camels beer, and a lethern gerdell aboute his loynes. Hys meate was locustes and wyldy hone.

It should be added that Coverdale's Bible was the first in which the non-canonical books were left out of the body of the Old Testament and placed by themselves at the end of it under the title Aporcipha.

The large sale of the New Testaments of Tyndale, and the success of Coverdale's Bible, showed the London booksellers that the old and profitable branch of business was still open to them, and they soon began to avail themselves of its advantages. Richard Grafton and Edward Whitchite were the first in the field, bringing out a fine and full-sized folio in 1537, "truly and purely translated into English by Thomas Matthew." Thomas Matthew, is, however, in all probability, an alias for John Rogers, a friend and fellow-worker of Tyndale, and the volume is in reality no new translation at all, but a compilation from the renderings of Tyndale and Coverdale. Thus the Pentateuch and the New Testament were reprinted from Tyndale's translations of 1530 and 1535 respectively, with very slight variations;

1 See Dr. Ginsburg's information to Mr. Tredler, D.N.B. xii. 365.
3 Remains, Parker Soc., pp. 11 f.
the books from Joshua to the end of Chronicles are traditionally, and lately also by external evidence, assigned to Tyndale and were probably left by him in the hands of Rogers. From Ezra to Malachi the translation is taken from Coverdale, as is also that of the Apocryphal books. John Roger's own work appears in a marginal commentary distributed through the Old and New Testaments and chiefly taken from Olivetan's French Bible of 1535. The volume was printed in black letter on double columns, and three copies are preserved in the British Museum. In 1538 a second edition in folio appeared; it was reprinted twice in 1540, and again in 1551. It is significant that this Bible, like Coverdale's second edition, was "sett forth with the kings most gracious lycense," probably with the concurrence of Cranmer, since he, in a letter to Cromwell, begged him to "exhibit the book unto the king's highness, and to obtain of his grace . . . a licence that the same may be sold and read of every person, without danger of any act, proclamation or ordinance, heretofore granted to the contrary." And thus it came to pass, as Dr. Westcott strikingly puts it, that "by Cranmer's petition, by Cranwell's influence, and by Henry's authority, without any formal ecclesiastical decision, the book was given to the English people, which is the foundation of the text of our present Bible. From Matthew's Bible—itself a combination of the labours of Tyndale and Coverdale—all later revisions have been successively formed" (op. cit. p. 71).

Meanwhile the successful sale of Matthew's Bible, the private venture of the two printers Grafton and Whitchurch, was threatened by a rival edition published in 1539 in folio and authorized by the head of Thomas Cranmer, who was presented with the book by Richard Taverner as editor. This was, in fact, what would now be called "piracy," being Grafton's Matthew Bible revised by Taverner, a learned member of the Inner Temple and famous Greek scholar. He made many alterations in the Matthew Bible, characterized by critical acumen and a happy choice of strong and idiomatic expressions. He is, perhaps, the first purist among the Biblical translators, endeavouring, whenever possible, to substitute a word of native origin for the foreign expression of his predecessors. His revision seems, however, to have had little or no influence on subsequent translators, and was only once, in 1540, reprinted in its entirety. Quarto and octavo editions of the New Testament alone were published in the same year, 1539, as the original edition, and in the following year, 1540, the New Testament in duodecimo. The Old Testament was reprinted as part of a Bible in 1551, but no other editions are known than those named.

It will have been observed that the translations of Holy Scripture which had been printed during these years (1535-1539) were all made by private men and printed without any public authority. Some of them had indeed been set forth by the king's licence, but the object of this is shown by the above-quoted letter of Archbishop Cranmer to Cromwell, touching Matthew's Bible. It is "that the same may be sold and read of every person . . . until such time that we, the bishops, shall set forth a better translation, which I think will not be till a day after doomsday." This letter was written on the 4th of August 1537, and the impatient words at the end refer to an authorized version which had been projected several years before, and which was, in fact, at that very time in preparation, though not proceeded with quickly enough to satisfy Cranmer.

In the year 1539, Henry VIII. (Wilton's Concilia, iii. 737). This commission reported against the expediency of setting forth a vernacular translation until there was a more settled state of religious opinion, but states that the king "intended to provide that the Holy Scripture shall be, by great, learned and Catholic persons, translated into the English tongue if it shall then seem to His Grace convenient to be" (ib. 740). The Convocation of Canterbury refreshed the royal memory on the subject by petitioning the king on the 19th of December 1534 "that His Majesty would vouchsafe to decree, that the Scriptures should be translated into the vulgar tongue . . . and . . . delivered to the people according to their learning" (ibid. 779). The subject was again before Convocation in 1536, but the detailed history is lost to us—all that is known being that Cromwell had placed Coverdale at the head of the enterprise, and that the result was an entirely new revision, based on Matthew's Bible.6 Coverdale consulted in his revision the Latin version of the Old Testament with the Hebrew text by Sebastian Münster, the Vulgate and Erasmus's editions of the Greek text for the New Testament.

Concerning the printing of this authorized Bible more details are known. Cromwell had planned the work on a large scale, too large evidently for the resources of the English presses, for it was determined that the printing should be entrusted to Francis Regnault, a famous Paris printer. At the request of Henry VIII., a licence was granted to Regnault for this purpose and the work was to enter the press as quickly as possible, and was to be pulled and sold habitually in the event of being burnt—and conveyed types, printing-presses and workmen to England. Thus the volume which had been begun in Paris in 1538 was completed in London, the colophon stating that it was "Fynished in Apryll, Anno M.CCC.CCCXXX." It is a splendid folio Bible of the largest volume, and was distinguished from its predecessors by the name of The Great Bible. The title-page represents Henry VIII. giving the "Word of God" to Cromwell and Cranmer, who, in their order, distribute it to laymen and clerics, and describes the volume as "truly translated after the verye of the Hebrewe and Greke texts by ye dylygent labours of divers learned men, expert in the for-sayde tongues. Prynted by Rychard Grafton and Edward Whitchurth." "Certain godly annotations," which Coverdale promised in the Prologue, did not, however, appear in the first issue, nor in any of the following. This was the first of seven editions of this noble Bible which issued from the press during the years 1539-1541,—the second of them, that of 1540, called Cranmer's Bible from the fact that it contained a long Preface by Archbishop Cranmer, having the important addition "This is the Byble apoynted to the vs of the churches . . . on the title-page. Seventy years afterwards it assumed the form ever since known as the Authorized Version, but its Psalter is still embedded, without any alteration, in the Book of Common Prayer.

For the sake of comparison the following extracts from St. Matthew are given, according to the edition of 1539. (Matthew iii. 1-4.) In those days came John the Baptist, preaching in the wilderness of Jewry, saying, Repent ye, for the kingdom of heaven is at hand. For this is he, of whom it is written, The voice of one crying in the wilderness, Prepare ye the way of the Lord; make his paths straight. The whole John had hys garment of camelheere and A gyrdell of a skynne aboute his loynes. This is the Byble apoynted to the vs of the churches . . . on the title-page.

(Matthew vi. 9-13.) Our father which art in heaven, hallowed be thy name. Let thy kingdom come. Thy will be fulfilled, as well in earth, as it is in heuen. Geue vs this daye our daye bryd. Adam & Eve vs oure deters. And forge vs oure deters. And leade vs not into temptation: but deluyer vs from euyll. For thynke is the kyngdome & tye power, and the glorye for euer. Amen.

Meanwhile the closing years of Henry VIII.'s reign were characterized by restrictive measures as to the reading and use of the Bible. The Tyndale Version was prohibited by an act of 1540. The word "word" was retranslated as "read" or "thesis."
BIBLE, ENGLISH

parliament, 1543; at the same time it was enacted that all notes and marginal commentaries in other copies should be obliterated, and that "no woman (unless she be a noble or gentle woman), no artificers, apprentices, journeymen, servingmen, under the degree of yeomen . . . husbandmen or labourers" should read or use any part of the Bible under pain of fines and imprisonment. 1 In 1540 Coverdale's Bible was included in the preface to the Great Bible being the only translation not interdicted. During Edward VI.'s reign there was a brief respite, but with the accession of Mary the persecutions of the English Bible and its friends were renewed. Cranmer, who had been, as John Rogers, had done before him. Other prominent reformers, amongst them Coverdale, sought refuge in Geneva, the town of Calvin and Beza, where they employed their enforced leisure in planning and carrying out a new revision of the Bible. The first fruits of these labours was a New Testament issued in June 1557, with an introduction by Calvin, probably the work of William Whittingham. 2 The volume, in a convenient quarto size, printed in clear Roman type, and provided with marginal annotations, gained immediate popularity in England, where a Bible suited for household demands and long been needed. It was the first Bible which had the text divided into "verses" and sections according to the best editions in other languages. 3 Whittingham's enterprise was, however, soon superseded by an issue of the whole Bible, which appeared in 1560, the so-called Geneva Bible, popularly also known as the Breeches Bible, from its rendering of Gen. iii. 7, "They sewed fig leaves together and made themselves breeches." This edition was mainly due to the combined efforts of William Whittingham, Anthony Gilby and Thomas Sampson, and the expenses towards printing and publication were borne by members of the Geneva church. It was the first Bible to appear in the Old Testament a thorough and independent revision of the text of the Great Bible with the help of the Hebrew original, the Latin versions of Leo Judâ (1543), Pagninus (1528), Sebastian Munster (1534-1535), and the French versions of Olivetan. The New Testament consisted of Tyndale's latest text revised to a great extent in accordance with Beza's translation and commentary. The changes introduced by the Geneva translators were, as a rule, a great improvement, and the version received a ready welcome and immediate popularity, not only on account of its intrinsic merits, but because of its handy size, usually that of a small quarto, and of its being printed, like Whittingham's New Testament, in a readable Roman type instead of black letter. Like this earlier publication, it had the division of the chapters into verses, and a marginal commentary which proved a great attraction to the Puritans. The popularity of the Geneva Bible was so great that between 1560 and 1644 at least 140 editions of it were published, 4 and this in spite of its not being allowed for use in the churches.

In 1576 the New Testament of the Geneva Bible was again revised by Lawrence Tomson and provided with a new commentary mainly translated from Beza. It soon became popular and even replaced the Geneva New Testament in later editions of this Bible.

Some time after the accession of Queen Elizabeth an attempt was made to improve the authorized Great Bible, and in this way to challenge the ever growing popularity of the Calvinistic Geneva Bible. The initiative was taken by Archbishop Parker, about 1563-1565, who, according to Strype (Parker i. 444) "took upon him the labour to contrive and set the whole work a going . . . by sorting out the whole Bible into parcels . . . and distributing these parcels to able bishops and other learned men, to peruse and collate each the book or books allotted them . . . and they to add some short marginal notes for the illustration or correction of the text." The rules upon which they proceeded were these:—

1. "To follow the common English translation used in the churches, and not to recede from it, but where it varieth manifestly from the Hebrew or Greek original. 2. To use sections and divisions in the text as Pagninus in his translation useth, and for the verity of the Hebrew to follow the said Pagninus and Munster specially, and generally others learned in the tongues. 3. To make no bitter notes upon any text, or yet to set down any determination in places of controversy. 4. To note such chapters and places as contain matters of genealogies, or other such places not edifying, with some strike or note, that the reader may eschew them in his public reading." That all such words as sound in the old translation to any offence of lightness or obscenity be expressed with more convenient terms and phrases."

The work was pushed forward with energy, and on the 5th of October 1568 the volume was ready for publication. It was a magnificent folio, generally known as the Bishops' Bible, since not less than eight of these dignitaries took part in the revision. But the detached and piecemeal way in which the revision had been made, made it obvious that much effort was needed in the execution of the work. The different parts of the Bible vary considerably in merit, the alterations in the New Testament, for instance, showing freshness and vigour, whereas most of the changes introduced in the Old Testament have been condemned as "arbitrary and at variance with the exact sense of the Hebrew text" (Westcott, op. cit. p. 237). Several editions of the Bishops' Bible were afterwards published, but it is doubtful whether the ecclesiastical authorities in spite of repeated enactments (Cardwell, Synodalia, pp. 135, 123, 210, 292) ever succeeded in entirely enforcing its public use in the churches. It was the last attempt to make a truly satisfactory revision. But in the homes the Geneva version still maintained its supremacy. One thing is certain, that the book of Psalms of the new revision had fairly soon to give way before the well-known and smooth rendering of the Great Bible. In the second edition of the Bishops' Bible, 1572, the two texts were actually printed side by side; in all later editions except one (1585) the older Psalter alone remained.

From the time of Tyndale onwards the translation of the Scriptures into English had been more or less an outcome of the greed of the learned to cloth the Greek and the English with different languages. It was not until Queen Elizabeth's reign that members of the Romanist party found it expedient to translate the Bible into the vernacular "for the more speedily abolish- ing of a number of false and impious translations put forth by sundry sects, and for the better preservation or reclaim of many good soules endangered thereby" (Preface to the Rheims and Douay Version).

According to the title-page the New Testament was "translated faithfully into English out of the authentical Latin, according to the best corrected copies of the same, diligently conferred with the Greek and other editions in divers languages. In the English College of Rheims, 1582." The Old Testament had been "long since" completed, but "for lack of good means" (Preface to the New Testament), its appearance was delayed till 1609-1610, when it was published at Douai. The complete work, known as the Rheims and Douay Version, was reprinted in Rouen in 1635, and after a considerable time revised by Dr Challoner (1749-1750). The translation is really anonymous, but there seems to be little doubt that it was carried out by some of the Romanist refugees connected with the Seminary at Douai and the English colleges within the Rhine, the chief amongst them being Gregory Martin, William Allen, Richard Bristow and J. Reynolds. Like the Wyclifite Versions it is merely a secondary rendering from the Latin Vulgate, and it suffered from many of the defects which characterized these versions, extreme literalness, often stilted, ambiguous renderings, at times unintelligible except by a reference to the Latin original, as in Luke xxii. 18, "I will not drink of the generation of the vine," or Phil. ii. 7, "But he exanimated himself."
As further examples of this rendering we print the same passages from St Matthew:—

(Matthew iii. 1-4) And in those days came John the Baptist preaching in the desert of Judea, saying, "Repent ye, for the kingdom of heaven is at hand. For this is he that was spoken of by Esai the Prophet, saying, A voice of one crying in the desert, prepare ye the way of our Lord, make straight his paths. And the {5} John had his garment of camel's hair, & a girdle of a skin about his loines: and his meate was locustes & vvlde honie."

(Matthew vi. 9-13) Ovr Father which art in heaven, sanctifie be thy name. Let thy Kingdom come. Thy will be done, as in heaven, in earth also. Give vs to day our supersubstantial bread. And forgive vs our dettes, as we also forgive vs our debts, & leade vs not into temptation. But deliver vs from evil. Amen.

The strongly Latinized vocabulary of this version was not without its influence on the next great venture in English translations of the Bible, the Authorized Version.1

The English Bible, which is now recognized as the Authorized Version wherever the English language is spoken, is a revision of the Bishops' Bible, begun in 1604, and published in 1611. It arose incidentally out of a Conference between the High Church and the Low Church parties convened by James I. at Hampton Court Palace in January 1604, for the purpose of determining things pretended to be amiss in the church,2 and was originally proposed by Dr Reynolds, president of Corpus Christi College, Oxford, as the head of an English version of the Low Church party, and subsequently on the committee which revised the translation of the Prophets.

No real opposition was offered to the proposal, and the king cleverly sketched out on the moment a plan to be adopted. He "wished that some special pains should be taken in that behalf for one uniform translation—professing that he could never yet see a Bible well translated in English—and this to be done by the best learned in both the Universities, after them to be reviewed by the bishops and the chief learned men of the Church; from them to be presented to the privy council; and lastly to be ratified by his royal authority; and so this whole church to be bound unto it and none other."3 He also particularly desired that no notes should be added by way of comment in the margin, since some of those in the Genevan Bible appeared to him "very partial, untrue, sedicious and savouring too much of dangerous and traitorous conceits."

The appointment of the revisers was a work of much responsibility and labour, and five months elapsed before they were selected and their respective portions assigned to them; but the work of those who began the work, and who, with some changes in consequence of deaths, brought it to a happy conclusion, shows how large an amount of scholarship was enlisted. It includes Dr Andrews, afterwards bishop of Winchester, who was familiar with Hebrew, Chaldee, Syriac, Greek, Latin and at least ten other languages, while his knowledge of patristic literature was unrivalled; Dr Overall, regius professor of theology and afterwards bishop of Norwich; Bedwell, the greatest Arabic scholar of Europe; Sir Henry Savile, the most learned layman of his time; and, to say nothing of others well known to later generations, none who were then or afterwards professors of Hebrew or of Greek at Oxford or Cambridge. It is observable also that they were chosen without reference to party, at least as many of the Puritan clergy as of the opposite party being placed on the committees.

The following list is drawn up in such a way as to show the academical or other position which each of them occupied, and the particular part of the work on which they were engaged.

When this large body of scholars were set down to their task, an elaborate set of rules was drawn up for their guidance, which contained a scheme of revision as well as general directions for the execution of their work. This is one of the very few records that remain of their undertaking.4

1 See J. G. Carleton, The Part of Rheims in the Making of the English Bible (Oxford, 1902). 2 Compiled chiefly from the list found in Cardwell's Synopsis (ed. 1841), pp. 143-146. 3 A reprint from Burnet's Doc. Anns. ii. 106 ff., "who himself took his list from a copy belonging originally to Bishop Ravis." 4 The list is correct for the year 1604; cf. Westcott, op. cit. pp. 112 f.

4 Quoted from G. Burnet's Hist. of Reformation, ii. p. 368 (1661).
translation in hand, and to move and charge as many as being skilled in the tongues, to go and make such copies as should be fitted to the particular observations to the company either at Westminster, Cambridge or Oxford. (13) The directors in each company to the deans of Westminster and Chester for that place; and the king’s prebend of the west, or the prebend of the French or Greek churches, or the bishop of Bath,

Bible, Revised

1. A reprint of this edition has been published by the Clarendon Press (Oxford, 1833).
labour of deciding between different readings, which formed one of the most important duties of the New Testament company. But the advance in the study of Hebrew since the early part of the 17th century enabled them to give a more faithful translation of the received text. The value of their work is evident, especially in Job, Ecclesiastes and the prophetic books.

It is the work of the New Testament committee which has attracted most attention, whether for blame or praise. The critical resources at the disposal of scholars in 1611 were very meagre, and the few early manuscripts with which they were acquainted failed to receive the attention they deserved. The results of modern critical methods could not fail to make the incompleteness of the 'received text,' and of the 'Authorized Version,' which was based on it, obvious. It had long been the opinion of all competent scholars that a thorough revision was necessary. A proposal in favour of this course was made in Convocation in 1856, but it was not until fourteen years later that the committee was appointed to undertake the work. The revisers' first task was to reconstruct the Greek text, as the necessary foundation of their work. In this difficult duty they were no doubt influenced by Westcott and Hort's edition of the New Testament. These two scholars were members of the committee which prepared the Revised Version, and on the question of variant readings they tried to have the principle of the original text. The revisers were privately supplied with instalments of Westcott and Hort's text as their work required them. But it is scarcely necessary to say that the Revised Version is not the work of one or two scholars. Different schools of criticism were represented on the committee, and the most careful discussion took place before any decision was formed. Every precaution was taken to ensure that the version should represent the result of the best scholarship of the time, applied to the work before it with constant devotion and with the highest sense of responsibility. The changes in the Greek text of the New Testament, when compared with the textus receptus are numerous, but the contrast between the English versions of 1611 and 1881 are all the more striking because of the difference in the method of translation which was adopted. The revisers aimed at the most scrupulous faithfulness. They adopted the plan—deliberately rejected by the translators of 1611—of always using the same English word for the same Greek word. "They endeavoured to enable the English reader to follow the correspondence of the original with the closest exactness, to catch the solemn repetition of words and phrases, to mark the subtilities of expression, to feel even the strangeness of unusual forms of speech."

The revision of the New Testament was completed in 407 meetings, distributed over more than ten years. It was formally presented to Convocation on May 17, 1881. The revision of the Old Testament occupied 792 days, and was finished on June 20, 1884. The revised Apocrypha did not make its appearance until 1895.

The text of the Revised Version is printed in paragraphs, the old division of books into chapters and verses being retained for convenience of reference. By this arrangement the capricious divisions of some books is avoided. Various editions of the New Version have been published, the most complete being the edition of the whole Bible with marginal references. These references had their origin in the work of two small sub-committees of the revisers, but they received their present form at the hands of a specially appointed committee. The marginal references given in the original edition of the Authorized Version of 1611 have been retained as far as possible.

The work of the revisers was received without enthusiasm. It was too thorough for the majority of religious people. Partisans found that they had been played with their own texts. Ecclesiastical conservatives were scandalized by the freedom with which the traditional text was treated. The advocates of change were discontented with the hesitating acceptance which their principles had obtained. The most vulnerable side of the revision was that on which the mass of English readers thought itself capable of forming a judgment. The general effect of so many small alterations was to spoil the familiar sonorous style of the Authorized Version. The changes were freely denounced as equally petty and vexatious; they were, moreover, too often inconsistent with the avowed principles of the revisers. The methods of deciding readings and renderings by vote was not favourable to the existence of a literary character of the Version. A whole literature of criticism and apology made its appearance, and the achievement of so many years of patient labour seemed destined to perish in a storm of resentments. On the whole, the Revised Version weathered the storm more successfully than might have been expected. Its considerable excellence were better realized by students than stated by apologists. The hue and cry of the critics largely died away, and was replaced by a calmer and juster appreciation.

The work of the revisers has been sharply criticized from the standpoint of specialists in New Testament Greek. Dr. Rutherford stated the case briefly and pointedly in the preface to his translation of the Epistle to the Romans (London, 1900). He maintains that "the Greek of the New Testament may never be understood as classical Greek is understood," and accuses the revisers of distorting the meaning "by translating in accordance with Attic idiom phrases that convey in later Greek a wholly different sense, the sense which the earlier translators in happy ignorance had recognized that the context demanded."

The use of the new Version has become general. Familiarity has helped to stamp the revised readings as the "best rendering of scholarship, on the whole, has confirmed their readings. The Version has been publicly read in church services both in London and in the country. In Canterbury cathedral and Westminster Abbey it has definitely displaced the older Version. Bishops have acquiesced and congregations approved. It is no longer possible to maintain the plausible and damaging contention that the Revised Bible is ill suited for public use. The Upper House of the Convocation of Canterbury in May 1856 appointed a committee to consider the expediency of "permitting or encouraging" the use of the Revised Version in the public service of the Church. (H. H. II.)

BIBLIOGRAPHY.—The principal works dealing with the separate versions have been referred to in the text of the article. The following authorities may also be cited:

For the earlier history: J. Lewis, History of English Translations of the Bible (1818); the historical accounts prefixed to Bagster's issue of The English Hexapla and of Porshall and Madden's edition of the Wycliffe Versions (Oxford, 1850). These are all to a great extent antiquated, their errors being repeated in almost all subsequent accounts of the subject. The only trustworthy authority on the Anglo-Saxon Bible is A. S. Cook's "Introduction on Old English Translations of the Bible," in Biblical Quotations in Old English Prose-writers.

For the 14th and 15th centuries: See A. C. Pauw, The Bible in the Fourteenth Century.

For the early printed Bibles: H. Cotton, List of Editions of the Bible (1852); Rhemes and Douay (1885); F. Fry, The Bible by Covers (1891); Description of the Great Bible, 1539 (1865); Bibliographical Descriptions of the Editions of the New Testament (1878); N. Pocock, "On the Bishops' and Genevan Bibles." (Bibliographer, 1854); Primrose, Editions of the 16th Century Bibles (1888); John Wright, Early Bibles of America (1893).

BIBLE CHRISTIANS—BIBLE SOCIETIES

Ely Lectures on the Revised Version (London, 1882). The Revisers fully explained their principles and methods in the Preface. The American Committee of Revision issued an historical account of their work (New York, 1883). The case against the Revisers is ably stated in The Revision Revisited, by Dean Burgon (London, 1883). The literary defects of the Version are elaborately discussed by C. G. Washington. The case against the Revisers was also made in The Revised Version of the English Bible (1882), and Ecclesiastical English (London, 1886). See also Some Thoughts on the Textual Criticism of the New Testament, by G. Salmon, D.D. (London, 1897); Bishop Elliott’s Charge (1901). The Greek Text of the New Testament, previously accepted by the Revisers, was now printed for the Clarendon Press by Archdeacon Palmer (Oxford, 1881). Parallel editions of the Bible, showing both the Authorized and Revised versions, were published in 1886. In 1887 a “Two Version” edition, have been issued by one or both the University Presses. (A. C. P.; H. H. H.*)

BIBLE CHRISTIANS, one of the denominations now merged in the United Methodist Church (see United Methodists), so called because its early preachers appealed solely to the Bible in confirmation of their doctrines. The denomination arose in the agricultural districts and fishing villages of north Cornwall and Devon; a district only slightly influenced by John Wesley and his original preachers, who were personally. The founder was William O’Brien (afterwards Bryant), a Methodist lay preacher of Luxulian, Cornwall. Finding that the people had no evangelical preaching he began an itineracy to supply the need. The coastmen were expert smugglers and wreckers, the agriculturists were ignorant and drunken, the parish clergy were slothful, in many cases intertemperate, and largely given to fox-hunting. Only in a parish or two was there any approach to religious ministry. O’Brien commenced his labours in north Devon, and in 1815 a small society was formed at Lake Farm, Shebbear. The movement grew, and in 1818 the first annual conference was held at Launceston. There were present besides O’Brien one accepted minister—James Thorne—fourteen ministers on trial and fifteen women preachers, a class that was always conspicuous in the denomination. At that conference the work had spread from Ring’s Ash in Devon to Morrah, a lonely and desolate parish in west Cornwall. In 1820-1821 Kent, Northumberland, the Scilly and Norman (i.e. Channel) Islands appeared on the list of stations. Then came a serious break. In 1829 there was a severance between the larger part of the new body and O’Brien, who had claimed to be perpetual president, and to have all the original members of the society. He tried to establish a separate conference, but failed, and in 1836 there was a re-union. O’Brien left England for America, where he remained for the rest of his life, and his contingent (numbering 56 members and 4 ministers) returned to the original conference. The growth continued. In 1831 agents were sent to Canada and Prince Edward’s Island, in 1830 to South Australia, in 1835 to Victoria, in 1866 to Queensland, in 1877 to New Zealand and in 1885 to China, so that the original O’Brien tradition of fervid evangelism was amply maintained. On O’Brien’s departure, James Thorne, the first fully recognized minister, at whose father’s farm the connexion started, became its leader. Although reared as an ordinary farm lad, he proved to be a man of singular devotion and spiritual genius. He laid the foundations broadly in evangelism, finance, temperance and education, founding in the latter connexion a middle-class school at Shebbear, at which generations of ministers’ sons and numerous students for the ministry have been educated. James Thorne was five times president of the conference and fifteen times secretary. He died in 1872. In this period there was much persecution. Landowners refused sites, and in the Isle of Wight, Wight, the famous London Water Company attempts to quarry. The preachers were sometimes imprisoned and many times assaulted. The old Methodist body even excommunicated persons for attending “Bryanite” meetings. Partly co-operative with James Thorne and at his death independently, the Church was favoured with the influence of Frederick William Bourne. He was a minister for fifty-five years, and served the Bible Christians as editor, missionary treasurer, book steward and three times president of conference. With him will always be associated the name of Billy Bray, an illiterate but inimitable Cornish evangelist, a memoir of whom, written by Bourne, exerted a great influence in the religious life of the denomination.

In doctrine the Bible Christians did not differ from the other Methodists. In constitution they differed only slightly. There was a general conference, with full legislative power, and ability to hold and dispose of property, consisting of ministers and ministerial representatives meeting together. The local churches were grouped into circuits governed representatively by a quarterly conference. The quarterly and circuit meetings were in turn grouped into twelve districts, eleven in England and one in China. In 1906 the statistics showed 218 ministers, 32,549 members and 652 chapels, with 44,501 scholars in Sunday-schools. These figures include an unknown number of members in the China mission, and the first-fruits of two years’ labour amongst the Miao tribe. In the various colonial Methodist unions the Bible Christians have continued to be very active. In 1906 the total of 159 preachers, 14,925 members and 660 chapels. The community supported a regular regular periodical, the Bible Christian Magazine. Its members have been keen evangelists, trusting largely to “revivals” for their success, staunch Radicals in politics and total abstainers in temperance. The Bible Christians are to-day the greatest Methodist body in China.

The Reformation quickened men’s interest in the Scriptures to an extraordinary degree, so that, notwithstanding the adverse attitude adopted by the Roman Church at and after the council of Trent, the translation and circulation of the Bible were taken in hand with fresh zeal, and continued in more systematic fashion.

Thus, the Revised French Geneva Bible of 1588, which was issued in folio, quarto and octavo, and became a standard text, bears the following note on the verso of the title: “Les friez de cet ouvrage, imprimé en trois diverses formes en même temps, pour la commodité de ceux qui ont soin de l’hymnographie et de l’exécution de la liturgie, sont présentés dans des formes variées, d’abord par quelques gens de bien, qui n’ont cherché gagner pour leur paroisse, mais seulement de servir à Dieu et à son Église.” The Corporation for the Promoting and Propagating of the Gospel of Jesus Christ in London and its Branches (founded 1804) first issued the New Testament and the Bible as a whole (Cambridge, Mass., 1863—the earliest Bible printed in America), which John Eliot, one of the Pilgrim Fathers, translated into “the language of the Massachusetts Indians,” whom he evangelized. In Arnauld’s Defense (1669) of the famous Port Royal version of the New Testament in French (issued, 1667), he states that it had been printed in many forms and sizes, including very cheap editions for the poor, and goes on to describe how its circulation was promoted by “les sacrifices que s’imposaient les pieux solitaires pour faire participer les plus indigents au bienfait de leur entreprise. Dès que leur traduction fut approbée de Paris un grand nombre de coopteurs chargés de la vendre au prix de revient et même, dans certaines circonstances, à des prix réduits; et ils conservaient la dépense par des dons volontaires.” (E. Pétavel, La Bible en France, p. 57.)

To meet the cost of publishing the Finnish Bible in 1685, the editor, J. Gezelius, bishop of Abo, obtained an order from the Swedish government for the appropriation of certain corn-tithes, still known by the name of “Bryn-Tax.” This led, in 1684, to the foundation of the Society for the Publication of the Scriptures, the tsaar Alexander I. contributed 5000 roubles from his privy purse, and ordered that these corn-tithes should again be appropriated to this purpose for five years more. In 1701 a translation of the first ten books of the Old Testament of the Ethiopic Psalter, whose editor, H. Ludolf, writes in his preface: “Quamobrem nullam gratiam officium Christianae huic nationi a me praestari posse putavi, quam si Psalterium Aethiopicum, generibus non solum nostri temporum, sed et caro salis venditur, typi mandari, ejusque plurima exemplaria nomine Societatis Indicae in Habsburgis gratia distribuaveram.” In 1719 appeared the first of numerous editions of the French
New Testament, connected with the name of the Abbé de Barneville, a priest of the Oratory at Paris. Impressed by the popular ignorance of the contents of the Scriptures, he himself translated, or caused others to translate, the New Testament into French from the Vulgate, and formed an association to distribute copies systematically at low prices. The prefaces to his various editions contain details as to the methods of this association, and point out the utility of reading the Scriptures. (On this Société biblique catholique française see O. Douen, Histoire de la société biblique protestante de Paris, Paris, 1866, pp. 323–51.)

Christian missionaries to non-Christian lands have naturally been among the most skilful translators and the most assiduous distributors of the Bible. The earliest complete Arabic Bible was produced at Rome in 1671, by the Congregatio de Propaganda Fide. Protestant missionary societies have engaged energetically in the task not only of translating, but of printing and distributing the Scriptures. Thus the Society for Promoting Christian Knowledge (founded 1698), besides its other activities, has done much to cheapen and multiply copies of the Scriptures, not only in English and Welsh, but in many foreign languages. Early in the 18th century it printed editions in Arabic and Persian the first version of the Bible in Tajik and Telugu made by the Danish Lutheran missionaries whom it supported in south India. The earliest New Testament (1767) and Old Testament (1783–1801) in Gaelic were published by the Society in Scotland for Propagating Christian Knowledge (founded 1700). The S.P.C.K. now publishes versions of the Scriptures (either complete, or in part) in 38 different languages (without reckoning versions of the Prayer Book in 45 other languages); and during 1905–1906 the S.P.C.K. issued in English 116,126 Bibles and 17,793 New Testaments.

The Bible Societies are body organizations formed for the specific purpose of circulating the Scriptures, the Canstein Bible Institute (Bibelenanstalt), founded in 1710 at Halle in Saxony, by Karl Hildebrand, baron von Canstein (1667–1719), was associated with P. J. Spener and other leaders of Pietism in Germany. He invented a method of printing, perhaps somewhat akin to stereotyping—though the details are not clearly known,—whereby the Institute could produce Bibles and Testaments in Luther's version at a very low cost, and sell them, in small size, at prices equivalent to 10d. and 3d. per copy, respectively. In 1722 editions of the Scriptures were also issued in Bohemian and Polish. At Canstein's death he left the Institute to the care of his friend August Hermann Francke, founder in 1698 of the famous Weisenhaus (orphanage) at Halle. The Canstein Institute has issued some 6,000,000 copies of the Scriptures.

In England various Christian organizations, which arose out of the Evangelical movement in the 18th century, took part in the work. Among such may be mentioned the Society for Promoting Christian Knowledge among the Poor (1750); and the Society for the Support and Encouragement of Sunday Schools (1783). An institution was founded in 1780 under the name of the Bible Society, but as its sphere was restricted to soldiers and seamen the title was afterwards changed to the Naval and Military Bible Society. The first ship among whose crew it distributed the Scriptures was the "Royal George," which had 400 of this Society's Bibles on board when it foundered at Spithead on the 28th of August 1782. The French Bible Society, instituted in 1792, came to an end in 1803, owing to the Revolution.

The British and Foreign Bible Society.—In 1804 was founded in London the British and Foreign Bible Society, the most important association of its kind. It originated in a proposal made in 1802 by the Religious Tract Society, by the Rev. Thomas Charles of Bala, who found that his evangelistic and philanthropic labours in Wales were sorely hindered by the dearth of Welsh Bibles. His colleagues in the Religious Tract Society united with other earnest evangelical leaders to establish a new society, which should have for its sole object "to encourage a wider circulation of the Holy Scriptures, without note or comment." This simplicity of aim is combined with a catholicity of constitution which admits the co-operation of all persons interested in the society's object. The committee of management consists of thirty-six laymen, six of them being foreigners resident in or near London, while of the remaining thirty, half are members of the Church of England, and half are members of other Christian denominations.

Supported by representative Christian leaders, such as Granville Sharp, Zachary Macaulay, William Wilberforce, Charles Grant and Henry Thornton, with Lord Teignmouth, ex-governor-general of India, as its first president, and Dr Porteous, bishop of London, as its first vice-president, the society moved forward with a rapid progress. It spread throughout Great Britain, mainly by means of auxiliaries, i.e., local societies, affiliated but self-controlled, with subsidiary branches and associations (these last being often managed by women). Up to 1816–1817 the parent society had received from its auxiliaries altogether £420,000. This system continues to flourish. In 1905–1906 the society had about 5800 auxiliaries, branches and associations in England and Wales, and more than 2000 auxiliaries abroad, mainly in the British Colonies, many of which undertake vigorous social work, besides remitting contributions to London.

The society's advance was checked by several controversies. (a) Its fundamental law to circulate the Bible alone, without note or comment, was vehemently attacked by Bishop Marsh and other divines of the Church of England, who insisted that the Prayer Book was the only suitable Bible to accompany the New Testament. Another controversy related to the circulation—chiefly through affiliated societies on the continent—of Bibles containing the Deuterocanonical books of the Old Testament. It was contended that its fundamental law be fully and distinctly recognized as excluding the circulation "of those Books, or parts of Books, which are usually termed Apocrypha." This step, however, failed to satisfy many in the society, so in 1850 the society's constitution was altered so that it now provides that the Bible is "the Book in which the Bible is still in existence." (b) A fourth controversy arose out of the restrictive renderings of the term "baptize" and its cognate terms, adopted by William Carey and his colleagues in their famous "Serampore Versions," towards publishing which the society had contributed up to 1830 nearly £30,000. Protests from other Indian missionaries led the society to determine that it could circulate only such versions as gave neutral renderings for the terms in question. As a sequel, the Bible Translating and Publishing Society, founded in 1839 to issue versions embodying distinctively Baptist renderings.

By one of its original laws the British and Foreign Bible Society could not distribute no copies of the Scriptures in English, other than the King James's Version of 1611. In 1901 this law was widened to include the Revised English Version of 1881–1885.

From its foundation the society has successfully laboured to promote and improve the circulation of the Bible, and, in 1845, 20,000 copies of the old and new English Bible, or some part of it, had been printed in about fifty-five different tongues. By the year 1906 versions, more or less complete, had been published in more than 530 distinct languages and dialects, more than 300 of these translations. The work, which had been promoted by the society. Translations or revisions in scores of languages are still being carried on by companies of scholars and representative missionaries in different parts of the world, organized under the society's auspices and largely at its expense. New versions are made, wherever practicable, from the original Hebrew or Greek text; and the results thus obtained have a high philological value and interest. The society's interdenominational character has commonly secured—what could hardly otherwise have been attained—the acceptance of the same version by missions of different churches working side by side. The old principle of the Reformed Communion on such terms that, as a rule, the books distributed by the missions involve no charge on their funds. Except under special circumstances, the society does not undertake wholly foreign distribution, but provides complete editions at prices which the poorest can pay. On the whole it receives from sales about 40% of what it expends in preparing, printing and circulating the books.

In the year 1852 the society's circulation reached the unprecedented total of 5,977,453 copies, including 608,683 Bibles and 1,326,475 Testaments. Of the whole, 1,921,000 volumes were issued from the Bible Houses in London, and 4,056,432 circulated chiefly in England and the British colonies. The other main fields of distribution were as follows:—France, 203,000 copies; Central Europe, 679,000; Italy, 117,000; Spain and Portugal, 100,000; Russia, 120,000; Persia, 20,000; Burma and Ceylon, 768,000; Japan, 286,000; and China, 1,075,000 (most of these last being separate gospels).

The society spends £10,000 a year in grants to religious and philanthropic agencies at home. Outside the United Kingdom
it has its own agencies or secretaries in twenty-seven of the chief cities of the world, and maintains depots in 200 other centres. It employs 930 Christian colporteurs abroad, who sold in 1905-1906 over 2,250,000 volumes. It supports 670 native Christian Bible-women in the East, in connexion with forty different missionary organizations. The centenary festival in 1904 was celebrated with enthusiasm by the colporteurs abroad, who, after 18 years, had distributed one million copies of the Scriptures—all of which more than 78,000,000 were in English.

In Scotland, the Edinburgh Bible Society (1809), the Glasgow Bible Society (1812), and other Scottish auxiliaries, many of which had dissociated themselves from the British and Foreign Bible Society after 1826, were finally incorporated (1861) with the National Bible Society of Scotland, which has carried on vigorous work all over the world, especially in China. During 1905, with an income of £27,108, it issued 1,560,881 copies, 907,000 of which were circulated in China. Its total issues from 1861 to 1906 were 26,106,205 volumes.

In Ireland, the Hibernian Bible Society (originally known as the Dublin Bible Society) was founded in 1804 and in 1828 was federated with the Irish auxiliary, the Cork Bible Society, which was founded in 1814, and issued 601,159 copies of the Scriptures—of which more than 78,000,000 were in English.

In America the earliest Bible society was founded at Philadelphia in 1808. Six more societies—including those of New York and of Massachusetts—were formed during 1809, and other societies, auxiliaries and associations quickly followed. In 1816 a convention of delegates representing 31 of these institutions met at New York and established the American Bible Society, with Elias Boudinot as president. All kindred organizations in the states gradually became amalgamated with this national body, and the federation was completed in 1839 by the adhesion of the Philadelphia Society (which now changed its name to the Pennsylvania Bible Society). Not a few noteworthy versions of the Bible, such as those in Arabic, 15 dialects of Chinese, Armenian, and Zulu, and many American Indian, Philippine, and African languages have appeared under the auspices of the American Bible Society. Turkish, classical Chinese, and Korean versions have been made by the American and British societies jointly. The society's foreign agencies extend to China, Japan, Korea, the Turkish empire, Bulgaria, Egypt, Micronesia, Siam, Mexico, Central America, the South American republics, Cuba and the Philippines. In the year ending March 31st 1905 the income of the Society was $302,345, and it issued 2,153,028 copies of the Scriptures, one-half of which were sent to readers outside the United States. The total distribution effected by the American Bible Society and its federated societies had in 1900 exceeded 84,000,000 volumes, in over a hundred different languages.

AUTHORITIES.—Besides the published reports of the societies in question, the following works may be mentioned: J. Owen, History of the First Ten Years of the British and Foreign Bible Society (London, 1822), and History of the British and Foreign Bible Society (London, 1861); W. L. Bertram, Geschichte der Christenischen Bibelanstalt (Halle, 1862); E. Pétavel, La Bible en France (Paris, 1864); O. Donen, Histoire de la société biblique protestante de Paris (Paris, 1868); G. Borrow,
BIBLIOGRAPHY AND BIBLIOLOGY

**BIBLIOGRAPHY AND BIBLIOLOGY.** The word *bibliography* was used in post-classical Greek for the writing of books, and as late as 1761, in Fenning's *English Dictionary*, a bibliographer is defined as "one who writes or copies books." The transition from the meaning "a writing of books" to that of "a writing about books," was accomplished in France in the 18th century —witness the publication in 1763 of the *Bibliographie instructive* de Bure. In England the new meaning seems to have been popularized by the Rev. Thomas Fornagl Diéulin early in the 19th century, while Southey preferred the rival form *bibliology*, which is now hardly used. Present custom inclines to restrict the province of bibliography to printed books as opposed to manuscripts, and on the other hand recognizes as coming within its scope almost everything in which a book-loving antiquary can be interested, including the *Catalogue of the Printed Editions of Holy Scripture* (London, 1903, vol. i, 1908).

**Examination and Collation.** Books are submitted to examination in order to discover their origin, or to test statements concerning a book that would enable one to assert that they are perfect, and if perfect whether they are in their original condition or have been "made up" from other copies. The discovery of where, when and by whom a book, or fragment of a book, was printed, is the most difficult of these tasks, though as regards books printed in the 15th century it has been much facilitated by the numerous facsimiles enumerated under *Incunabula* (q.v.). In the article *Book* (q.v.) a sketch is given of the chief external characteristics of books in each century since the invention of printing. Familiarity with books of different ages and countries soon creates a series of general ideas as to dates and places by which any combination of these characteristics may be connected, and an experienced bibliographer, more especially if he knows something of the history of paper, will quickly narrow down the field of inquiry sufficiently to make special search possible.

As regards the regard of mis-statements in early books as to their place and origin, glaring piracies such as the Lyonese counterfeits of the octavo editions of the classics printed by Aldus at Venice, and the numerous unauthorized editions of works by Luther, professed to be printed at Wittenberg, have long ago been exposed. A different variety of the same kind of puzzle arises from the existence of numerous original editions with fictitious imprints. As early as 1490 a Brescia printer, in order to evade the privilege granted to Aldus, gave to an edition of Politian the spurious imprint "Florentiae," and in the 16th century many controversial books printed in England purported to have been issued in German towns, or with pleasure humour, "at Rome before the castle of S. Angel at the sign of S. Peter." Only a knowledge of the general characteristics which a book printed at such a place and such a time should possess will secure avoidance of these traps, but when suspicion has been aroused the whole story will often be found in such books as Weller's *Die marikirte Literatur der älteren und neueren Sprachen* (1856-1867), and *Die falschen und fälschlichen Druckbünde* (1864), Brunet's *Imprimeurs imaginaires et libraires supposés* (1860), de Broulliant's *La Liberté de la Presse en France; Histoire de Pierre du Marteau, imprimeur à Cologne*, &c. (1888); in the various bibliographies of Erotica and in Brunet's *Manuel de l'Amateur* and other handbooks for the use of collectors.

A special case of this problem of piracies and spurious imprints is that of the modern photograph. The type-setting of forgery of small books possessing a high commercial value, such as the early editions of the letter of Columbus announcing his discovery of the New World. Bad forgeries of this kind can be detected by the tendency of all photographic processes of reproduction to thicken letters and exaggerate every kind of defect, but the best of these imitations when printed on old paper require a specific knowledge of the originals and often cause great trouble. The type-facsimile forgeries are mostly of short pieces by Tennyson, George Eliot and A. C. Swinburne, printed (or supposed to have been printed—for it is doubtful if some of these forgeries ever had any originals) for circulation among friends. These trifes should never be purchased without a written guarantee.

When the edition to which a book belongs is known, further examination is needed to ascertain if it is perfect and in its original state. Where no standard collation is available, this can only be ascertained by a detailed examination of the quires or gatherings of which it is made up (see below). In the earliest books these are often very irregular. A large book was usually printed simultaneously in four or six sections on as many different sheets, and they are sometimes left to those which have been "completed" by dealers; hence many old books have been "made up" with leaves from other copies, or not infrequently from other editions. These meddling often defy detection, but proof of them may be found in differences in the height and colour of the paper, in the two corresponding leaves at either end of a folio quire both possessing a watermark, or in their wiremarks not corresponding, or (in very early books) by the ornamentation added by hand being in a different style.

When it has been ascertained that a copy contains the right number of leaves, the further question arises as to whether any of these have been supplied from other copies, or are in facsimile. Few collectors even now use this reason to refuse a book, but to ascertain if the ravages of time have left them to those which have been "completed" by dealers; hence many old books have been "made up" with leaves from other copies, or not infrequently from other editions. These meddlings often defy detection, but proof of them may be found in differences in the height and colour of the paper, in the two corresponding leaves at either end of a folio quire both possessing a watermark, or in their wiremarks not corresponding, or (in very early books) by the ornamentation added by hand being in a different style.

When it has been ascertained that a copy contains the right number of leaves, and that all these leaves are original, the last point to be settled is as to whether it differs in any respect from the standard collation. Owing to the extreme slowness of the presswork for the first two centuries after the invention of printing, there were more opportunities for making small corrections while an old book was being passed through the press than there are in the case of modern ones, and on the other hand the balls used for inking the type sometimes caught up words or individual letters and these were replaced by the compositors as best they could. The small variations in the text noticed in different copies of the First Folio edition of Shakespeare which are again of Milton's *Paradise Lost*, are probably to be explained by a mixture of these two causes. Where a serious error was discovered after a sheet had been printed off, the leaf on which it occurred was sometimes cut out and a new leaf (called a "cancel") printed to replace it and pasted on to the rest of the sheet. Variations between different copies of the first edition of Herrick's *Hesperides* which have puzzled all his editors are due to the presence of several of these. Lastly, a printer when he had printed part of a book might wish to increase the size of the edition, and the leuces already printed off would have to be reprinted, thus causing a combination of identical and different leaves in different copies. The famous 42-line Bible of c. 1455, variously attributed to Gutenberg and to Fust and Schoeffer, and the *Valerius Maximus* printed by Schoeffer in 1471, are instances of editions being thus enlarged while passing through the press. As each book was set up simultaneously on several different presses, the reprinted leaves occur at the beginning of each of the sections.

It should be mentioned that there are books of which it is difficult to find exact copies in exact condition. Either to quicken presswork or to comply with trade-regulations made it necessary for compositors in some books of which large
numbers were required, e.g. the Paraphrases of Erasmus, the First Prayer-book of Edward VI., and the "Songs and Sonnets to Totell's Misselday, each forme was set up two or more different times. The formes were then used at haphazard, and both at this stage and when the printed sheets came to be issued almost any number of different combinations might be made. The books named were all printed in the middle of the 16th century, but probably later instances could be produced.

Description.—The ideal towards which all bibliographical work should be directed is the provision in an accessible form of a standard description of a perfect copy of every book of literary, historical or typographical interest as it first issued from the press, and of all the variant issues and editions of it. When such standard descriptions shall have been made, adequately checked and printed, it will be possible to describe every book of old copy by a simple reference to them, with a statement of its differences, if any, and an insistence on the points bearing on the special object with which it is being re-described. Only in a few cases has any approach been made to a collection of such standard descriptions. One instance which may be cited is that of the entries of the 15th century books in the Repertorium Bibliographicum of Ludwig Hain (1826-1838), which the addition of an asterisk marks as having been examined by Hain himself in the copies in the Royal library at Munich. The high standard of all the 15th century entries (which were excluded from the measurements of blank leaves at the beginning or end) has been so well established, and the Repertorium is so widely known, that many catalogues of incunabula the short title of the book together with the number of Hain's entry has been usefully substituted for a long description. Books printed at Oxford up to 1640 can be equally well described by their short titles and a reference to Mr Falconer Madan's Early Oxford Press published in 1895. At present the number of works which can thus be taken as a standard is only small, owing partly to the greater and more accurate detail now demanded, partly to the absence of any systematic co-operation among librarians, and partly to the fact that the special work of the Librarian is only willing to pay for catalogues relating exclusively to its own collections. It may be hoped that through the foundation of bibliographical institutes more work of this kind may be done.

A standard description of any book must, as a rule, consist of the following sections, though in the case of works which have no typographical interest, some of the details may be advantageously omitted:—(a) A literal transcript of the title-page, also of the colophon, if any, and of any headings or other portions of the book serving to distinguish it from other issues; (b) Statements as to the size or form of the book, the gatherings or quires of which it is made up, with the total number of leaves, the measurement of an uncut copy or of the type-page, a note of the types in which different parts of the book are printed, and a reference to any trustworthy information already in print; (c) A statement of the literary contents of the book and of the points at which they respectively begin; (d) A note giving any additional information which may be needed.

(a) In transcribing the title-page and other parts of the book it is desirable not to omit intermediate words; if an omission is made it should be indicated by three dots placed close together. The punctuation should be put in after the printer has had a chance to examine it, since the printer is often either shrewd enough to suggest a considerable gain to indicate to the eye in what types the words transcribed are printed, i.e. whether in roman, gothic letter, or italic, and in each case whether in majuscules or minuscules ("upper or lower case"). To do this, however, adds greatly not only to the cost of printing, but also to the liability of error. If roman minuscules are used throughout, or for the text and italic for the imprint of colophon, the method of transliteration which the printer himself would have used should be adopted. Many of the best modern catalogues and bibliographies are disfigured by the occurrence in them of such forms as "qvine," "qveen," "urove," due to an older transliteration of the printed sheets, e.g. QVEEN, QOVEL, QVOEVE, as they occur on title-pages at a date when "V" was the majuscule form of both "v" and "u." If it is desirable to retain the V forms the words should be printed in majuscules only, and in these works as quine, queen, according to the practice of the old printers themselves.

A troublesome question often arises as to what notice should be taken of any drastic changes in the order of the works. We may only say that when any change by the printer is appropriate to the text and is not a misprint, the change will be noted. In all cases the printers will consult their happiness by indicating the misprint in some way, and the frequent use of (sic), more especially when printed in italics, will usually suffice. If a manuscript (i.e. something aside from a note at the end stating that the misprints in question occur in the original.

(b) The "size" of a book is a technical expression for the relation of the size of individual leaves to the size of the sheet on which they are printed, and the relation of the size of the sheet to the height of the sheet forming two pages, as is the case in an octavo, while the width is divided into six instead of four as in an quarto. As the later folios of the 16th century are of the same height as the double-leaf forming two pages, and the width of the sheet the height of three pages, consequently the wire-ends are horizontal (E. G. Duff, Early Printed Books, pp. 206-207).

(For further information on the size of a book, see The Transcripts of the original of which the book itself is a copy, and on the determination of the size of the paper used, see Hain's Repertorium Bibliographicum.)

(c) When a manuscript or early printed book was being prepared for binding, it was usual for the order in which the quires or gatherings were to be arranged to be indicated by signing them with the letters of the alphabet set in blocks in the lower margin of each page; the Latin, in which I stands for both I and J; V for both U and V; and there is no W. If more than twenty-three letters were needed, the combinations for the other letters were usually assigned in the way described above. The modern system of number signs has been dictated by the exigencies of modern practice for the convenience of collectors of first editions, and for the use of booksellers and bibliographers. It was evolved in the latter half of the 17th century, and has since been generally adopted as the standard system for numbering leaves. It is based on the ancient system of numbering quires, which was extended to gatherings and to the various stages of the production of a book. It is not, however, a system of numbering as such, but a means of referring to a specific leaf or text-page, and is therefore of the utmost usefulness to bibliographers, to booksellers, and to collectors of first editions. The modern system, however, is not a system of numbering as such, but a means of referring to a specific leaf or text-page, and is therefore of the utmost usefulness to bibliographers, to booksellers, and to collectors of first editions.

(d) Some bibliographers prefer to use double strokes to avoid confusion with the old-fashioned long commas. Others use a single stroke to indicate the space between two lines and increase the number of strokes where the space left is wider than this. 

Some bibliographers prefer to use double strokes to avoid confusion with the old-fashioned long commas. Others use a single stroke to indicate the space between two lines and increase the number of strokes where the space left is wider than this.
the sequence of watermarked and un-watermarked leaves, if carefully worked out, will mostly reveal the "make-up" of the successive gatherings.

After the size and sequence of the gatherings has been stated, the total number of leaves should be noted, with a mention of any succession of them given in the book. Any discrepancy between this stated number and that assigned to the book (or its main gatherings total as separately counted of course points to an error, and the reckonings must be repeated till they tally. Errors in the printed enumeration of the leaves are common, and must therefore be carefully pointed out in detail. When reference has to be made to a particular page of an old book, the printed signatures offer the readiest means, an index number placed below the letter indicates the position of the leaf in the gathering and the addition of "recto" or "verso" marking the upper or under page of the leaf. Thus "X4 recto" (some bibliographers prefer the rather clumsier form: "X 4 recto") stands for the first page of the fourth leaf of the first gathering of X. Where letters are not numbered the leaf-number may be given, the letters "a" and "b" above the numeral taking the place of "recto" and "verso" (leaf 99). Where some leaves of a book are numbered and others not, if the reference is to the printed enumeration this should be stated.

Printed leaf number is found as early as 1470, and became common about ten years later. Printed pagination did not become standard till nearly the middle of the 16th century. The foregoing details are all directed to showing which leaves of a book would be printed by the same pull of the press, how it was made up from beginning to end, and how instructions in any copy may be deciphered.

To give little or no indication of the disposition of the book. In the case of modern editions this may be done by adding one of the trade epithets, post, foolscap, crown, etc., to the name of the book. For the previous qualification of the leaf, of which the paper and measurement (see Paper). As, however, these measurements are not easily remembered, it is better to give the actual measurements in inches or millimetres of a page of an uncut copy. In old books uncut copies are not easy found, and it is usually unwise to give the measurement in millimetres of the printed portion of the page (technically called the "type-page").

The character of the type (roman, gothic or italic) is next mentioned, and whether the text is set in roman or type-page size. If in type-page size, the number of founts used may be given (see INCUNABULA). Finally a reference to any authoritative description already printed completes this portion of the entry. Thus the description of the collation of the first-edited book printed at Augsburg, Meditaciones of S. Bonae ventura, printed by Günther Zainer in 1489, should read: Folio (a², b³-d³, e⁴, h²) 72 leaves. Type-page (1) 202 X 120 mm.; 35 lines. Type 1 (gothic letter). Hain 3557.

(3) While many books, and this especially true of early ones, contain little or nothing beyond the bare text of a well-known work, others are well provided, not only with commentaries which are almost constantly included in them, or with which the editor himself often wrote), but also with dedicatory letters, prefaces, complimentary verses, indexes and other accessories, the presence of which is desirable to indicate. In these cases it is often helpful to know the entirety of the book, or at least the parts in which they occur, not the leaves or pages on which each begins. Thus in the first edition (1590) of the first three books of Spenser's Faerie Queen, it is useful to know that the dedications of the Poet and the Ladies are in the Court; and "Faults escaped in the print"; Qiv, fifteen other sonnets.

Some bibliographers prefer to reverse the order of notation, (title, verse, dedication, index, etc.), and no principle is sacrificed in doing so, therefore the order suggested usually works out the more neatly.

Enumeration and Arrangement.—In the 18th and early 19th centuries there was a tendency, especially among French writers, to exaggerate the scope of bibliography, on the ground that it was the duty of the bibliographer to appraise the value of all the books in a library, and to indicate the exact place which each would occupy in the logical development of all the literature based on a previous classification of all knowledge. Bibliographers are now more modest. They recognize that the classification of human knowledge is a question for philosophers and men of science, that the knowledge of chemistry and of its history needed to make a good bibliography of chemistry is altogether extrinsic to bibliography itself; that all, in fact, which bibliography can pretend is to suggest certain general principles of arrangement and to point out to some extent how they may be applied. These principles are neither universal nor fixed. To illustrate the history of printing, books may be arranged according to the places and printing-houses where they were produced. For the glorification of a province or county, they are sometimes grouped under the places where their authors were born or resided. For special purposes, they may be arranged according to the language or dialect in which they are written. But, speaking generally, the choice for a basis of arrangement rests between the alphabetical order of authors and titles, a chronological order according to date of publication, a "logical" or alphabetical order according to subjects, and consideration of the combination of these methods. In exercising the choice the essential requisite is a really clear idea of the use to which the bibliography, when made, is to be put. If its chief object be to give detailed information about individual books, a strictly alphabetical arrangement "by authors and titles" (i.e. by the names of authors in their alphabetical order, and the titles of their books in alphabetical sequence under the names) will be the most useful, because it enables the student to obtain the information he seeks with the greatest ease. But while such an alphabetical arrangement offers the speediest access to individual entries, it has no other main title than being the most informative. In deciding how each author has written. If it is desired to illustrate the history and development of a subject, or the literary biography of an author, the books should be entered chronologically. If direction in reading is to be given, this can best be offered by a subject-index, in which the subjects are arranged alphabetically for speedy reference, and the books chronological under the subject, so that the newest are always at the end. Lastly if the object is to show how far the whole field has been covered and what gaps remain to be filled, a class catalogue arranged according to what are considered the logical subdivisions of the subject has its advantages. It is important, however, to remember that, if the bulk of the bibliography is very large, a principle of arrangement which would be clear and useful on a small scale may be lost in the quantity of pages over which it extends. An arrangement which cannot be quickly grasped, whatever satisfaction it may give its author, is useless to readers, the measure of its utility being the work condition of the alphabetical index to which those who cannot carry a complicated "logical" arrangement in their heads are obliged to turn, in the first instance, to find what they want. It should be added here that an index which necessitates a preliminary reference to a key or index rests under grave suspicion, and needs some clear counterbalancing gain to justify the loss of time which it entails. The main classification should always be that which will be most immediately useful to readers of the books. To throw light on the history of a subject and to indicate how far the field is covered are honourable objects for compilers, but should mostly be held subordinate to practical use. It is noteworthy also that they may often be better forwarded by means of an index or table than by the main arrangement. The history of Hain's Repertoria und Indizes is a classic example of an alphabetical arrangement of authors and titles some 16,000 books printed in the 15th century, is a good example of this. For sixty-five years it was of the utmost use for its accurate descriptions of individual books, but threw practically no light on the history of printing. In 1891 Dr Konrad Burger published an appendix to it containing an Index of Printers, since greatly enlarged in his index to Dr Copinger's Supplement to Hain (1902). The form of the index enables each printer's work to be seen at a glance, and the imprints given to the study of the history of printing was very great. But if the book had originally been arranged under Printers instead of Authors, it would have been far more difficult to use; its literary value would have been halved, and the record of the output of each press, now instantly
visible, would have been obscured by the fuller entries causing it to extend over many pages.

The Bibliography of Bibliography.—The zeal of students of early printing has provided the material for an almost exhaustive list (see Incunabula) of the books printed in the 15th century still extant. Of those printed in the years 1501–1535 there is a tentative enumeration in the continuation of Panzer's Annales Typographici (1803), and materials are gradually being collected for improving and extending this. But the projects once formed for a universal bibliography have dwindled in proportion as the costs have increased. For some obscure reason, and because to such a work are the printed catalogue of the library of the British Museum, and that of the Bibliothèque Nationale at Paris, now in progress. Of books of great rarity unrepresented in these catalogues a fairly sufficient record exists in Brunet's Manuel du libraire, the bibliographical collections of Mr W. C. Hazlitt, the Bibliographer's Manual by Lowüdes, and the other bibliographical works enumerated in the article on book-collecting (q.v.). When a universal bibliography was recognized as an impossibility, patriotism suggested the compilation of national bibliographies, and the Bibliotheca Britannica of Robert Wart (Edinburgh, 1810) is an extraordinary example of what the zeal of a single man could accomplish in this direction. Quérard's La France littéraire (Paris, 1827–1839), while it gives fuller titles, is much less comprehensive, embracing mainly books of the 18th and early 19th centuries, and only such of these as appeared to the compiler to be written by "savants, historiens, et gens de lettres." In the works of Heinsius (Allgemeines Bücherlexikon, 1700–1815, Leipzig, 1812–1817), and Kayser (Bücherlexikon, 1750, et al., Leipzig, 1834, etc.) Germany possesses a fine record of her output of books during the last two centuries, and since the organization of the book-trade, contemporary lists of books, with résumés and indexes issued at intervals, exist for most European countries. For the period before these became of importance in England much bibliographical material has been collected in the Catalogues of English Books printed up to the end of the year 1640, issued by the British Museum in 1884, by the John Rylands library, Manchester, in 1865, and by the University Library, Cambridge, in 1900–1906. A similar record of the rich English collections in the Bodleian library, Oxford, remains a great desideratum. While these substitutes for a universal author catalogue have gradually been provided, titles similar to those of a universal subject catalogue have been made in the form of innumerable special bibliographies compiled by students or bookmen interested in special subjects or departments of literature. The most important of these are enumerated in the bibliographical notes appended to articles in this Encyclopaedia, but many attempts have been made to compile separate catalogues of them.

The most recent of these bibliographies of bibliographies naturally take over all that is of any value in their predecessors, and it may suffice therefore to make special mention of the following:—Bibliotheca bibliographica. Kritisches Verzeichnis der das Gesamtgebiet der Bibliographie betreffenden Literatur des In- und Auslandes, in systematischem Ordnung bearbeitet von Dr Julius Petrat. Mit alphabetischen Namen und Sachregister (Leipzig, 1866), Svo. pp. xii. 940; Manuel de bibliographie générale, par Henri Stein (Paris, 1898), Svo. pp. xii. 896; à propos de la bibliothèque des monarques de la France et de la Belgique (Paris, 1891), 12mo. pp. x. 623; A Register of National Bibliography. With a selection of the chief bibliographical works and articles printed in other countries, by W. P. Courtney (London, 1901), Svo. pp. xii. 246.

It should also be noted that the List of Books of Reference in the Reading-Room of the British Museum, first published in 1889, and the Subject-index of the Modern Works added to the Library of the British Museum in 1895 (supplements published every five years), include entries of a vast number of bibliographical works, and that an eclectic list, with a valuable bibliography of works on sources and methods, will be found in Professor Norman's Sources and Methods of Bibliography (Edinburgh, 1900). (A. W. Po.)

BIBLIOMANCY (from the Gr. Bibliomānikē, a book, and μανία, prophecy), a form of divination (q.v.) by means of the Bible or other books. The method employed is to open the Bible haphazard and be guided by the first verse which catches the eye. Among the Greeks and Romans the practice was known under the name of sortes Homericæ or sortes Virgilianæ, the books consulted being those of Homer or Virgil.

BIBRAC'TE, an ancient Gaulish town, the modern Mont Beuvray, near Autun in France. Here, on a hilltop 2500 ft. above sea-level, excavation has revealed a vast area of 330 acres, girt with a stone and wood rampart 3 m. long, and containing the remains of dwelling-houses, a temple of Bibractis, and the workshops of iron and bronze workers and enamellers. It was the capital of the Aedui in the time of Julius Caesar. Later on Augustus removed the inhabitants to his new town Augustodunum (Autun), to destroy the free native traditions. Another far more obscure town in Gaul, near Reims, also bore the name.

See Bulliot, Foulies de Beuvray: Décéthe de, Oppidum de Bibracte: also references in ed. Aedui.

BIBULUS, a surname of the Roman gens Calpurnia. The best-known of those who bore it was Marcus Calpurnius Bibulus, consul with Julius Caesar, 59 B.C. He was the candidate put forward by the aristocratical party in opposition to L. Lucciccius, who was of the party of Caesar; and bribery was freely used, with the approval of even the rigid Cato (Suetonius, Caesar, 9), who got his election, but he proved no match for his able colleague. He made an attempt to oppose the agrarian law introduced by Caesar for distributing the lands of Campania, but was overpowered and even personally ill-treated by the mob. After making vain complaints in the senate, he shut himself up in his own house during the remaining eight months of his consulship, taking no part in public business beyond fulminating edicts against Caesar's proceedings, which only provoked an attack upon his house by a mob of Caesar's partisans. His conduct gave rise to the jest, that Julius and Caesar were consuls during that year. When the relations of Pompey and Caesar became strained, Bibulus supported Pompey (Plutarch, Cat. Minor, 41) and joined in proposing his election as sole consul (52 B.C.). Next year he went to Syria as proconsul and claimed credit for a victory gained by one of his officers over the Parthians, before his own arrival in the province. After the expiration of his term of office, Pompey gave him command of his fleet in the Ionian Sea. He proved himself utterly incapable; his chief exploit was the burning of thirty transports on their return from Epirus whether they had succeeded in conveying Caesar and some troops from Brundisium. He died two years later (48) of fatigue and overwork. Further, Caesar, Bell. Civ. iii. 5-18; Dio Cassius xii. 48). Although not a man of great importance, Bibulus showed great persistency as the enemy of Caesar. Cicero says of him that he was no orator, but a careful writer. By his wife Porcia, daughter of Cato, afterwards married to Brutus, he had three sons. The two eldest were murdered in Egypt by some of the soldiery of Gabinus; the youngest, Lucius Calpurnius Bibulus, fought on the side of the republic at the battle of Philippi, but surrendered to Antony soon afterwards, and was by him appointed to the command of his fleet. He died (about 32) while governor of Syria under Augustus. He wrote a short memoir of his step-father Brutus, which was published after his death by Plutarch (Appian, B.C. iv. 136; Plutarch, Brutus, 13. 23).

BICE (from Fr. bis, a word of doubtful origin, meaning dark-coloured), a term erroneously applied in English to particular shades of green or blue pigments from the French terms vert bis and azur bis, dark green or blue. These colours are generally prepared from basic copper carbonates, but sometimes from ultramarine and other pigments.

BICESTER, a market town in the伍oodstock parliamentary division of Oxfordshire, England, 13 m. N.E. of Chipping Norton, a branch of the London & North-Western railway. Pop. of urban district (1901) 3023. It lies near the northern edge of the flat open plain of Ot Moor, in a pastoral country. The church of St Eadburg, the virgin of Aylesbury, is cruciform, with a western tower, and contains examples of Norman and each succeeding style. There is, moreover, in the nave a single rude angular arch considered to be Saxon. Incorporated with a farm-house, scanty Perpendicular remains are seen of an
Augustinian priory founded at the close of the 12th century. Bicestor has considerable agricultural trade and a brewing industry. It is a latifundium, and the hunting of deer is a pastime.

The next object was vast, the area extending from the diocese of Chartres to the south (Dorchester), west, north-east and east.

Bicestor (Bernestre, Burencestre, Bisitier), according to the Domescum survey, was held by Robert d'Oilly. In 1182 Gilbert Basset founded here an Augustinian priory, which from then until its dissolution in 1538 became the centre of the industrial life and development of the town.

In 1796, William Basset had attained the age of eight-and-twenty, and was appointed physician to the Hôtel Dieu, a situation which opened an immense field to his ardent spirit of inquiry. In the investigation of diseases he pursued the same method of observation and experiment which had characterized his researches in physiology. He learned to study them at the bedside of his patients, and by accurate dissection of their bodies after death. He engaged in a series of examinations, with a view to ascertain the changes induced in the various organs of the diseased body, and the length of time they had continued.

It was completed on the same plan by his pupils, M. F. R. Buisson (1776-1803) and P. J. Roux (1780-1854).

into a solution containing potassium sulphate. After the calcium salt has settled, the potassium chromate solution is added to the calcium salt, and the precipitate is made to crystallize. It forms large triclinic prisms of specific gravity 2.6-2.7, which are moderately soluble in cold water and readily soluble in hot water. The solution is strongly acid in reaction and is very poisonous. Potassium chromate, being anhydrous, is produced extensively in the dyeing industry.

Village, f. See VILLAGE.

Hydrogen...—Potassium bichromate is an unstable, hygroscopic salt, readily formed by the action of hydrogen peroxide on potassium dichromate. It is used in photography and in the preparation of bichromates and potassium dichromate.

BICYCLE (from prefix bi-, twice, and Gr. ποδός, a foot). The modern bicycle, as developed from the old velocipede (see CYCLINE), consists essentially of two wheels placed one behind the other and mounted on a frame which carries a saddle for the rider. Between the wheels is a crank-axle which the rider drives by means of the cranks and pedals, and its motion is transmitted to the rear wheel by a chain which passes over two chain wheels, one fixed on the crank-axle and the other on the hub of the rear wheel, or, in the chainless bicycle, by a tubular shaft and two pairs of bevel-wheels. The rear wheel is usually so arranged that it can turn, when the bicycle is running by its own momentum, independently of the chain and pedals, whilst the motion of the pedal and cranks is transmitted to the driving wheel. The front, or steering wheel, is mounted in a fork having its two upper ends brazed into the "crown," to which also the lower end of the steering tube is brazed. The steering tube is mounted by ball bearings in the socket tube, which forms the forward portion of the rear-frame.

The highest quality of materials and the most accurate workmanship are required to produce a first-class bicycle. Steel of 75 to 100 tons per sq. in. tensile strength is used in chains, spokes, etc. In balls and ball-races, hardness without brittleness, and homogeneity are of primary importance. Broken balls, or even traces of wear in bearings, are now seldom heard of in a first-class bicycle. The process of case-hardening, whereby an extremely hard outer skin is combined with a tough interior, has been brought to a high degree of perfection, and is applied to many parts of the bicycle, particularly chains, free-wheels and toothed-wheel variable speed gears. Interchangeability of parts is secured by working to the smallest possible limits of error of workmanship.

Interchangeability of parts is secured by working to the smallest possible limits of error of workmanship.

Frame.—Fig. 1 represents a road-racer. A full roadster would have the wheels a little higher relatively to the saddle, and would be provided with mud-guards, free-wheel and sometimes a gear-case and variable speed gear. Fig. 2 shows a lady’s bicycle with gear-case and dress-guard. The rear frame of the "diamond" type (fig. 1) is subjected to very small stresses due to vertical load. The front fork and steering post are subject to bending moment due to the horizontal force from the ground in the direction of the slope. A slight amount of elasticity in the front fork adds considerably to the comfort in riding over rough roads. When the brake is applied lightly to the front wheel, the reaction from the ground falls more closely along the axis of the front fork, and the bending moment at the crown is diminished. If the front brake is applied harder the reaction from the ground at f may pass through the crown, in which case the bending moment at the crown is zero. Still harder application of the brake causes a bending moment in the opposite direction. In fig. 1 the axes of the top and bottom tubes of the rear frame are produced to meet at a.

Help (London, 1816), which has been translated into many European languages, and Christian Psalmsody (London, 1833), a collection of over 700 hymns, which forms the basis of the Hymn-Gear in parson (London, 1870), compiled by his son, E. H. Bickersteth, bishop of Exeter (1890). He was active in promoting the Evangelical Alliance of 1845, strongly opposed the Tractarian Movement, and was one of the founders of the Irish Church Missions, and Parker, Societies.

Edward Bickersteth (1814–1892), dean of Lichfield, was his nephew, and Edward Bickersteth (1850–1897), bishop of South Tokyo, his grandson.

If the reaction from the ground is in the direction $\alpha$, the top and bottom tubes are subjected to pure compressive and tensile stresses respectively. When no brake pressure is applied a bending moment due to the overhang $\alpha$ is superimposed on these tubes. Thus a short socket head with top tube sloping downwards towards the head gives a stronger frame than a horizontal top tube. The steering axis $ef$ is arranged so as to cut the ground at $f$, a little in front of the point of contact $d$ of the wheel with the ground, giving a slight caster action, and making steering possible without use of the handle-bar. The rake of the steering head (that is the angle between $ef$ and $bd$) and the set of the fork (that is the displacement of the wheel centre from the axis $ef$) may be varied within tolerably large limits without much affecting the easy steering properties of the bicycle. The transverse stresses on the rear frame due to the action of pedalling are more severe than those due to the vertical load. The pedal pressure is applied at a considerable distance from the central plane of the bicycle, and the pedal pin, giving a slight caster action, and making steering possible without is transmitted by the ball bearings to the frame. The downtube from the seat lug to the crank-bracket and the bottom tube from the foot centre to the steering socket tube to the crank-bracket are made fairly stout to resist this bending moment. Further, the pull of the chain causes a transverse bending moment in the plane of the chain-stays, which must be stiff enough under heavy pedal pressure.

The tubular portions of the frame are made of weldless cold-drawn steel tube. The junctions or lugs are usually of malleable cast iron, bored to fit the outside of the tube, the final union being effected by brazing. In very light bicycles the tubes are kept thin, 22 or 24 W.G. (028 in. or 022 in. thickness) at the middle, and are strengthened at the ends by internal liners. Or butt-ended tubes are employed, the tubes being drawn thicker at the ends than in the middle. The steering post and fork sides especially should be thus strengthened at their junction with the crown. Some of the best makers use sheet steel stampings instead of cast lugs, greater lightness and strength being secured, and in some cases the sheet steel lugs are inside the tubes, so that the joints are all flush on the outside. The front fork blades are best made of sheet steel stamped to shape and with the edges brazed together to form a hollow tube. The sheet steel that can be thus employed has a much higher elastic limit than a weldless steel tube.

Bearings.—Ball bearings are universally used. Each row of balls runs between two ball-races of hardened steel, one on the stationary member, the other on the rotating member. The outer is called the "cup," and the inner the "cone." One of the four ball-races is adjustable axially so that the bearing may run without any shake. The ball-races are often made of separate pieces of steel, but the crank-axe usually has the cones formed integral with it, the necessary hardness being obtained by case-hardening. According as the two cups face outwards or inwards the bearing is said to have outward or inward cups, and according as the adjustable ball race is the cone or cup, the bearing is said to be cone-adjusting or cup-adjusting. Fig. 3 shows a ball-bearing hub with outward cups. The hub-shell $H$ is turned out of mild steel, and the cups $C$ are forced into the ends of the hub-shell and soldered thereto. A thin washer $W$ is then spun into the end, for the purpose of retaining oil, and a thin internal tube $T$ unites the two cups, and guides the oil fed in at the middle of the hub to the balls. The projecting flanges $S$ are for the attachment of the tangent spokes used to build the hub into the wheel. The spindle $A$ has the two cones screwed on it, one against a shoulder, the other $C$ adjustable. The spindle ends are passed through the back-fork ends and are then adjusted in position by the chain-tension adjusters. After adjustment the nuts $N$ clamp the spindle securely between the fork-ends. The chain-wheel or free-wheel clutch is screwed on the end of the hub-shell, with a right-hand thread. The chain being at the right-hand side of the bicycle (as the rider is seated) the driving pull of the chain tends to screw the chain-wheel tight against the shoulder. A locking-ring $R$ with a left-hand thread, screwed tight against the chain-wheel, prevents the latter from being unscrewed by back-pedalling. With a free-wheel clutch screwed on the hub, the locking-ring may be omitted.

Fig. 4 shows one end of the cup-adjusting hub, with inward bearings. The cones are formed of one piece with the spindles, and the adjusting cup $C$ is screwed on the end of the hub shell, and locked in position by the screwed locking-ring $R$. The figure also illustrates a divided spindle for facilitating the removal of the tire for repair when required without disturbing the wheel, bearings, chain or gear-case. The chain side of the hub-spindle, not shown in the figure, is secured to the frame in the usual way; on the left side the spindle $S$ projects very little beyond the adjusting cup. A distance washer $W$ is placed between the end of the spindle $S$ and the fork-end $F$. A detachable screw-pin, or the foot-end $F$, passes through the chain-adjusting draw-bolt $B$, the fork-end $F$, and the distance washer $W$, and is screwed into the end of the spindle $S$, the hexagon head of the detachable pin drawing all the parts securely together. On unscrewing the detachable pin, the distance washer $W$ drops out of place, leaving a clear space for removing the tire without disturbing any other part.

The inward-cups bearing retains more oil than the other form. The pressure on a ball being normal to the surface of contact with the ball race, and each ball touching two ball races, the two points of contact must be in line with the centre of the ball. All the lines of pressure on the balls of a row meet at a point $f$ on the axis of the spindle. The distance between the two points $f$ (fig. 5) may be called the virtual length of the bearing. Other things being equal, the outward-cups bearing has a greater virtual length than the inward-cups bearing. In hubs and pedal where the actual distance between the two rows of balls is sufficient, this point is of little importance. At the crank-axe bearing, however, where the pedal pressure which produces pressure on the axe bearings is applied at a considerable overhang beyond the ball-races, the greater virtual length of the outward-cups is an advantage.

Fig. 5 shows diagrammatically the usual form of crank-axe bearing which has inward-cups and is cup-adjusting. The end of the bracket is split and the cup after adjustment is clamped in position by the clamping screw $S$. The usual mode of fastening the cranks to the axe is by means of round cotters $C$ with a flat surface at a slight angle to the axis, thus forming a wedge, which is driven in tight. The small end of the cotter projects through the crank, and is secured by a cotter pin, which is held in place by a nut.

The chain-wheel at the crank-axe is usually detachably fastened to the right-hand crank.
The Rudge-Whitworth crank-bracket has outward cups and is cup-adjusting. The cranks are cotterless. Fig. 6 is a sectional view of the right crank and chain-wheel set. The fastening of the right crank and chain-wheel is by multiple grooves and teeth, this fastening being better dynamically than the cotter type.

**Pedals.**—The pedal consists of a central body, on which the foot of the rider rests, mounted by ball-bearings on a pedal-pin, which is secured to the end of the crank and turns with it. The pedal body is made in many forms, but usually the bearing-cups are surrounded with rubber blocks, or serrated plates (rat-trap pedals), on which the foot of the rider rests. Cone adjustment is most used. The fastening of the pedal pin to the crank is best effected by screwing it up against a shoulder, the right and left crank eyes being tapped with right and left hand screws respectively. With this arrangement, if the pedal pin screw is a slack fit in the crank eye, the pressure on the pedal tends to screw it up against the shoulder.

**Wheels.**—Bicycle and tricycle wheels are made on the "suspension" principle, the spokes being of high-tensile steel wire, screwed up to a certain initial tension, thus putting a circumferential compression on the rim. In the "articulated" wheel, the width of the spokes is in compression, and the rim is under tension. The rims, which are made to a section suitable for pneumatic tires (see Text), may be of sheet steel or of cast aluminium wire, or may be made in one piece, either without joint or joined by brazing or riveting. Wood rims are used on racing bicycles, but in England are not popular for roadster bicycles. Holes are drilled at or near the central plane of the rim for the spokes, which can rest on the outer surface of the rim and shanks projecting through the rim towards the hub. The spoke ends are screwed to fit the nipples. The shank of the nipple has a square cut on its outside surface by which it can be screwed up. The spoke flanges on the hub are placed far apart and the spread of the spokes gives the wheel lateral stability. Tangential rigidity under driving and braking is obtained by the spokes to the hub tangentially (figs. 1, 5, and 2). The hub fastening of the spokes is simply obtained by forming a hook and head on the spoke end, and passing it through a hole in the hub flange. The best spokes are battered at the ends, i.e., made of larger diameter than at the middle, to allow for screwing at one end and the hook bend at the other.

**Chains.**—There are two widely used types of chains. The "block" chain (fig. 7) consists of a series of central blocks connected by side plates. The "roller" chain (fig. 8) consists of a series of outside and inside links. The roller chain is made up of two steel side plates P united by two shouldered rivets R. The inside links B consists of two side plates P united by two tubular pieces T, which form bushes for the rivets R and rivets for the roller L. The rivets, bushes and rollers are case-hardened. Roller chains for cycles are made in two pitches, \( \frac{1}{8} \) in. and \( \frac{1}{4} \) in., and in widths from \( \frac{3}{8} \) in. to \( 1 \) in. between the side plates of the inside links. The weight of 4 ft. length (96 links) of \( \frac{1}{8} \) in. pitch \( \frac{3}{8} \) in. wide roller chain, which is the commonest size, and under working load is about 2000 lb. In a block chain the ends of the blocks engage with the teeth of the chain-wheels, and the same surfaces continually coming into contact, the wear may become excessive, especially when exposed to mud and grit. In the roller chain the outer surfaces of the rollers engage with the teeth of the chain-wheels, and during the engagement and disengagement may roll slightly on the tubular rivets. If the place of contact of the roller and tubular rivet is not directly exposed to the dust and grit from the road, the rollers therefore serve the double purpose of (1) transmitting the working load of the parts to a pair of surfaces under better conditions as regards lubrication, and (2) of the outside surface of the roller for the next engagement with the chain-wheel. The durability of roller chains is thus much greater than that of block chains, under the usual conditions of cycling.

**Chain-wheels.**—The pitch line of the chain-wheel is polygonal (fig. 9), \( a, b, c, d \) being centres of adjacent joints of the chain when lying in contact with the wheel. The pitch of the chain-wheel, relative to the chain-wheel as it enters on 10 and leaves the chain-wheel, is evidently the curve \( a_0, a_1, a_2, a_3 \), made up of a series of the circular arcs having centres \( d, c, b, a, e \), respectively. Similarly for the path \( a_0, a_1, a_2 \) for the adjacent joint of the chain.

The fullest possible form of the tooth is that between the two parallel curves, of radii less by an amount equal to the radius of the roller, as indicated in fig. 9. But since it is neither necessary nor desirable that the roller should roll along the whole length of the tooth, the radii of curvature of the tooth outline may be less than shown in fig. 9. A good arrangement of tooth form is shown in fig. 9. (a) When the pitch surface of the chain-wheel a does not transmit motion with constant speed-ratio of the shafts. The variation of speed related to the rectangular axes having centres \( a, b, c, e \) respectively. With links of equal pitch is approximately inversely proportional to the square of the number of teeth in the smaller chain-wheel, as shown in the table annexed, in which the percentage variation is maximum speed-ratio—minimum speed-ratio \( \times 100 \), average speed-ratio

The rollers as they come in contact with the chain-wheel strike it with a speed proportional to the angular speed of the chain-wheel and to the pitch of the chain, causing a certain amount of noise.

**Chain Adjustment.**—To keep the chain running at correct tension, it is necessary to have some adjustment of the distance between the crank-side and hub. This is obtained either by an eccentric adjustment at the crank-bracket, an eccentric adjustment at the hub-spindle or by draw-bolts at the fork-ends, the last method being most common.

**Gear-case.**—The modern roller chain by makers of repu is so durable that the necessity for a gear-case is not so great as when chains were of inferior quality. But if the bicycle is to require the highest possible gear-case and attention a gear-case should be fitted. The Sunbeam gear-case is built into the frame and is oil-retaining, and the chain, chain-wheels, free-wheel and two-speed gear are continually lubricated by an oil-bath. A detachable gear-case is not always by oil-retaining, but serves to exclude grit and mud from the chain.

**Gear and Crank-length.**—The "gear" of a bicycle is given by the formula \( D/n \) where \( D \) is the diameter of the driving-wheel in inches, \( n \) is the numbers of teeth on the crank-axle and crank-wheels respectively. At each revolution of the crank-axle, the bicycle is moved forward a distance equal to the circumference of the driving-wheel \( \pi D \), and the velocity is indicated by the number of revolutions per minute. If \( D \) is the diameter driving-wheel, \( 18 \) teeth on the hub-chain-wheel, \( 45 \) teeth on the crank-axle, the bicycle is geared to \( 70 \) in. The usual crank-length is \( 64 \) to \( 74 \) in. Cranks of \( 73, 8 \) and 9 in. length can be had, but require a bicycle of special design. The gear should be roughly proportional to the crank-length. The gear 10 times the crank-length is a good proportion for an average rider.

**Free-wheel.**—A free-wheel clutch transmits the drive in one direction only, allowing the pedals to remain at rest at the will of the rider, while the bicycle runs on. With a free-wheel, chain breakages are reduced or nearly eliminated, as should the chain get accidentally caught in the free-wheel comes into play. There are three principal types of free-wheel clutches—roller, ratchet and friction cone. The roller type was the earliest in use, but has fallen into disfavour. A sectional view of a ball-bearing ratchet free-wheel, with the cover relative, is shown in fig. 11. The ring on which the three claws and springs are carried is screwed on the end of the hub; the chain-wheel is combined with an inner ratchet wheel and is mounted by two rows of ball bearings on the pawl ring. The friction cone type of free-wheel clutch is usually combined with a brake.
inside the hub, the whole combination being termed a coaster hub. Fig. 12 shows a sectional view of the Eadie two-speed coaster, in which the free-wheel clutch and brake are combined with a two-speed gear. The free-wheel clutch action is as follows: A forward pressure of the pedals turns the cone externally through the cone H in the internally threaded cone F, the latter being thus forced to the right into engagement with the cup J which is screwed to the hub-shell, thus forming a friction driving clutch. The pedals being held stationary the driving cone H is stationary, and the hub running on the ball bearings G, the cone F travels towards the left until released from the cup J, when it also remains at rest. In this type of free-wheel clutch it is essential that there be little or no friction between the screwed surfaces of H and F, else on beginning to pedal, the cone F may remain stationary relative to the driving cone H, and no engagement between F and J may take place. If F be prevented from turning faster than the hub-shell, as is sometimes done by a light spring between the two, the engagement of the friction clutch must take place as soon as the pedals being continued sets up the required movement of the lever K, and applies the brake.

Two-speed Gears.—The effort required to propel a bicycle varies greatly, according to the conditions of road surface, gradient up or down hill, wind against or behind. To meet these variable conditions a variable speed-gear is an advantage. The action of the human motor is, however, so entirely different from that of a mechanical motor that it is easy, without practical experience, to over-estimate the value of a variable speed gear. Probably from 60 to 75 miles an hour, is not insurmountable, provided the conditions are favourable. For those who have not cultivated the art of quick pedalling the useful range of gear under favourable conditions may be as great as to say 50 to 100. The gear ratio of a two-speed gear is the ratio of the high to the low gear. The most suitable gear-ratio for any rider will depend upon his personal physique and the nature of the country in which he rides. For a middle-aged average physique a gear-ratio of 125:100 is suitable, for those of weaker physique the gear-ratio may with advantage be greater, say 137 5:100; while for road racing it may be smaller, say 117:100. With a three-speed gear the low and high gears should be chosen respectively below and above the single gear which the rider and the driver consider the middle gear being about the same as the rider's usual single gear. All the variable speed gears at present made consist of toothed wheel mechanism either at the hub or crank-bracket, and nearly all are based on the same epicyclic train of toothed wheels. At one speed there is no relative motion of the toothed wheels, the whole mechanism revolving as one solid piece; this is called the "normal" speed. At the other speed one part of the mechanism is held stationary and the driven part revolves faster or slower than the driver, according as the gearing is up or down. In some two-speed gears the normal is the high speed, in others the low. In expressing the gear-ratio, the normal speed will be denoted by 100. At the normal gear there is of course no additional friction. The type of two-speed gear used practically settles whether the normal gear is at high or low speed. It seems best, other things being equal, to have the low speed the normal gear, as then the conditions are worst. If the high speed is at normal gear, then at low speed the chain-wheels and the speed two-speed gear gears down; which is, to say the least, a roundabout transmission.

Fig. 13 is a sectional view of the Sunbeam two-speed gear which is arranged at the crank-axe, and clearly shows the relative displacement of the toothed wheel mechanism to nearly all cycle speed gears. The chain-wheel is fixed to the annular wheel A; the planet carrier C is fixed to the crank; and when the sun-wheel D is held stationary, the chain-wheel is driven faster than the cranks. When the sun-wheel D is released, the planet carrier C drives the annular wheel A by the ratchet free-wheel clutch; the part thus revolves as a solid piece, and gives the normal low speed. The gear-ratio is 133:130.

Fig. 14 is a sectional view of the "Hub" two-speed gear, the chain-wheel or free-wheel clutch being omitted. Thus the annular wheel is the driver, and the planet carrier is part of the hub-shell. When the central pinion is held stationary the hub is driven at a less speed than the chain-wheel; the gear-ratio is 100:75 in the Fagan two-speed gear, shown combined with the Eadie coaster hub in fig. 12, the sun-wheel B can be moved laterally by the striking gear, as to engage with the chain-wheel centre C, this the annular wheel is the driver, and the four planet pinions D are mounted on the driving cone H. Thus the gear gives a reduction of speed, the gear-ratio being 100:75.
The Sturmey-Archer three-speed hub (fig. 15) has gear-ratios 125 : 100 : 80. In the high gear position the epicyclic toothed wheels are to the extreme left position. The chain speed is increased by a free-wheel on a drive-ring, with which the ends of the spindles of the planet wheels engage at high gear. The sun-wheel, not shown in the figure, is held stationary, and the annular wheel engages with a ring screwed to the hub-shaft, by means of keys engaging in notches. The hub is thus driven at a higher speed than the chain-wheel. For normal gear, the striking gear draws the internal mechanism of the hub towards a central position, compressing a spring, disengaging the sun-wheel, and locking the drive-ring hub and annular wheel together. At low gear, the internal mechanism is drawn to the right-hand side, where the planet carrier engages with the plate of the hub by means of keys, the sun-wheel and annular wheel is still engaged with the drive-ring, and the sun-wheel is again locked to the spindle. The hub is thus driven at a lower speed.

**Tandem Bicycles.**—The weight of a roadster tandem is about the same as, or a trifle less than, that of two single roadster bicycles, but the frictional resistance of the mechanism, the rolling resistance of the tires, and the air resistance at a given speed are much less than twice the values for a single bicycle. Consequently, much higher speeds are attained on the level, and free-wheeling downhill is much faster. On the other hand for riding up hill on a moderate gradient, the effort required is about the same as on a single, while on very steep gradients the tandem is at a slight disadvantage. For the full enjoyment of tandem riding, therefore, a two-speed gear is a necessity, while a three-speed gear is better. In the Raleigh tandem (fig. 16) the frame design is such that it can be ridden by two ladies, and the strength and rigidity is sufficient for two heavy-weight riders. The steering and control of the brakes are done by the front rider. Connected steering is employed in some tandems, allowing the rear rider to steer if necessary. For two expert tandem riders, connected steering is slightly more practicable than fixed handle grips for the rear rider, but on the other hand, divided control may lead to disaster at a critical moment. Most passengers on a tandem with connected steering unconsciously give the steering a bias in one direction or the other, putting a nervous strain on the steersman which becomes almost intolerable towards the end of a long ride.

**Motor Bicycles.**—Fig. 17 shows a touring motor bicycle, fitted with luggage carrier and stand, the latter for supporting the bicycle while at rest. The average speed of a motor bicycle being much greater than that of a pedal bicycle the stresses on the frame due to moving over rough roads are greater. This necessitates greater strength and weight in all parts—frame, wheels and tires. To take this increased weight up steep gradients requires increased engine power. The weight of a touring motor bicycle may be from 150 to 200 lb. The drive is usually by a V belt of leather, or of canvas and rubber, or by chain of V type. The engine speed at maximum power is from 1500 to 2000 revolutions a minute, and the belt gears down in a ratio varying between 1:4 and 1:6 according to the cylinder capacity of the engine. The possibility of the belt slipping slightly is conducive to smoothness of drive; chain-driving, except in combination with a slipping clutch, is too harsh. The principal defect of the belt drive is that the belt stretches, and on coming to a steep hill may have to be tightened before the bicycle can be driven up. The control of the speed and power of the engine is effected by the throttle, extra air valve and spark advance, the

**BIDA**

BIDA, a town and administrative district in the British protectorate of Northern Nigeria. Bida town, situated in 9° 5' N., 6° E., 25 m. N. by E. of Muraji on the Niger, is the capital of the province of Nupe. It was founded in 1859 when Fula rule was established in Nupe, is walled and of considerable size. In 1909 it was connected by railway with Zaria, 40 m. S.E., the river terminus of the Northern Nigeria railway. The inhabitants, mostly Hausa, carry on an extensive trade and are especially noted for their embossed brass and copper work. The Bida goblets, in which brass and copper are beautifully blended, are of extremely elegant design. The town also boasts a glass factory. The preparation of indigo and the dyeing of cloths are other flourishing industries. The streets are planted with huge shade-trees, so that as Bida is approached it looks like a forest. In 1897 there was a two-days' fight outside the walls of Bida between the forces of the emir of Nupe and those of the Royal Niger Company, ending in the defeat of the Fula army (mostly cavalry). The victory was not followed at the time by a British occupation, and the defeated king returned after the withdrawal of the company's troops and re-established himself upon the throne. In 1900 he allied himself with other hostile chiefs and adopted an openly antagonistic attitude to the British government. In 1901 it became necessary for British troops to march on Bida. The emir fled, without fighting, to Kano. Another emir was appointed in his place, and the province of Nupe was placed under British administrative control. Since that date the town has been peaceful and very prosperous. A mission school has been established, and is attended by the sons of the emir and of the principal chiefs, who are desirous of learning to read and write English. The administrative district of Bida includes the town and is the western division of the province of Nupe (q.v.). (See also Nigeria: History.)
BIDDEFORD, a city of York county, Maine, U.S.A., on the Saco river, opposite Saco, and on the Atlantic Ocean, 13 m. S.W. of Portland. Pop. (1890) 14,443; (1900) 16,145, of whom 7,149 were foreign-born (mostly French Canadians); (census, 1910) 17,079. Biddeford is served by the Boston & Maine railway, and is connected by electric lines with Portland and with Old Orchard Beach, a popular summer resort north of the Saco river. The climate and the scenery in and about Biddeford attract many tourists and there are two resorts, Biddeford Pool and Fortune Rocks within the municipal limits; but the city is chiefly a manufacturing centre (third in rank among the cities of the state in 1905)—good-water-power being furnished by the river—and cotton goods, foundry and machine shop products and lumber are the principal products, the first being by far the most important. The value of the factory products increased from $5,475,254 in 1900 to $6,998,725 in 1905, or 27%. There are large quarries of granite of excellent quality. A permanent settlement was established on both sides of the river about 1630 under the leadership of Richard Viles (1596-1652) and was named Saco. In 1718 the present name was adopted. In 1762 that portion of Biddeford which lay east of the river was incorporated as the town of Pepperellborough, for which name Saco was substituted in 1805. Biddeford was incorporated as a city in 1855.

BIDDER, GEORGE PARKER (1806-1879), English engineer, was born at Moreton Hampstead, in Devonshire, on the 14th of June 1806. From a very early age he manifested an extraordinary natural aptitude for calculation, which induced his father, who was a stone-mason, to exhibit him a "calculating board." In Engineering School his talent was turned to profitable account, but his general education was in danger of being completely neglected. Interest, however, was taken in him by some of those who happened to witness his performances, among them being Sir John Herschel, and it was arranged that he should be sent to school in Camberwell. There he did not remain long, being removed by his father, who wished to exhibit him again, but he was saved from this misfortune and enabled to attend classes at Edinburgh University, largely through the kindness of Sir Henry Jardine, to whom he subsequently showed his gratitude by founding a "Jardine Bursary" at the University. On leaving college (1824) he received a post in the ordnance survey, but gradually drifted into engineering work. In 1834 Robert Stephenson, whose acquaintance he had made in Edinburgh, offered him an appointment on the London & Birmingham railway, and in the succeeding year or two he began to assist George Stephenson in his parliamentary work, which at that time included schemes for railways between London and Brighton and between Manchester and Rugby via the Potteries. In this way he was introduced to engineering and parliamentary practice at a period of great activity which saw the establishment of the main features and principles that have since governed English railway construction. He is said to have been the best witness that ever entered a committee-room. He was quick to discover and take advantage of the weak points in an opponent's case, and his powers of mental calculation frequently stood him in good stead, as when, for example, an apparently casual glance at the plans of a railway enabled him to point out errors in the engineering data that were sufficient to secure rejection of the scheme to which he was opposed. In consequence there was scarcely an engineering proposal of any importance brought before parliament in connexion with which his services were not secured by one party or the other.

On the constructive side of his profession he was also busily occupied. In 1837 he was engaged with R. Stephenson in building the Blackwall railway, and it was he who designed the peculiar method of disconnecting a carriage at each station while the rest of the train went on without stopping, which was employed in the early days of that line when it was worked by means of a cable. Another series of railways with which he had much to do were those in the eastern counties which afterwards became the Great Eastern system. He also advised on the construction of the Belgian railways; with R. Stephenson he made the first railway in Norway, from Christiania to Eidsvold; he was engineer-in-chief of the Danish railways; and he was largely concerned with railways in India, where he strongly and successfully opposed break of gauge on through-routes. But though he sometimes spoke of himself as a mere "railway-engineer," he was in reality very much more; there was indeed no branch of engineering in which he did not take an interest, as was shown by the multiplicity with which for half a century he attended the weekly meetings of the Institution of Civil Engineers, of which he was elected president in 1860. He was one of the first to recognize the value of the electric telegraph. That invention was in its infancy when, in 1837, jointly with R. Stephenson he recommended its introduction on a portion of the London & Birmingham and on the Blackwall lines, while three years later he advised that it should be adopted to facilitate the working of the single line between Norwich and Yarmouth. He was also one of the founders of the Electric Telegraph Company, which enabled the public generally to enjoy the benefits of Nizam's railways; in his hydraulic engineering, he was the designer of the Victoria Docks (London), being responsible not only for their construction, but also for what was regarded by some people at the time as the foolish idea of utilizing the Essex marshes for dock accommodation on a large scale. His advice was frequently sought by the government on points both of naval and military engineering. He died at Dartmouth on the 28th of September 1878.

His son, GEORGE PARKER BIDDER, Junr. (1836-1869), who inherited much of his father's calculating power, was a successful parliamentary counsel and an authority on cryptography.

BIDDERY, or BIDR (an Indian word, from Bedar or Bidar, a town in the Nizam's Dominions), an alloy of copper, lead, tin and zinc used in making various articles and ornaments which are inlaid with gold and silver.

BIDDING-PRAYER (O. Eng. biddan, to pray, cf. Ger. beten), the formula of prayer or exhortation to prayer said in England before the sermon in cathedrals, at university sermons, in the Inns of Court and elsewhere on special occasions. Such formulæ are found in the ancient Greek liturgies, e.g. that of St Cyril of Jerusalem, and in the Gallican liturgy, and in the pre-Reformation liturgies of England. The form varies, but in all the characteristic feature is that the minister tells the people what to pray for. Thus in England in the 16th century it took the form of a direction to the people what to remember in "bidding their beads." In course of time the word "bid" in the sense of "pray" became obsolete and was confused with "bid" in the sense of "command" (from O. Eng. beodan, to offer, present, and hence to announce, or command; cf. Ger. bieten, to offer, gebieten, to command), and the bidding-prayer has come practically to mean the exhortation itself. A form of exhortation which "preachers and ministers shall move the people to join with them in prayer" is given in the 55th canon of the Church of England (1663).

BIDDLE, JOHN (1615-1662), frequently called the father of English Unitarianism, was born on the 14th of January 1615, at Wotton-under-Edge, in Gloucestershire. He was educated at the grammar school of his native town and at Magdalen Hall, Oxford. He graduated B.A. in 1638 and proceeded M.A. in 1641, and was then appointed to the mastership of the free school in the city of Gloucester, where he was much esteemed for his diligence in his profession, serenity of manners and sanctity of life. He also diligently prosecuted theological studies, and the results he arrived at were of such a nature as to draw down upon him the reprobation of the civic authorities. A treacherous friend obtained the manuscript of his Twelve Arguments drawn out of Scripture, wherein the commonly received opinion touching the deity of the Holy Spirit is clearly and fully refuted; and in December 1645 he was summoned before the parliamentary committee then sitting at Gloucester. By them he was committed to prison, though he was at the time labouring under a dangerous fever. He was released on bail after a short imprisonment, but was in July 1647 called before parliament, which
desired to inquire into his views. After tedious proceedings, during which Sir Henry Vane befriended him, Biddle was committed to custody and his Twelve Arguments, which he had now published, was ordered by parliament to be seized and burned by the yeomen. Notwithstanding this, the ordinance of the 2nd of May 1648, visiting denial of the doctrine of the Trinity with death, Biddle issued two tracts, one a Confession of Faith touching the Holy Trinity, and the other The Testimonies of Irenaeus, &c., concerning the one God and the Persons of the Trinity (1648). These were suppressed by government, and the Westminster assembly of divines eagerly pressed for the passing of an act by which heretics like Biddle could be put to death. This, however, was resisted by the army, and by many of the Independent parliamentarians; and after the death of the king, Biddle was allowed to reside in Staffordshire, one of his vassals. He engaged in preaching and in literary work, particularly an edition of the Septuagint, published by Roger Daniel. In February 1652 the general act of oblivion gave him complete freedom, and his adherents soon began to meet regularly for worship on Sundays. They were called Biddellians, or Socinians, or Unitarians, the name which has now become associated with their opinions. Biddle was not left long in peace. He translated some Socinian books, among others the Life of Socinus, and published two catechisms which excited a fear of indulgence. He was summoned before the parliament in December 1652 and imprisoned. The dissolution of that body again set him at liberty for a short time, but he was presently brought up for some expressions used by him in a discussion with John Griffin, an illiterate Baptist pastor, who invoked the law against his superior opponent. He was put upon trial, and was only rescued by Cromwell, who sent him (October 1655) out of the way to one of the Scilly Islands, allowed him 100 crowns a year, and in 1658, on the solicitation of many friends, released him. For a few years he lived and taught quietly in the country, but returning to London he was in June 1662 again arrested. When released by a habeas corpus, he was at once committed to prison, where, fever, caused by the pestilential atmosphere, carried him off on the 22nd of September 1662.

BIDDE, NICHOLAS (1786-1844), American financier, was born in Philadelphia on the 8th of January 1786. He was the nephew of a naval officer, Captain Nicholas Biddle (1750-1778), who lost his life while fighting on the American side, during the War of American Independence. After almost finishing the prescribed course at the university of Pennsylvania, he went to Princeton, where he graduated with high honors in 1802. During 1804-1805 he was the secretary of John Armstrong, minister to France, and then of James Monroe, minister to Great Britain. After his return to America he practised law for several years in Philadelphia. He was an associate editor of Dennie's Portfolio, to which he contributed both prose and verse, and, with much literary skill, prepared for the press from the explorers' own journals a History of the Expedition under the Command of Captains Lewis and Clark (1814). He was a prominent member of the Pennsylvania House of Representatives in 1810-1811 and of the Senate in 1814-1817, and in 1817 was appointed Mgr. Biddle by President Madison. He became one of the five governors of the Bank of the United States. In 1819 he replaced Langdon Cheves as its president. In general he followed a conservative policy and showed marked ability in the management of the bank, but during President Andrew Jackson's warfare upon that institution, his character and his policy were violently assailed by the president and his followers. The bank's national charter lapsed in 1836, but it was immediately chartered by Pennsylvania as the "Bank of the United States, of Pennsylvania"; and Biddle remained president until 1839, two years before the bank failed. As president of the board of trustees appointed for the purpose, he took a prominent part in the establishment of Girard College, in accordance with the will of Stephen Girard (q.v.). He died in Philadelphia on the 27th of February 1844.

His son, CHARLES JOHN BIDDLE (1810-1873), served in the Mexican War as a captain of infantry, earning the brevet of major at Chapultepec; practised law in Philadelphia; was a representative in Congress in 1861-1865; was long editor-in-chief of the Philadelphia Age; and published "The Case of Major Gillen," a Reply to a Report of the Statement of it in Lord Mahon's History of England," and the Memoirs of the Historical Society of Pennsylvania (1858).

The best account of Nicholas Biddle's administration of the bank may be found in an excellent work, by Ralph C. H. Catterall, The Second Bank of the United States (Chicago, 1903).

BIDEFORD, a seaport, market town and municipal borough in the Barnstaple parliamentary division of Devonshire, England, 91 m. S.W. of Barnstaple. Pop. (1901) 8754. It is served by the London and South Western Railway, and by the Westward Ho & Appledore railways. It is picturesquely situated on land rising from the banks of the river Torridge, 3 m. above its junction with the estuary of the Taw. Many of the houses are built with timber framework in Elizabethan style, and the two parts of the town are united by a bridge of 24 arches, originally erected in the 14th century, when the revenue of certain lands was set apart for its upkeep. The church of St Mary, with the exception of the tower, is a modern reconstruction. A stone chancel screen and a Norman font are also preserved. Industries include the manufacture of leather goods, sails, ropes and linen, and iron founding. The annual market takes place about 15 ft. of water at high tide, but is dry at low tide. Anchorage and a coarse poster's clay are found near the town. The borough is under a mayor, 4 aldermen and 12 councillors. Area, 3308 acres.

Bideford (Bedford, Byfordy, Budeford, Bytheford) is not mentioned in pre-Conquest records, but according to Domesday it rendered geld for three hides to the king. From the time of the Conquest down to the 18th century, Bideford remained in the possession of the Grenville family, and it first appears as a borough in an undated charter (probably of the reign of Edward I.) from Richard de Greville, confirming a charter from his grandfather, Richard de Grenville, fixing the rent and services due from the burgesses and granting them liberties similar to those in use at Brest and a market every Monday. Another charter, dated 1271, confirms to Richard de Grenville and his heirs a market every Monday and five days' fair yearly at the feast of St Margaret (20th of July). In 1573 Elizabeth granted a charter creating Bideford a free borough corporate, with a common council consisting of a mayor, 5 aldermen and 7 chief burgesses, together with a recorder, town-clerk and 2 sergeants-at-mace. This charter also granted the Tuesday market, which is still held, and three annual fairs in February, July and November (now discontinued). A later grant of 1596 confirmed this and also granted to the mayor, burgesses, guildmen and 12 common councillors. In the 16th century Sir Richard Grenville, the famous Virginian settler, did much to stimulate the commercial development of Bideford, which long maintained a very busy and extensive trade with America, Spain and the Mediterranean ports. The import of tobacco from Maryland and Virginia being especially noteworthy. From the beginning of the 18th century this gradually declined and gave place to a coasting trade in timber and coal. chiefly with Wales and Ireland. The silk industry which flourished in the 17th century is extinct.

See John Watkins, History of Bideford (Exeter, 1792).

BIDPAI (or PILPAI), FABLES OF, the name given in the middle ages (from Sanskrit Visya-pai, chief scholar) to a famous collection of fables of the Sanskrit and Pali poet Kusa-panha, of which the original is lost, but copies may be found in the Pancha Tantra, or Five Sections, an extensive body of early fables or apalogues. A second collection, called the Hitopadesa, has become more widely known in Europe than the first, on which it is apparently founded. In the 6th century A.D., a translation into Pahlavi of a number of these old fables was made by a physician at the court of Chosroes I. Anushirvan, king of Persia. No traces of this Persian translation can now be found, but nearly two centuries later, Abdullah-ibn-Mokaffa translated the Persian into Arabic; and his version, which is known as the "Book of Kaialih and Dimma," from the two last letters of the first syllable, was the first surviving with a knowledge of the fables was transmitted to Europe. It was translated into Greek by Simeon Sethus towards the close of the 11th century; his version, however, does not appear to have been retranslated into any other European language. But the
BIEBRICH—BIENNE

Hebrew version of Rabbi Joel, made somewhat later, was translated in the 13th century into Latin by John of Capua, a converted Jew, in his Directorium vitae humanae (first published in 1480), and in that form became widely known. Since then the fables have been translated into nearly every European tongue. There are several of them in the modern Persian, Malay, Mongol, and Arabic languages.

See Wilson's analysis of the Pancha Tantra, in the Mem. of the Royal Asiatic Soc. i.; Silvestre de Sacy's introduction to his edition of the Kathilah und Dimnah (1816); articles by the same in Notices et Extr. des MSS. de la Bibl. du Rei, vols. i. x. and x.; German translation by Philipp Wolff, Bielpach's Fabeln (2 vols. 2nd ed., Stuttgart, 1839); the Andor-Stuhel, Persian version of the Fables, translated by E. B. Eastwick (Hertford, 1854); Benley, Pantha Tantra, German translation with important introduction (2 vols. Leipzig, 1890); other editions by L. Fritze (ib. 1884) and R. Schmidt (ib. 1901); Max Muller, Essays (Leipzig, 1872), vol. iii. pp. 303, &c. J. Jacobs' edition of Sir T. Cromwell's version of Doni, the complete English version of the fables (London, 1888); J. G. Neith-Falconer, Kathilah und Dimnah, or the Fables of Bielpach (Cambridge, 1895), their history, with a translation of the later Syriac version and notes; Leopold Hervieux, Les Fabulistes Latins, &c. v. Jean de Capcque et ses dervis (1899); E. G. Browne, Persian Literat. (1906), ii. 350.

BIEBRICH, a town of Germany, in the Prussian province of Westphalia, 68 m. S.W. from Hanover on the main line to Cologne. Pop. (1885) 34,912; (1905) 71,797. It is situated at the foot of the Teutoburger Wald, and consists of two portions, separated by the river Lutter, which were first united into one town in 1520. Among its public buildings and institutions are the old town church, with a curious carved altar-piece, the hall, the gymnasium and the provincial industrial school. On the N. Nagel to the town is the castle of Sparnburg, built in the 12th century by Bernhard, count of Lippe. It was for a long time employed as a prison, but was restored after its destruction by fire in 1877 and now contains a historical museum. Bielefeld is the centre of the Westphalian linen industry. It has also important plush, silk and hosiery manufactures, as well as extensive bleaching works, and does a very large export trade to all parts of the world in these branches. Engines, automobiles, biscuits, glass, pianos, furniture and paper are also manufactured.

Bielefeld is mentioned as early as the 9th century, as Belanfeld. In 1742 it became a free city and in 1833 it belonged at this time to the counts of Ravensberg, who often resided in the Sparnburg. It joined the Hanseatic league in 1720, and about the same time began to engage in the linen manufacture, which was greatly extended during the 16th and 17th centuries by a number of refugees from the Netherlands. In 1547 the town passed with the countship of Ravensberg to the duchy of Jülich, and in 1666 to that of Brandenburg.

BIELLEY, a town and episcopal see of Piedmont, Italy, in the province of Novara, 55 m. N.E. of Turin by rail, and 38 m. direct, situated on the S. edge of the lower Alps. Pop. (1901) 16,835, chiefly German. It is situated on the Biella river, just opposite the Galician town of Biella and possesses a fine castle belonging to the Sulzkowsky family, in favour of whom the lordship of Bielitz was raised to a duchy in 1572. It has an important woolen and linen industry, and manufactures of jute and machinery, as well as an active trade, especially of woollens, to the East. The town was founded in the 13th century, and in the 15th and 16th was a fortified place.

BIELTITZ (Czech Bilsko, Polish Biesko), a town of Austria, in Silesia, 50 m. S.E. of Troppau by rail. Pop. (1900) 16,885, chiefly German. It is situated on the Biela river, just opposite the Galician town of Biella and possesses a fine castle belonging to the Sulzkowsky family, in favour of whom the lordship of Bielitz was raised to a duchy in 1572. It has an important woolen and linen industry, and manufactures of jute and machinery, as well as an active trade, especially of woollens, to the East. The town was founded in the 13th century, and in the 15th and 16th was a fortified place.

BIENNE, a town and industrial town in the Swiss canton of Bern. It is built between the N.E. end of the lake of the same name and the point at which the river Suisse or Schneed (on the right bank of which it is situated) issues from a deep cleft (called the Taubenloch) in the Jura range. Bienna is 19 m. by rail N.E. of Neuchâtel, and 21 m. N.W. of Bern. Its industrial importance is shown by the fact that it is the site of the West Swiss technical institute, which has departments for instruction in watch-making, in electricity, in engraving and chasing, and in subjects relating to railways, postal and telegraph matters. Its chief industries are watch-making, chain-making, the manufacture of machines and other objects for use on railways, &c. Its rapidly increasing commercial activity accounts no doubt for the rapid rise in its population, which in 1850 was but 3589, rose in 1870 to 8165, and in 1900 was 22,016, mainly Protestant,
and and two-thirds German-speaking. The parish church of St. Benedict dates from 1451, but was restored in 1775—it has some fine 15th-century painted glass in the choir. In the town is the Schwab museum, which is chiefly notable for its fine collection of objects from the lake-dwellings. To the north-west of Bienna two funicular railways lead up to Evillard (or Leubringen) and Macolin (or Maggligen), both situated on the slope of the Jura.

First mentioned in the 12th century, Bienna was for centuries to be under the jurisdiction of the prince-bishop of Basel. In 1279 (permanently in 1352) it made an alliance with Bern, in 1344 with Soleure, and in 1382 with Fribourg. But its attempts to be admitted into the Swiss Confederation were fruitless, though after it adopted the Reformation in 1525, it was closely associated with the Protestant cantons. In 1798 it was seized by the French, but in 1815, with the greater part of the bishopric of Basel, it became part of the canton of Bern.

See C. A. Bloesch, Geschichte der Stadt Biel (to 1854), (3 vols., Biel, 1855–1856).

BIENNE, LAKE OF, or Bielersee, a lake in Switzerland, S.W. of the town of Bienna, and extending along the southern foot of the Jura range. It is 73 m. in length, 23 m. broad and 249 ft. in depth, while its surface is 1,424 ft. above the sea-level, and its area 16 sq. m. In it is the Ile de St Pierre, where Rousseau resided for a short time in 1765. Many traces of lake-dwellings have been discovered on the shores of the lake. It receives the river Susa or Scheuss at its north-east end, while the Hagneck canal leads the waters of the Aar into the lake, as that of Nidau conducts them out again. At the southern end the river Thieule or Zihl flows into this lake from that of Neuchâtel.

(B. W. A. C.)

BIESTADT, ALBERT (1830–1902), American landscape painter, was born in Solingen, Westphalia, Germany, on the 7th of January 1830, and was taken to the United States when about a year old. In 1853–1856 he studied painting at Düsseldorf. His pictures of the western part of the United States, and particularly the Rocky Mountains, made him widely popular. His "Estes Park, Colorado," is in the collection of the Earl of Dunraven; his "Sierra Nevada" (1878) is in the Corcoran Gallery of Washington, and "The Valley of Yosemite" in the James Lenox collection in New York. He received many German and Austrian decorations, and was a chevalier of the French Legion of Honour. He rendered panoramic views with a certain ability, though his work was rather topographically correct and impressionistic than artistic in conception and execution. He was a member of the National Academy of Design of New York, and is represented by two historical paintings, "The Discovery of the Hudson River," and "The Settlement of California," in the Capitol in Washington, D.C. He died in New York City on the 18th of February 1902.

BIFROST, in Old Norse mythology, the rainbow, which was supposed to form the bridge by which the gods passed between heaven and earth. It was guarded by Heimdal, god of light.

BIGAMY (from Lat. bis, twice, and Gr. γάμος, marriage), in English law, according to the statute now in force (24 and 25 Vict. c. 100, § 57), the offence committed by a person who "being married shall marry any other person during the life of the former husband or wife." In the common law the word had a rather wider meaning, and the marriage of a clerk in minor orders with a widow came within its scope. At the council of Lyons (A.D. 1274) bigamists were stripped of their priestly privileges. The offence was adopted and explained by an English statute of 1767; and bigamy, therefore, became a usual counterplea to the claim of benefit of clergy. However, by an act of 1547 every person entitled to the benefit of clergy is to be allowed the same, "although he hath been divers times married to any single woman or single women, or to any widow or widows, or to two wives or more."

A bigamous marriage, by the ecclesiastical law of England, is simply void. By a statute of 1603 the offence was made a felony. This statute, after being repealed in 1828, was re-enacted and reproduced in the Offences against the Person Act 1861. It is immaterial whether the second marriage has taken place within England and Ireland or elsewhere, and the offence may be dealt with in any county or place where the defendant shall be apprehended or be in custody. The following clause embodies the necessary exceptions to the very general language used in the definition of the offence—"Provided that nothing in this section contained shall extend to any second marriage contracted elsewhere than in England and Ireland by any other than a British subject, or to any person marrying a second time whose husband or wife shall have been continuously absent from such person for the space of seven years then last past, and shall not have been known by such person to be living within that time, or shall extend to any person who at the time of such second marriage shall have divorced from the bond of the first marriage, or to any person whose former marriage shall have been declared void by any court of competent jurisdiction." The punishment is penal servitude for not more than seven years or, imprisonment with or without hard labour, not exceeding two years.

A voidable marriage was provided for in the first instance in order to support a charge of bigamy. A voidable marriage, such as were marriages between persons within the prohibited degrees before the Marriage Act 1836, will be sufficient, but a marriage which is absolutely void as such marriages now are, will not. For example, if a woman marry B during the lifetime of her husband A, and after A's death marry C during the lifetime of B, her marriage with C is not bigamous, because her marriage with B was a nullity. In regard to the second marriage (which constitutes the offence) the English courts have held that it is invalid, unless whether, but for the bigamy, it would have been a valid marriage; or not, unless he is his niece; but if being already married he goes through the ceremony of marriage with her he is guilty of bigamy. In an Irish case, however, it has been held that to constitute the offence the second marriage must be one which, but for the existence of the former marriage, would have been valid. With reference to the case in which the parties to the first marriage have been divorced, it may be observed that no sentence or act of any foreign country dissolving a vinculo a marriage contracted in England by persons continuing to be domiciled in England, for grounds on which it is not liable to be dissolved vinculo in England will be recognized as a divorce (R. v. Lolley 1812, R. & R. 237). Hence, a divorce a vinculo for adultery, in a Scottish court, of persons married in England, is not within the statute. But if a person charged with bigamy in England can prove that he has legally been divorced by the law of the country where the divorced parties were domiciled at the time (even though the ground on which the divorce was granted was not one that would justify a divorce in England) it will be good defence to the charge. Criminal jurisdiction is always regarded as purely territorial, but bigamy (together with homicide and treason) is an exception to this rule. A British subject committing bigamy in any country may be tried for the same in the United Kingdom (Earl Russell's case, 1901).

In Scotland, at the date of the only statute respecting bigamy, that of 1521, cap. 19, the offence seems to have been chiefly considered in a religious point of view, as a sort of perjury, or violation of the solemn vow or oath which was then used in contracting marriage; and, accordingly, it was ordained to be punished with the proper pains of perjury.

Bigamy was punished in England until the reign of William the Conqueror, by death; then the penalty changed to life imprisonment and branding of the right hand. An act of George I, still in force, lessened the penalty to deportation for seven years or imprisonment for two years with or without hard labour. The Offences against the Person Act 1861 changed deportation to penal servitude.

In the United States the law in regard to bigamy is practically founded on the English statute of 1604, with the exception that imprisonment and a fine, varying in the different states, were substituted instead of making the offence a felony. Congress has passed a statute declaring bigamy within the territories and places within the exclusive jurisdiction of the United
States to be a misdemeanour (U.S. Rev. Stat. § 5352). By statute in some states, upon absence of one spouse from the state for five years without being heard of, the other may marry again without committing bigamy, in other states the period is seven years. In most of the states, prosecutions for bigamy are barred after the lapse of a certain number of years. The marriage wherever solemnized must be a valid marriage according to the law of the place of solemnization; if void there, no prosecution for bigamy can be founded upon it. In some where the doctrine of an honest belief that a prior divorce of one of the parties was valid would be a defence to a prosecution for bigamy, in others the contrary is held.

On the continent of Europe, bigamy is punishable in most countries with varying terms of imprisonment, with or without hard labour, according to the circumstances of the case.

BIGELOW, JOHN (1817— ), American journalist and diplomat, was born at Malden, New York, on the 25th of November 1817. He graduated at Union College in 1835, practised law in New York for several years after 1839; took up journalistic work; was joint owner (with William Cullen Bryant) and managing editor of the New York Evening Post (1849—1861); was United States consul at Paris in 1861—1864, and was minister to France in 1864—1867. While consul, Bigelow wrote Les États-Unis d’Amérique en 1853 in order to counteract the apparent desire of the French people for a dissolution of the American Union, by showing them the relative importance of the commerce of the northern and southern states. On discovering that a French château built with the contributions of Napoleon III., was constructing two formidable iron-clads and two corvettes for the use of the Confederacy, he devoted his energies to thwarting this scheme, and succeeded in preventing the delivery of all but one of these vessels to the Confederate agents. In his work entitled France and the Confederate Navy (New York, 1888) he gives an account of this episode. In 1865—66, it devolved upon Bigelow, as minister to France, to represent his government in its delicate negotiations concerning the French occupation of Mexico, and he discharged this difficult task with credit. From 1865 to 1867 he served as secretary of state of New York. He wrote books of travel, of popular biography, or of historical or political discussion, &c., from time to time; but his principal literary achievements were editions, between 1868 and 1888, of Franklin’s autobiography and autobiographical writings, copiously annotated; and of the complete works of Franklin, in ten octavo volumes (New York, 1889-1890). These editions were based in part upon the editor’s personal investigations of manuscripts sources in France and elsewhere, and supplemented the well-known, long serviceable, but less accurate edition of Jared Sparks (Boston, 1867-1870); they have in turn been supplemented by the edition of A. H. Smythe (10 vols., 1905—1907). Mr Bigelow was a close friend of Samuel J. Tilden, and became his literary executor, editing his speeches and other political writings (1885), publishing a biography in 1895, and editing a two-volume collection of Tilden’s letters and literary memoirs (1908). He also wrote a biography of William Cullen Bryant (1896). In 1857 he published a volume entitled The Mystery of Sleep (2nd ed., 1903). In 1900 he published Retrospections of an Active Life.

BIGGAR, a police burgh of Lanarkshire, Scotland. Pop. (1901) 2956. It is situated about 10 m. S.E. of Carstairs Junction (Caledonian railway), where the lines from Edinburgh and Glasgow connect. Lying on Biggar Water and near the Clyde, in a bracing, picturesque, upland country, Biggar enjoys great vogue as a health and holiday resort. It was the birthplace of Dr John Brown, author of Rab and his Friends, whose father was secession minister in the town. It was created a burgh of barony in 1451 and a police burgh in 1863. St Mary’s church was founded in 1543 by Lord Fleming, the head of the ruling family in the district, whose seat, Boghall Castle, however, is now a ruin. John Gladstone, great-grandfather of W. E. Gladstone, was a burgess of Biggar, and lies in the churchyard.

Easter Gledstanes, the seat of the family from the 13th to the 17th century, and the estate of Arthurshields, occupied by them for nearly a hundred years more, are situated about 3 m. to the north-west of the burgh. On the top of Quothquan Law (1097 ft.), about 3 m. west is a rock called Wallace’s Chair, from the tradition that he held a council there prior to the battle of Biggar in 1297. Lamington, nearly 6 m. south-west, is well situated on the Clyde. It is principally associated with the family of the Lamingtons, and not with the Lamingtons, a family of patrician blood (d. 1314), lord high treasurer of Scotland, William Baillie and Provand (d. 1593), the judge, and William Baillie (fl. 1648), the general whose strategy in opposition to the marquess of Montrose was so diligently stultified by the committee of estates. The ancient church of St Ninian’s has a fine Norman doorway. Lamington Tower was reduced to its present fragmentary condition in the time of Edward I., when William Heselrig, the sheriff, laid siege to it. The defenders, Hugh de Bradfute and his son, were slain, and his daughter Marion—the betrothed, or, as some say, the wife of William Wallace—was conveyed to Lanark, where she was barbarously executed because she refused to reveal the whereabouts of her lover. Wallace exacted swift vengeance. He burnt out the English garrison and killed the sheriff.

BIGGLESWADE, a market town in the Biggleswade parliamentary division of Bedfordshire, England, 41 m. N. by W. of London by the Great Northern railway. Pop. of urban district (1901) 5120. It lies on the east bank of the Ivel, a tributary of the Ouse, in a flat plain in which vegetables are largely grown for the London markets. The town is a centre of this trade.

Biggleswade (Bichellswe, Beckleswede, Bickleswade) is an ancient place, which has surrendered the manor, which according to Domesday passed to Ralf de Insula. Henry I. granted it to the bishop of Lincoln, under whose protection the borough evidently grew up. In 1547 the bishop surrendered his rights to the king, and in the 17th century Biggleswade formed part of the union of Bedfordshire. Owning to its important position on the Roman road to the north, the town became an agricultural centre for the surrounding district. In 1335 Edward III. renewed the bishop’s licence to hold a Monday market, and annual fairs were held here from very early times. Those for horses are mentioned as famous by Camden. In addition to agriculture, Biggleswade was formerly engaged in straw-plaiting and the manufacture of leather.

BIGHT (O. Eng. biht, bend; cf. Ger. Bücht, a bay, and beugen, to bend), a nautical term for the loop or bent part of a rope, as distinguished from the ends; also a geographical term for a bay between two distant headlands, or with a shallow curve, e.g. the Bight of Benin, the Great Bight of Australia.

BIGNON, JÉRÔME (1585—1656), French lawyer, was born at Paris in 1585. He was uncommonly precocious, and under his father’s tuition had acquired an immense mass of knowledge before he was ten years of age. In 1600 was published a work by him entitled Chronographie, ou description de la Terre Sainte. The great reputation gained by this book introduced the author to Henry IV., who placed him for some time as a companion to the duc de Vendôme, and made him tutor to the dauphin, afterwards Louis XIII. In 1604 he wrote his Discours de la ville de Rome, and in the following year his Traité sommaire de l’élection du pape. He then devoted himself to the study of law, wrote in 1610 a treatise on the precedence of the kings of France, which gave great satisfaction to Henry IV., and in 1613 edited, with learned notes, the Formulae of the jurist Marcile. In 1620 he was made advocate-general to the grand council, and shortly afterwards a councillor of state, and in 1626 he became advocate-general to the parlement of Paris. In 1641 he resigned his official dignity, and in 1642 was appointed by Richelieu to the charge of the royal library. He died in 1656.

BIGNON, LOUIS PIERRE ÉDOUARD, BARON (1771—1841), French diplomatist and historian, born on the 3rd of January 1771, was the son of a dyer at Rouen. Though he had received a good education, he served throughout the early part of the revolutionary wars without rising above the rank of private. In 1797, however, the attention of Talleyrand, then minister of foreign affairs, was called to his exceptional abilities by General
Huet, and he was attached to the diplomatic service. After serving in the legations in Switzerland and the Cisalpine republic, he was appointed in 1799 attached to the French legation at Berlin, of which three years later he became chargé d'affaires. As minister-plenipotentiary at Cassel between the years 1803 and 1806, he took part in the negotiations which led up to the formation of the confederation of the Rhine; and after the battle of Jena he returned to Prussia as administrator of the public domains and finances. He filled a similar function in Austria after the battle of Wagram. At the end of 1810 he became French resident at Warsaw and was for a couple of years supreme in the affairs of the grand duchy.

The preparation of a constitution for Poland, on which he was engaged, was, however, interrupted by the events of 1812. Bigod, after a short imprisonment at the hands of the allies, returned to France in time to witness the downfall of Napoleon. During the Hundred Days he twice more entered Napoleon's service, and, after Waterloo, as minister of foreign affairs under the executive commission, it was he who signed the convention of the 3rd of July 1815, by which Paris was handed over to the allies. Bigod did not re-enter public life until 1817, when he was elected to the council of deputies, in which he sat until 1830, consistent in his opposition to the reactionary policy of successive governments. His great reputation and his diplomatic experience gave a special weight to the attacks which he published on the policy of the continental allies, two of his works attracting special attention, Du Congrès de Troppau ou Examen des propositions des monarques absoluës à l'égard de la monarchie constitutionnelle de Naples (Paris, 1821), and Les Cabinets et les peuples depuis 1815 jusqu'à la fin de 1822 (Paris, 1822).

The revolution of 1830, which brought his party into power, only led to a very temporary resumption of office by Bigod. He was for a few weeks minister of foreign affairs in the first government of Louis Philippe, and again for a few weeks minister of public instruction. But the idea of making him responsible for the foreign policy of France could not be realized owing to the necessity under which Louis Philippe lay of courting the goodwill of the powers, in whom Bigod had a deep interest in the writings. Elected deputy in 1831 and member of the chamber of peers in 1830, he withdrew for the most part from politics, to devote himself to his great work, the Histoire de France sous Napoléon (10 vols. 1829-1838, then 4 posthumous vols., 1847-1850). This history, while suffering from the limitations of all contemporaneous narratives, contains much that does not exist elsewhere, and is one of the best-known sources for the later histories of Napoleon's reign.

See Mignet, Notice historique sur la vie et les ouvrages de M. Bignon (1852).

BIGOD, HUGH (d. 1177), earl of Norfolk, was the second son of Roger Bigod (d. 1127), the founder of the English family of this name. Hugh inherited large estates in East Anglia on the death of his brother William in 1120, and enjoyed the favour of Henry I. At first a supporter of Stephen during this king's struggle with the:empress Matilda, Hugh was rewarded with the earldom of Norfolk before 1141. After having fought for the king at the battle of Lincoln the earl deserted him, assumed a position of armed neutrality during the general anarchy, and then assisted Henry II. in his efforts to obtain the throne. This king considered himself in possession of his earldom; but becoming restless under the rule of law initiated by Henry, he participated in the revolt of 1173, which so far as England was concerned centred round his possessions. Though defeated and compelled to surrender his castles, Bigod kept his lands and his earldom, and lived at peace with Henry II. until his death, which probably took place in Palestine.

His son Roger (d. 1221), who succeeded to the earldom of Norfolk, was confirmed in his earldom and other honours by Richard I., after he had fallen under the displeasure of Henry II. He took part in the negotiations for the release of Richard from prison, and after the king's return to England became justiciar. The earl was one of the leaders of the baronial party which obtained John's assent to Magna Carta, and his name appears among the signatures to this document.

Roger was succeeded as 3rd earl by his son, Hugh, who died in 1225, leaving a son, Roger (d. 1270), who became 4th earl of Norfolk. Through his mother, Matilda, a daughter of William Marshal, earl of Pembroke, Roger obtained the office of marshal of England in 1246. He was prominent among the barons who wrested the control of the government from the hands of Henry III., and assisted Simon de Montfort. The earl married Isabella, daughter of William the Lion, king of Scotland, but left no sons.

Hugh, the 3rd earl, left a younger son, Hugh (d. 1266), who was chief justiciar of England from 1258 to 1260, and who fought for Henry III. at the battle of Lewes. The latter's son, Roger, succeeded his uncle Roger as 5th earl of Norfolk in 1270. This earl is the hero of a famous altercation with Edward I. in 1297, which arose out of the king's command that Bigod should serve against the king of France in Gascony, while he went to Flanders. The earl asserted that by the tenure of his lands he was compelled to serve across the seas in the company of the king himself, whereupon Edward said, "By God, earl, you shall either go or hang," to which Bigod replied, "By the same oath, O king, I will neither go nor hang." The earl gained his point, and after Edward had left for France he and Humphrey Bohun, earl of Hereford, prevented the collection of an aid for the war and forced Edward to confirm the charters in this year and again in 1301. Stubbs says Bigod and Bohun "are but degenerate sons of mighty fathers; greater in their opportunities than in their patriotism."

The earl died without issue in December 1306, when his title became extinct, and his estates reverted to the crown. The Bigods held the hereditary office of steward (daisier) of the royal household, and their chief castle was at Framlingham in Suffolk.

BIGOT, one obstinately and intolerantly holding particular religious opinions, who refuses to listen to reason and is ready to force others to agree with him; hence also applied to one who holds similar views on any subject. The early meaning of the word in English, at the end of the 16th century, was that of a religious hypocrite. The origin is obscure; it appears in French, in the forms bigot or bigos, in the 12th century romance of Girard of Roussillon, where it is applied to certain tribes of southern Gaul, and in the Roman du Roi de Wace (d. 1175) as an abusive name given by the French to the Normans: "Moutel on Francheois Normans laids et de measif et de mesdis." "Bigot" is not derived from a word signifying a remark or a suggestion, but from the French dits de mesdames, which is a corruption of the word dits de mesdames, "bigos et Draschiers."

To this use has been attached the absurd origin from "ne se, bi god," the words in which, according to the 12th century chronicle, Rollo, duke of the Normans, refused to kiss the foot of Charles III., the Simple, king of the West Franks. The word may have some connexion with a corruption of Visigoth, a suggestion to which the use in the Girard romance lends colour. The meaning changed in French to that of "religious hypocrite" through the application, in the feminine bigote, to the members of the religious sisterhoods called Beguines (q.v.).

BIG RAPIDS, a city, seat of Kent county, in the southern part of Mecosta county, Michigan, U.S.A., on both sides of the Muskegon river, 56 m. N. by E. of Grand Rapids, in the west central portion of the lower peninsula. Pop. (1890) 5303; (1900) 6868, of whom 881 were foreign-born; (1910, U.S. census) 4510. It is served by the Père Marquette and the Grand Rapids & Indiana railways. Big Rapids is the seat of the Ferris Institute (opened 1884, incorporated 1894), a large private co-educational school, founded by W. N. Ferris. The river, which falls 16 ft. within the city limits, is dammed a short distance south of the city, and 16,000 horse-power is generated, part of which is transmitted to the city. The principal manufactures are lumber and furniture, and saw-filing and filing-room machinery. Big Rapids, named from the falls of the Muskegon here, was settled in 1854, was platted in 1859 and was chartered as a city in 1860.
BIGSBY—BIHARI

BIGSBY, JOHN JEREMIAH (1792–1881), English geologist and physician, the son of Dr John Bigsbys, was born at Notting-
ham on the 14th of August 1792. Educated at Edinburgh,
where he took the degree of M.D., he joined the army medical
service and was stationed at the Cape of Good Hope in 1817.
After two years he went to Canada as medical officer of a
regiment, and having developed much interest in geology he was
commissioned in 1819 to report on the geology of Upper Canada.
In 1822 he was appointed British secretary and medical officer
to the Boundary Commission, and for several years he made
extensive and important geological researches, contributing
to the American Journal of Science and other scientific
journals; and later embodying an account of his travels in a
book entitled The Shoe and Cane (1850). Returning to England
in 1827 he practised medicine at Newport until 1846 when he
removed to London, where he remained until the end of his life.
He now took an active interest in the Geological Society of
London, of which he had been elected a fellow in 1823. In 1869
he was elected a fellow of the Royal Society, and in 1873 he was
awarded the Murchison medal by the council of the Geological
Society. During the last twenty years of his life he was
continually at work preparing, after the most painstaking
research, tabulated lists of the fossils of the Palaeozoic rocks.
His Thesaurus Siluricus was published with the aid of the
Royal Society in 1865; and the Thesaurus Devonico-Carboniferus
in 1873.

BIHARI (properly Bihāri), the name of the most western of
the four forms of speech which comprise the Eastern Group of
modern Indo-Aryan languages (q.v.). The other members are
Bengali, Oriya and Assamese (see Bengali). The number of
speakers of Bihari in 1901 was 34,579,844 in British India, out
of a total of 90,242,167 for the whole group. It is also the
language of the inhabitants of the eastern half of the Tarai district
of Nepal. In the present article it is throughout assumed that
the reader is in possession of the facts described under the heads
of Indo-Aryan Languages and Prakrit. The article Bengali
may also be studied with advantage.

"Bihāri" means the language of the province of "Bihār," and
to a certain extent this is a true description. It is the
direct descendant of the old Magadhi Prakrit (see Prakrit), of
which the headquarters were South Bihār, or the present districts
of Patna and Gaya. It is, however, also spoken considerably
beyond this province of Magadha. To the west it extends over
the province of Agra so far as the longitude of Benares; to the
south it covers nearly the whole of the province of Chota
Nagpur. Allowing for the speakers in Nepal, its area extends
over about 90,000 sq. m., and the total number of people who
claim it as a vernacular is about the same as the population
of France. Bihari has been looked upon as a separate language
only during the past twenty-five years. Before that it was
 grouped with all the other languages spoken between Bengal
and the Punjab, under the general term "Hindi." The
usual character employed for writing Bihari is that known as
Kaithi or Kāyasth, the character of the well-known Nagarī character
of Upper India. The name of the character is derived from the
Kāyath or Kāyasth caste, whose profession is that of scribes.
Kaithi is widely spread, under various names, all over northern
India, and is the official character of Gujarati. The Nagarī
character is commonly employed for printed books, while the
Brahmans of Tirhut have a character of their own, akin to that
used for writing Bengali and Assamese. In the south of the
Bihari tract the Oriya character belonging to the neighbouring
Orissa is also used.

Bihari has to its east Bengali, also a language of the Outer
Band. To its west it has Eastern Hindi, a language of the
Intermediate Band (see Indo-Aryan Languages). While it
must decidedly be classed as an Outer language, it nevertheless
shows, as might be expected, some points of contact with the
Intermediate ones. Nothing is so characteristic of Bihari as
its pronunciation of the vowel a and of the consonant s. The
first is sounded like the o in "hot" (transliterated o). In
Eastern Bihari the same vowel has a broad sound, but not so
broad as in Bengali. As we go westwards this broad sound is
gradually lost, till it entirely disappears in the most western
parts of Bihari (1792–1881).

In the pronunciation of s is a literal shibboleth between Bengal and Upper India.

For centuries Bihari has been connected politically with the
Maithili (see Indo-Aryan Languages) and the Magahi (see
Magahi). Maithili is the dialect of the country corresponding to the ancient Magadha, and may therefore be taken as the modern representative of the
puré Magadhi Prakrit. Its northern boundary is generally
the river Ganges, and its western the river Son. To the south
it has overflown into the northern half of Chota Nagpur. It
is nearly related to Maithili, but it is quite uncultivated and has
no literature, although it is the vernacular of the birthplace of
Buddhism. Nowadays, it is often referred to by natives of other
parts of India as the "typical Maithili." While Maithili faces Maithili across the Ganges. It is the dialect of
the old country of Mathil or Tirhut, famous from ancient times
for its learning. Historically and politically it has long been
connected with Oudh, the home of the hero Rāma-candra,
and its people are amongst the most conservative in India.
Their language bears the national stamp. It has retained
numerous antiquated forms, and parts of its grammar are
extraordinarily complex. It has a small literature which has
helped to preserve these peculiarities in full play, so that
though it is spoken over a larger area than Maithili it is not
found in the everyday talk of Mathil. The western division consists of
the Bhuijuri dialect, spoken on both sides of the Gangetic valley, from near Patna to Benares. It has extended south-east into the southern half of Chota Nagpur, and is spoken by at
least twenty millions of people who are as free from prejudice
as the inhabitants of Mithila are conservative. The
Bhojpuris are a fighting race, and their language is a practical one, made for everyday use, and simple and straightforward as Mathil and
Magahi are complex. In fact, it might almost be classed as a
separate language, had it any literature worthy of the name.

(Abbreviations: Mth. = Maithili, Mg. = Magahi, Bh. = Bhojpurī,
Magadi Prakrit.)

Vocabulary.—The Bihari vocabulary calls for few remarks.
Patāsama, or words borrowed from modern times, are
commonly called "prakrits" (see Indo-Aryan Languages), are few in number, while all the dialects are replete with homoeopathic tadbhavanas, used (unlike Bengali)
both in the literary and in the colloquial language. Very few words are derived from Prakrit or from Patāsama, which is

Phonetics.—The stress-accent of Bihari follows the usual rules
of modern Indo-Aryan vernaculars. In words of more than one
syllable it cannot fall on the last, whether the vowel of that syllable
is long or short, pronounced, half-pronounced, or not pronounced.
With this exception, the accent always falls on the last long syllable.
If there are no long syllables in the word, the accent is thrown back
as far as possible, but never farther than the syllable before the
accent point. Thus ki-mi-na is pronounced ki-mi-nə; this is not pronounced ki-mi-nə. In the last word there is a
secondary

BIHARI

925

can everywhere be formed by the addition of some noun of multitude to the singular, as the universals in Mth. and th, it is generally made by adding *n* or (in Bh.) *nh* or *ni* to the singular, before all of which a final vowel is shortened. Thus *ghōrā*, a horse, *ghōț̄ian*, horses.

As for cases, the Apabhramśa locative -hi (ći) and the ablative -hu (see Prakrit) terminations have survived in poetry, pronouns, and the like, and each of them can now be used for any oblique case; except that the honorific form in *hi* is contracted to *t* and *k*, the former of which is employed for the instrumental and the latter for the locative case. Thus, *ghör*; *ghōr*, by a house; *ghōrē*, in a house. The old termination -hu has also survived in sporadic instances, under the form ã, with an ablative sense. Cases are, however, usually formed, as elsewhere, by suffixing postpositions to a general oblique case (see Indo-Aryan Languages). The oblique case in Bihari is generally the same as the nominative, but a few special terminations have been noticed, especially in those dialects which have retained the short vowel *a* or *ah* in the ablative of personal pronouns. Thus, in Mth., *mæri*-hi, the act of striking, obl. *mæri*-al-ahā. Another set of verbal nouns forms the oblique case in a, e, *d̄hi*, thus, Bb., *mār*, the act of striking, *mār*-lā, for striking, to strike. In Mgh., every noun ending in a consonant may have its oblique form in e; thus, *phār*, a house, *phār*-ke or *phār*-ke, of a house. The ai- or e- termination is another relic of the Apabhramśa -hi, and *d* is a survival of the Ap. -hu.

The usual genitive postposition is *k*, which has become a suffix, and now forms part of the word to which it is attached, a final *v* being frequently dropped after it. Hence, *k* is to be translated as *the possession of*. We may compare the Sanskrit, or tatasma, with the English "aye," and the lubdhata ai with the English "a*". In counting syllables in Bihari, as long as two vowels, or two non-consonantal syllables, are not classified as one syllable. The Skr. *r* appears only in tatasmas. Nasalization of vowels is extremely frequent. In this article it is represented by the sign -o over the vowel, as in mūb, mūpā or dēkālābh. The vowels *a* and *e* are frequently pronounced as strongly buried *r* and *th*, and are then transliterated as *r* and *th*. There is a constant tendency to change these to an ordinary dental *r* and *th*; thus, ghōrā, pronounced *ghōr*, or *ghōr*ā, is also pronounced as *ghō̄r* or *ghō̄r*-ā, and is transliterated as *ghōr* or *ghōr*-ā.

The main typical characteristics of Mg. Fr. are that western Fr. *r* becomes *l* mainly in the eastern languages. We have seen that the change of *s* to *ś* occurs in Bihari but not in Bihari, and have given reasons for the change back to *s* in the latter language, although the Mg. Fr. *ś* is retained in writing. In both Bihari and Bihari, a western type is represented by the long vowel *ī* as *ī* or *ī* in *ī* or *ī* in *ī*.

The Skr. *ṛ* and *ṛ* are both pronounced as a dental *r*, but (a relic of the old Mg. Fr.) *ṛ* and *ṛ* are both invariably written as a palatal *ś* in the Katihi character. Thus, the English word "session" is translated as *śeśon* and pronounced like *ś̄eśon*, with a strong palatal glide. *Śr* is also pronounced as strongly buried *r* and *th*, and are then transliterated as *r* and *th*. Thus, sasṭā, sixth, is pronounced khaśṭhā. As a general statement we may say that Bihari spelling is not fixed, and that there are often many ways of writing, and sometimes two or three ways of pronouncing the same word.

The genius of the Bihari language is adverse to the existence of a long vowel in a lubdhwā word, when would occur as that where it was longer than two syllables from the end. Thus, ghōrā, but ghōrō; *mārā", but mārī. This is subject to various subsidiary rules which will be found in the grammars. The principle is a most important one, but the principles of all Indo-European languages are for the most part carried out with the greatest thoroughness and consistency in Bihari. The whole system of declension and conjugation is subject to it. When preceding tone is short, the vowel becomes either slightly shortened *d̄* or it becomes a stem.

Declension.—Bihari has a stronger sense of gender than the other languages of the Eastern Group. In the modern language the distinction is confirmed to some extent, in the poetic, but in the poetry the system of grammatical, as distinct from sexual, gender is in full swing. Except in the case of the interrogative pronoun, there is no need for gender—words which in Skr. and Pr. were neuter being generally, but not always, treated as masculine. The plural

---|---|---|---
ham | ham | ham | ham
hamār | hamār | hamār | hamār
hamār-ś | hamār-ś | hamār-ś | hamār-ś
Plur. Nom. | hamār-sab | hamār-sab | hamār-sab
hamār-sab | hamār-sab-ke | hamār-sab-ke | hamār-sab-ke
hamār-sab | hamār-sab | hamār-sab | hamār-sab

The important point to note in the above is that the oblique form singular is formed from the genitive. It is the oblique form of that form, which is also used in common location. They are familiar and often contemptuous. Sometimes they give a definite force to the word, as ghōrō, the horse. In the femine they are much used to form diminutives.

In the other languages of the Eastern Group, the singulars of the personal pronouns have fallen into disuse. The plurals are used poetically for the singulars, and new forms are made from the old. These forms are more frequently used in conversation. They are familiar and often contemptuous.

As a specimen of pronominal declension, we may give the most common forms of the first person plural pronoun.

The origin of the postpositions is discussed in the article Hindi-Stan.
English) substitutes the oblique form of the verbal noun for the present participle, as in mārē hi, I am a-striking.

There are numerous irregular verbs. Most of the irregularities are due to the root ending in a vowel or in a weak consonant such as b (=Pr. v).

There is a long series of transitive verbs formed from intransitives and of causal verbs formed from transitives, generally by adding English): 

In Mth. all the forms in which the object is honorific end in -nhi, Mg. closely follows this, but the forms are more abraded.

In Mth. the usual verbal substantive and auxiliary verb is, as in Bengali, on the root aš (Skr. techāi), the initial vowel being generally dropped, as in ā(ch), I am; chā(k)āt, I was; but a(ch), he is. In Mg. we have hā or kīkī, I am; kala(i), I was. The finite verb has three verbal nouns or infinitives, viz. (from the root mār, strike), Mth. mārā, Mg. mārā, and mārāl. All three are fully declined as nouns, the oblique forms being mārāi or mārē, mārā, and mārā, respectively. There are two participles, a present (Mth. mārāit = Pr. mārēnta) and a past (Mth. mārāt = Pr. mārē-alla). The Mgh. forms are very similar. The old Mgh. pr. present and imperative have survived, but all other tenses are made from verbal nouns or participles. The past tense (of which the conjugation for a Maithili transitive verb is given above) is formed by adding pronominal suffixes to the past participle. Thus, mārē-tu (Mth.) mārī-t, mārē-tu (Mgh.), becomes mārēhi, I struck. In the case of intransitive verbs, the suffixes may represent the nominative and not the instrumental case of the pronoun, and hence the conjugation is somewhat different. The future is a mixed tense. Generally speaking, the first two persons are formed from the verbal noun in b, which is by origin a future passive participle, and the third person is formed from the present participle. Thus, mārēb-t, by-actively being mārēbāt, I strike, and mārēb-ta, striking-the, becomes mārēthi, he will strike (compare the English "he is going," for "he is on the point of going"). A past conditional is also formed by adding the appropriate suffixes to the present participle, as in māraith (if I had struck). This use of the present participle already existed in the Pr. age (cf. Hema-candra's Grammar, iii. 186). In Mth. the nouns, pronominal and pronominal are formed by conjugating the present or past tense respectively of the auxiliary verb with the present participle; thus marath chi, I am striking. Mg. (like vulgar

BIHARI-LAL—BIJAPUR 927

Bihari Literature.—In all three dialects there are numerous folk-epics transmitted by word of mouth. Several have been published at various times in the *Journal of the Asiatic Society of Bengal* and in the *Zeitschrift der deutschen morgenländischen Gesellschaft*. The only dialect which has any real literature is Maithili. The earliest writer of whom we have any record is Vidyapati Thakura (Vidyapati Thakur), who lived in the 14th century. Two of his poems of the Rukmiita-parinaya and the Vidyapati’s Sanskrit Purus-a-paritih are deservedly popular.

No special works have been written about Magahi. (G. A. G.)

**BIHARI-LAL**, a name famous in Hindustani literature, as the author of the *Sul-sul*, a collection of approximately seven hundred distichs, which is perhaps the most celebrated Hindu work of poetic art, as distinguished from narrative and simpler styles. The language is the form of Hindi called Brj-bhojaka, spoken in the country about Mathura, where the poet lived. The couplets are inspired by the Krishna side of Vishnu-worship, and the majority of them take the shape of amorous utterances of Rādhā, the chief of the Gopīs or cowherds maidens of Braj, and her divine lover, the son of Vasudeva. Each couplet is independent and complete in itself, and is a triumph of skill in compression of language, felicity of description and rhetorical artifice. The distichs, in their collected form, are arranged, not in any sequence of narrative or dialogue, but according to the technical classification of the sentiments which they convey as set forth in the treatises on Indian rhetoric. Little is known of the author beyond what he himself tells us. He was born in Gwalior, spent his boyhood in Bundelkhand, and on his marriage settled in his father-in-law’s household in Mathurā. His father was named Kṣaṇa Rāy; he was a twice-born (Devīja) by caste, which is generally understood to mean that he was a Brāhmaṇ, though some assert that he belonged to the mixed caste, now called Rāy, sprung from the offspring of a Brāhmaṇ father by a Kṣaṇiṭrī mother. A couplet in the *Sul-sul* states that it was completed in a.d. 1662. It is certain that his patron, whom he calls Jai Śah, was the Rājā of Amber or Jaipur, known as Mitrā Jai Singh, who ruled from 1617 to 1667 during the reigns of the emperors Jahāngīr, Shāh Jahān and Aurangzēb. A couplet (No. 705) appears to refer to an event which occurred in 1665, and in which Rājā Jai Singh was concerned. For this prince the couplets were composed, and for each dōhā the poet is said to have received a gold piece worth sixteen rupees.

The collection very soon became celebrated. As the couplets are independent one of another, and were put together fortuitously as composed, many different recensions exist; but a standard is that settled by an assembly of poets under the direction of Prince A’zām Shāh, the third son of the emperor Aurangzēb (1653-1707), and hence called the A’zām-shāhī; it comprises 726 couplets. The estimation in which the work is held may be measured by the number of commentators who have devoted themselves to its elucidation, of whom Dr Grierson mentions seventeen. Two of them were Musalmaṇs, and two other commentaries were composed for Musalmaṇ patrons. The collection has also twice been translated into Sanskrit. The unknown author was called the Lāla-chandārikā. The author was employed by Dr Ghilich in the College of Fort William, where he finished his commentary in 1818. A critical edition of it has been published by Dr G. A. Grierson (London, 1891). See also Government of India Press, 1896).

**BIJAPUR**, an ancient city and modern district of British India in the southern division of Bombay. It is a station on the Southern Mahantra railway, 60 m. S. of Sholapur. The ancient city was supplied with water by an elaborate underground system of reservoirs and aqueducts, which has been restored in part as a famine relief work. The population in 1901 was 23,811. The city was used to be the extensive, splendid and opulent capital of an independent sovereignty of the same name, but now retains only the vestiges of its former grandeur. It is still, however, the most picturesque collection of ruins in India. The city of Bijapur owed its greatness to Yusuf Adil Shah, the founder of the independent state of Bijapur. It consists of three distinct portions—the citadel, the fort and the remains of the city. The citadel, built by Yusuf Adil Shah, a mile in circuit, is of great strength, well built of the most massive materials, and encompassed by a ditch 100 yds. wide, formerly supplied with water, but now nearly filled up with rubbish, so that its original depth cannot be discovered. Within the citadel are the remains of Hindu temples, which prove that Bijapur was an important town in pre-Mahommedi times. The fort, which was completed by Ali Adil Shah in 1566, is surrounded by a wall 6 m. in circumference. This wall is from 30 to 50 ft. high, and is strengthened with ninety-six massive bastions of various designs. In addition there are three forts at the various gateways. The width is about 25 ft.; from bastion to bastion runs a battlemented curtained wall about 10 ft. high. The whole is surrounded by a deep moat 30 to 40 ft. broad. Inside these walls the Bijapur kings bade defiance to all comers. Outside the walls are the remains of a vast city, now for the most part in ruins, but the innumerable tombs, mosques, caravanserais and other edifices, with which the landscape is dotted, afford abundant evidence of the ancient splendour of the place. Among its many buildings the three are specially worthy of mention. The Gol Gunbaz, or tomb of Sultan Mahommed Adil Shah, which was built 1626-1656, is one of the most interesting buildings in the world. It is a square building, 135 ft. each way, which is surmounted by a great circular dome 10 ft. high. The inside area (18,320 sq. ft.) is greater than the Pantheon at Rome (15,533 sq. ft.). When first built the dome was covered by gold leaf, and the outer walls were adorned with stucco work picked out in gold and blue, but to-day there are very few traces of this
ornamentation. Of late years this mosque has been thoroughly restored, and one portion is now used as a museum in which all objects of interest discovered in the surrounding country are exhibited. Next to this comes the Ibrahim Roza, or tomb and mosque of Ibrahim Adil Shah II., which was completed about 1620 and is supposed to be one of the most exquisitely built in the world after the Taj at Agra. It is said to have cost £1,700,000 and to have occupied thirty-six years in its construction. The Gagan Mahal, or ancient audience hall, is now a mass of ruins, but when complete must have been a beautiful building. The archway remains. It is over 60 ft. span and about 90 ft. high. Through this arch Sikandar Adil Shah, the last king of Bijapur, was brought bound with silver chains, while on a raised platform sat Aurangzeb, the Mogul emperor, who had left Delhi three years previously to conquer the Deccan. This magnificent palace, which was taken by the Mahrattas in 1724 after the Bijapur dynasty occurred, is now the abode of hundreds of pigeons. Their cooing is the only sound that breaks the silence of the old halls.

History.—The founder of the Bijapur dynasty, Yusuf Adil Shah, is said by Ferishta to have been a son of the Ottoman sultan Murad II. When on his accession Mahmood II. gave orders for the strangling of all his brothers, Yusuf was saved by a stratagem of his mother. He went to India, where he took service under the Bahmani king of the Deccan, and ultimately became a person of great importance at the court of Mahmud II. In 1480 he was sent in advance of the army to seize the heads of the enemy. It was captured without a blow, and he established himself as an independent sultan at Bijapur, his dominions including Goa on the west coast. He died in 1531 (Goa had been taken by the Portuguese a few months before), and was succeeded by his son Ismail, who reigned prosperously till 1534. The next king worth mentioning is Ali Adil Shah I., who reigned from 1537 to 1579 and, besides the fort, built the Jama Masjid or great mosque, the aqueducts and other notable works in the city. His son Ibrahim (d. 1626) maintained the prosperity of the state; but under his successor, Mahmood Adil Shah (d. 1656), the rise of the Mahratta power under Sivaji began to make inroads upon it, and it was exposed to the yet more formidable ambition of Shah Jahan. On the death of Mahmood the succession passed to Ali Adil Shah II., and on his death in 1627 to his infant son, Sikandar Adil Shah, the last of the race. The kingdom had been for some time rapidly falling to ruin, and in 1668 the Mogul emperor Aurangzeb, who as Shah Jahan's general had unsuccessfully besieged the city under Mahmood Adil Shah, took Bijapur and annexed the kingdom to the Delhi empire. Among the curiosities of the capital is the celebrated monkey gun (Malkh-i-Maidan), stated to be the largest of its kind in the world. The royal tombs are situated on the boundary of the Punjab, near the town of Modderabad. The British Methodists have a mission, which maintains some aided schools, and there is an English high school for boys.

The principal crops are millet, wheat, pulse, oil-seeds and cotton. There are considerable manufactures of cotton and silk goods and blankets, and several factories for ginning and pressing cotton. The East Deccan line of the Southern Maharratta railway traverses the district from north to south.

BIJAWAR, a native state of central India, in the Bundelkund agency. Area, 973 sq. m.; pop. (1901) 110,500; revenue, £10,000. Forests cover nearly half the total area of the state, which is believed to be rich in minerals, but lack of transport facilities has hindered the development of its resources.

The state takes its name from the chief town, Bijawar (pop. in 1901, 5220), which was founded by Bijai Singh, one of the Gond chieftains of Garha Mandla, in the 17th century. It was conquered in the 18th century by Chhatarsal, the founder of Panna, a Rajput of the Bundela clan, by whose descendants it is still held. It was transferred to Ratan Singh in 1818 by the British government for the usual deed of allegiance. In 1857 Bhan Pratap Singh rendered signal services to the British during the Mutiny, being rewarded with certain privileges and a hereditary salute of eleven guns. In 1866 he received the title of maharaja, and the prefix sajwai in 1877. Bhan Pratap was succeeded on his death in 1899 by his adopted son, Sanwant Singh, a son of the maharaja of Orchha.

BIJNOR, or Bijnor, a town and district of British India in the Bareilly division of the United Provinces. The town is about 3 m. from the left bank of the Ganges. The population in 1901 was 17,582. It is situated on the Ganges. The American Methodists have a mission, which maintains some aided schools, and there is an English high school for boys.

The town was founded by the Pathans in the 14th century, and was at one time the residence of the Pathan ruler of the Deccan. It has been a centre of trade since early times, and has a large trade in cloth. The town was taken by the British in 1857, and is now the headquarters of the district. The principal crops are millet, wheat, pulse, oil-seeds and cotton. There are considerable manufactures of cotton and silk goods and blankets, and several factories for ginning and pressing cotton. The East Deccan line of the Southern Maharratta railway traverses the district from north to south.
BIKANIR—BILASPUR

929

(On the 1st of June) it was occupied by the nawab of Najibabad, a grandson of Zabita Khan. In spite of fighting between the Hindus and the Mahomedan Pathans the nawab succeeded in maintaining his position until the 21st of April 1828, when he was defeated by the British at Nagina; whereupon British authority was restored.

BIKANIR, a native state of India, in the Rajputana agency, with an area of 23,311 sq. m. The natural aspect of the country is one desolate tract, without a single permanently running stream. Its surface is overspread with undulating sand-hills, of from 20 to 100 ft. above the average level, and so loose that men and quadrupeds stepping off the beaten track sink as if in snow. Two streams, the Kati and Ghaggar, attempt to flow through this dismal region, but are lost in its sands. Water is very scarce, and is raised from wells of from 250 to 340 ft. in depth. A few shallow salt lakes are filled by rain water, but they dry up on the setting in of the hot weather, leaving a thick crust of salt on their beds, which is used for commercial and domestic purposes. The inhabitants are very poor. They live chiefly by pasturage—rearing camels, of which their chief agricultural stock consists, and horses of a fine breed, which fetch good prices. From the wool which their sheep yield they manufacture every article of native dress and good blankets. The other industries are leather work, sugar-refining, goldsmith's work, ivory carvings, brass and copper work, weaving, dyers, and carpenters. The principal towns are Bikanir, the capital, Churu, Rajgarh, Ratangarh and Reni. In 1901 the population was 282,627, showing a decrease of 30% due to the results of famine. The revenue is £141,000. The military force consists of 500 men, besides the Imperial Service Corps of the same strength. The schools include a high school affiliated to the university of Allahabad, a school for the sons of nobles, and a girls' school called after Lady Elgin. The railway from Jodhpur has been extended towards Bhatinda in the Punjab, and Bikanir is linked with the British Rajputana, Roheth, Rajputa, and sixth son of Rao Jodha, chief of Marwar, started out to conquer the country. By taking advantage of the rivalries of the clans he succeeded; in 1485 he built the small fort at the capital which still bears his name, and in 1488 began the building of the city itself. He died in 1504, and his successors gradually extended their possessions. In the reign of Akbar the chiefs of Bikanir were esteemed among the most loyal adherents of the Delhi empire, and in 1570 Akbar married a daughter of Kalyan Singh. Kalyan's son, Rai Singh, who succeeded him in 1571, was one of Akbar's most distinguished generals and the first ranger of Bikanir; his daughter married the emperor Jahangir. Two other distinguished chiefs of the house were Karan Singh (1631-1660), who in the struggle of the sons of Shah Jahan for the throne threw in his lot with Aurangzeb, and his eldest son, Anup Singh (1660-1668), who fought with distinction in the Deccan, was conspicuous in the capture of Golconda, and earned the title of maharaja. From this time forward the history of Bikanir was mainly that of the wars with Jodhpur, which raged interminably throughout the 18th century. In 1802, during one of these wars, Elphinstone passed through Bikanir on his way to Kabul and the maharaja, Surat Singh (1758-1828), applied to him for British protection, which was, however, refused. In 1815 Surat Singh's tyranny led to a general rising of his thakurs, and in 1816 the maharaja again applied for British protection. On the 9th of May 1818 a treaty was concluded, and order was restored in the country by British troops. Ratan Singh, who succeeded his father in 1828, applied in vain in 1830 to the British government for aid against a fresh outbreak of his thakurs; but during the next five years dacoity became so rife on the borders that the government raised a special force to deal with it (the Shakhawati Brigade), and of this for seven years Bikanir contributed part of the cost. Henceforth the relations of the maharajas with the British government were increasingly cordial. In 1842 Ratan Singh supplied camels for the Afghan expedition; in 1844 he reduced the dues on goods passing through his country, and he gave assistance in both Sikh campaigns. His son, Sardar Singh (1851-1872), was rewarded for help given during the Mutiny by an increase of territory. In 1868 a rising of the thakurs against his extortion led to the despatch of a British political officer, by whom affairs were adjusted. Sardar Singh had no son, and on his death in 1877 his widow and principal ministers selected Dungar Singh as his successor, with the approval of the British government. The principal event of his reign was the rebellion of the thakurs in 1883, owing to an attempt to increase the dues payable in lieu of military service; this led to the permanent location at Bikanir of a British political agent. Dungar Singh died in 1887 without a son; but he had adopted his brother, Ganga Singh (b. 1886), who succeeded as 21st chief of Bikanir with the approval of the government. He was educated at the Mayo College, Ajmer, and was in command of the 6th Punjab Infantry. He attended King Edward's coronation in 1902, and accompanied the British army in person in the Chinese campaign of 1901 in command of the Bikanir Camel Corps, which also did good service in Somaliland in 1904. The state owes to this ruler the opening up of new railways across the great desert, which was formerly passable only by camels, and the tapping of the valuable coal deposits that occur in the territory. For his conspicuous services he was given the Kaiser-i-Hind medal of the first class, made an honorary major in the Indian army, a G.C.I.E., a K.C.S.I., and G.C.M.G. to the prince of Bikanir.

BILASPUR, a town and district of British India in the Chhattisgarh division of the Central Provinces. The town is situated on the right bank of the river Arpa. It is said to have been founded by a fisherwoman named Bilasa in the 17th century, and it still retains her name. The place, however, came into note only after 1741, the year of the Mahatta invasion (see below), when a Mahatta official took up his abode there and began to build a fort which was never completed. In 1862 it was made the headquarters of the district. The population in 1901 was 18,937. It is an important junction on the Bengal-Rajputana railway, where the two lines from the west meet on their way to Calcutta, 255 m. from Nagpur. The District of Bilaspur has an area of 7522 sq. m. It forms the upper half of the basin of the river Mahanadi. It is almost enclosed on the north, west and east by ranges of hills, while its southern boundary is generally open and accessible, well cultivated, and closely dotted with villages embedded in groups of fruit trees. The principal hills are—(1) the Maikal range, situated in the north-western extremity of the district; (2) a chain of hills forming part of the Vindhyan range, on the north; (3) the Korba hills, an off-shoot of the Vindhyas, on the eastern boundary, and (4) the Sonakhel block of hills, in the vicinity of the Mahanadi river. The Mahanadi is the principal river of the district, and governs the whole drainage and river system of the surrounding country. It takes its rise in a mountainous region which is described as the wildest of all wild parts of the Central Provinces, crosses the Bilaspur boundary near Secorinar, and after a course of 25 m. in the south-eastern extremity of the district enters Sambalpur district. Within Bilaspur the river is everywhere navigable for six months in the year. Minor rivers are the Sakri, Hamp, Tesa, Agar, Maniari, Arpa, Khanor, Lilagar, Jonk and Bareri. The most important affluents of the Mahanadi are the Seonath and Hasdu. Besides the natural water supply afforded by the rivers, Bilaspur abounds in tanks. There are large forest areas, those belonging to the government covering over 600 sq. m. Sal (Shorea robusta) is the chief timber tree.
BILBAO

Bilaspur, which was formerly a very isolated tract, is now traversed in three directions by lines of the Bengal-Nagpur railway. It suffered severely from the famine of 1866-1867. In 1891, the annual death-rate was as high as 90 per thousand, rising to 278 in Bilaspur town. It suffered no less severely in 1900, when in May the number of persons relieved rose to one-fourth of the total population.

In 1901 the population was 1,012,972, showing a decrease of 13%, compared with an increase of 14% in the preceding decade. In 1906, however, the new district of Drug was formed, which took away 739 sq. m. from Bilaspur; the population on this reduced area of Bilaspur in 1901 was 917,240.

Among the Hindu inhabitants of the district, the Chamars and Pankas deserve particular notice. The former, who form the skin-maker and leather-dealing caste of the Hindu community, had always been held in utter contempt by the other Hindu castes. But between 1820 and 1830 a religious movement, having for its object their freedom from the trammels of caste, was inaugurated by a member of the caste, named Ghasi Das, who preached the unity of God and the equality of men. Ghasi Das gave himself out as a messenger of God; he prohibited the adoration of idols, and enjoined the worship of the Supreme Being without any visible sign or representation. The followers of the new faith called themselves Satnamis, or the worshippers of Satnam, and, while they did not completely renounce the Hindu religion, they defied the contempt of the Brahmans. Ghasi Das, the founder of the faith, was their first high priest. He died in 1850; his son succeeded him, but was assassinated (it was said by the Hindus), and the grandson succeeded him. The Pankas, who form about a sixth of the population, are all Kabirpanthis, or followers of Kabir, a religious reformer of the 15th century. There is no great difference between the Kabir Pankas and the Satnamis. They both abstain from meat and liquor, marry at the age of puberty, ordinarily celebrate their circumcision, and the agency of the elders of their own caste and bury their dead. The Pankas worship the Supreme Being under the name of Kabir, and the Chamars under the name of Satnam; while each community has a high priest to whom reverence is paid. At present the majority of the Pankas are cultivators, though formerly all were weavers. The Gonds are the most numerous among the aboriginal tribes, but so great an intermixture has taken place between them and the Hindu races that they have lost their language and most of their ethnical characteristics, such as the flat forehead, squint nose, prominent nose, dark skin, &c., and are scarcely distinguishable from the other classes of the Hindu inhabitants. In addition to some of the Hindu deities which they worship, the Gonds have their own gods—Bara Deva and Dula Deva. The Kanwars are the next largest section of the aboriginal population. The upper class among them claim to be Rajputs, and are divided into numerous septs. Although an aboriginal tribe, the census returns them as a Hindu caste. All the northern landlords of Bilaspur belong to this tribe, which consequently occupies an influential position.

The chief wealth of the district consists in its agricultural produce. Rice, wheat, pulses, millet, mustard, oil-seeds and cotton are the chief crops. Rice, the chief export, is sent to Bombay, Berar and northern India. The tussur silk industry is of considerable importance, and the silk is reputed the best in the Central Provinces. Sal and other timber is exported. Lac is sent in large quantities to Calcutta and Mirzapur. Coal and iron are the chief minerals; sandstone for building purposes is quarried near Bilaspur and Scornarain. Among local industries the most important is the weaving trade.

The early history of the district is very obscure. From remote ages it was governed by kings of the Haihai dynasty of Ratanpur and Raipur, known as the Chattisgarh rajas, on account of thirty-six fort (garhs), of which they were the lords. A genealogical list of kings of this dynasty was carefully kept up to the fifty-fifth representative in the year 1741, when the country was seized without a struggle by the Mahrattas of Nagpur. From 1818 to 1830 Bilaspur came under the management of the British government, the Maharatta chief of Nagpur being then a minor. In 1854 the country finally lapsed to the British government, the chief having died without issue. During the Sepoy mutiny a hill chief of the district gave some trouble, but he was speedily captured and executed.

BILBAO, formerly sometimes written Bilboa, the capital of the province of Biscay, in northern Spain; in 43° 15' N. and 2° 45' W.; on the river Nervión on Ansa (in Basque Ibaizabal), and about 8 m. inland from the Bay of Biscay. Pop. (1900) 83,306. Bilbao is one of the principal seaports of Spain, and the greatest of Biscay towns. It occupies a small but fertile and beautiful valley, shut in by mountains on every side except towards the sea, and containing the fortified haven of Portu- ville, which was fortified in the 8th century. For a long time no carts or carriages were permitted to enter the city for fear of polluting and injuring the pavement, and the transport of goods was carried on in hand-carts. But after 1876 entirely new districts were mapped out on the left bank of the Nervión. Fine broad streets, splendid squares and public gardens, hotels, villas, palatial new public buildings and numerous schools came into existence. The part of the town on the right bank is, however, still the great business centre of the town, and the narrow streets containing the best shops.

There, too, are the banks, the town hall, the theatre, the principal clubs, and the principal churches, including that of Santiago, which dates from the 14th century. In and around Bilbao there are more than thirty convents and monasteries, and at Olaveaga, about a mile off, is the Jesuit university, attended by 850 students. Public education is not, however, entirely in the hands of the priesthood and nuns; there are an institute, a normal school to train teachers, a school of arts and handicrafts, a nautical school and numerous public primary schools for both sexes.

Few Spanish cities grew so rapidly in size, importance and wealth as Bilbao in the latter half of the 19th century. Its first bank was founded in 1857; its first railway (Bilbao-Tudela) was opened in 1867, and the next in 1893. The town, which had been neglected by the Carlist rebellion of 1870-1876, and the contemporaneous decline of its wool and shipbuilding industries, its prosperity increased steadily. The population, 17,649 in 1875, rose to 50,734 in 1887, 74,076 in 1897, and 83,306 in 1900. This development was due principally to the growth of the mining and metallurgical industries. From a very early period, the Old English word bilbo, "a sword," attests, Bilbao was celebrated for the excellent quality of its steel blades; in modern times it was the national headquarters of the important steel and iron trades of the Basque Provinces. Hence it became the centre of manufacture of all the Basque products, especially the leather-dealing and metallurgical industries, and, as its world board, constituted in 1877, improved the river channel and the bar; made wharves and embankments; lighted the lower reaches of the river by electricity, so as to allow vessels to enter by night; and constructed a breakwater and counter-mole outside the bar of the river Nervión, between Santurce, Portugalete and the opposite headland at the village of Algorta, so as to secure deep anchorage and easy access to the river. The first dry dock was constructed in 1896; in 1905 it was supplemented by another, the largest in Spain. The exports are chiefly iron; the imports coal; large quantities of wood from Navarre and the Elbro valley are also sent abroad, and the importation of timber of all kinds from Scandinavia and Finland, and coastwise from Asturias, is of great importance. In the coasting trade the exports are mostly pig-iron, codfish and some products of local industries and agriculture. The shipping
at Bilbao is mainly Spanish, owing to the multitude of small vessels employed in the coasting trade; but from 1880 onwards the majority of foreign ships were British. In 1904, 3319 vessels of 2,207,957 tons were accommodated at Bilbao; more than 2000 were Spanish and nearly 700 British. In the same year new harbour works and lighting arrangements were undertaken on a large scale, and a movement was initiated for the revival of shipbuilding. Besides the mining and metalurgic industries, Bilbao has breweries, tanneries, flour mills, glass works, brandy distilleries, and paper, soap, cotton and mosaic factories.

Bilbao, or Belvao, as it was often called, was founded by Don Pedro Lopez de Haro about 1300, and soon rose into importance. It was occupied by the French in 1795, and from 1808 to 1813; and in 1833 and 1854 it was unavailingy besieged by the Carlists.

BILBEIS, or BILFINGER, a town of lower Egypt, on the eastern arm of the Nile, 36 m. N.N.E. of Cairo by rail. Top. (1907) 13,485. The Coptic name, Phhelbes, seems to have been derived from Egyptian, but nothing is known of the place before medieval times. Considered the bulwark of the kingdom on that side, Bilbeis was by the Moslems defended with strong fortifications. In 1163-1164 it was besieged for three months by the crusaders under Amalric, and in 1168 was captured and pillaged by another army of crusaders. Napoleon in 1798 ordered the restoration of the fortifications, but they have again fallen into decay. Bilbeis was the first halting-place of the English cavalry in their march on Cairo after the flight at Tel-el-Kebir on the 15th of August 1801.

BILBERRY. BILBERRY (Psoralea), or Whorl-eye Berries, known botanically as Vaccinium myrtillus (natural order Ericaceae), a low-growing shrub, found in woods, copses and on heaths, chiefly in hilly districts. The stiff stems, from half a foot to two feet long, bear small ovate leaves with a serrate margin, and small, globose, rose flowers tinged with green. The berries are dark blue, with a waxy bloom, and about one-third of an inch in diameter; they are used for tarts, preserves, &c. The plant is widely distributed throughout the north temperate and extends into the arctic zone. Cowberry is a closely allied species, V. Villosa (L.), growing in similar situations, but not found in the south-eastern portion of England, distinguished by its evergreen leaves and red acid berry.

BILBO (from the Spanish town Bilbao, formerly called in English "Bebeo," and famous, like Toledo, for its sword-blades), in the earliest English use, a sword, especially one of superior temper. In the plural form (as in Shakespeare's phrase "methought I lay worse than the mutines in the bilboes") it meant the irony into which offenders were put on board ship.

BILDERDJK, WILLEM (1736-1831), Dutch poet, the son of an Amsterdam physician, was born the 14th of September 1736. When he was six years old an accident in his foot incapacitated him for ten years, and he developed habits of continuous and concentrated study. His parents were ardent partisans of the house of Orange, and Bilderdijk grew up with strong monarchical and Calvinistic convictions. He was, says Da Costa, "anti-revolutionary, anti-Barneveldtian, anti-Loevesteinish, anti-liberal." After studying at Leiden University, he obtained his doctorate in law in 1752, and began to practise as an advocate at the Hague. Three years later he contracted an unhappy marriage with Rebecca Woesthoven. He refused in 1795 to take the oath to the new administration, and was consequently obliged to leave Holland. He went to Hamburg, and then to London, where his great learning procured him consideration. There he had as pupil Katharina Wilhelmina Schweickhardt (1776-1839), the daughter of a Dutch painter and herself a poet. When he left London in June 1797 for Braunschweig, this lady followed him, and after he had formally divorced his first wife (1802) they were married. In 1806 he was persuaded by his friends to return to Holland. He was kindly received by Louis Napoleon, who made him his librarian (1808), and eventually president (1810-1811) of the Royal Institute. After the abdication of Louis Napoleon he suffered great poverty; on the accession of William of Orange in 1813 he hoped to be made a professor, but was disappointed and became a history tutor at Leiden. He continued his vigorous campaign against liberal ideas to his death, which took place at Haarlem on the 18th of December 1831.

A picture of the Bilderdijk household is given in the letters (vol. v. 1830) of Robert Southey, who stayed some time with Bilderdijk in 1829. "Monsieur Bilderdijk had translated Roderick the Fortified into Dutch (1827-1829)." Bilderdijk's work as a poet see Dutch Literature. His many-sided activity showed itself also in historical criticism—"Geschiedenis van de Vaderslands (1823-1851, 13 vols.), a conservative commentary on Wagenaar's "Vaderslandsche Historie;" in translations from Sophocles (1770 and 1780), of part of the Iliad, of the hymns and epigrams of Callimachus, and from the Latin poets; in philology—"Dael en Dichtkundige Verscheidenheden (1829-1825, 4 vols.); and in drama—the tragedies, Floris de Vijeide (1808), Willem I. van Holland (1808), and others. His most important poetical works are the didactic poem, De Ziekte der geleeren ("The Disease of the Learned"), 2 vols., 1807; a descriptive poem in the manner of D'Ecile in Het Buitenleven (1803); and his fragmentary epic, De Ondergang der eerste wereld (1826). Other volumes were Mijne Verovertiging (Leiden, 1781), Bloemtjes (1785), Mengel-poezie (1790, 2 vols.), Poezie (1803-1807, 4 vols.), Mengelingen (1804-1808, 4 vols.), Nieuwe Mengelingen (1806, 2 vols.), Hollands Verblassing (1813-1814, 2 vols.), Vaderslandsche Uitvoezeningen (Leiden, 1813), Winterbloemen (1811, 2 vols.), &c., in some of which his wife collaborated.

His poetical works were collected by I. da Costa (Haarlem, 1856-1859, 16 vols.), with a biography of the poet. See also "Mijne Levendbeschrijving" in Mengeltingen en Fragmenten ... (1833); his Briefen (ed. 1836-1837) by L. da Costa and W. Messens; Dr. R. A. Kollewijn, Bilderdijk, Zijn Leven en werken ... (2 vols., 1891).

BILEJIK (Byzantine Belome), chief town of the Ertoghul sanjak of the Brusa vilayet in Asia Minor, altitude 900 ft., situated on a hill 2½ m. from its station on the Ismid-Anogra railway. Pop. 10,500 (Moslems, 7200; Christians, 3300). It is an important centre of the silk industry, and has several silk-spinning factories.

BILFINGER (Bilfinger), GEORGE BERNHARD (1603-1752), German philosopher, mathematician and statesman, son of a Lutheran minister, was born on the 23rd of January 1603, at Kanstatt in Wurttemberg. As a boy he showed great aptitude for study, and at first devoted himself to theology, but under the influence of Wolff's writings he took up mathematics and philosophy on the lines of Wolff and Leibnitz. Returning to theology, he attempted to connect it with philosophy in a treatise, Dilectationes philosophicae, de deo, anima humana, mundo (Tübingen, 1725, 1746, 1768). This work, containing nothing original, but giving a clear representation of Wolff's philosophy, met with great success, and the author was appointed to the vacant of preacher at the castle of Tübingen and of reading the school of theology. In 1721, after two years' study under Wolff, he became professor of philosophy at Halle, and in 1724 professor of mathematics. His friends at Tübingen disapproved his new views, and in 1725, on Wolff's recommendation, he was invited by Peter the Great to lecture in St Petersburg, where he was well received. His success in winning the prize of a thousand crowns offered for a dissertation on the cause of gravity by the Academy of Sciences of Paris secured his return to his native land in 1731. In 1735, largely on account of his knowledge of military engineering, Duke Charles Alexander (1733-1737) made him a privy councillor, but his hands were tied owing to the frivolous atmosphere of the court. On the death of the duke, however, he became a member of the Regency Council, and devoted himself with energy and success to the reorganization of the state. In the departments of education, state-religion, agriculture and commerce, his administration was uniformly successful, and he became in a real sense the head of the state. He died at Stuttgart on the 18th of February 1750. After his return from Russia, he won the highest respect at home and abroad, and Frederick the Great is recorded to have said of him, "He is a great man whom I shall ever remember with admiration."
BILGE—BILL

Beside the Dilucidationes, he wrote—De harmonia animi et corporis humani commentatio (Frankfort and Leipzig, 1735; Tübingen, 1741); De origine et permissione mali (1724), an account of the Leibnizian theodicy.

BILGE (a corruption of bulge, from Fr. bouge, Lat. bulga, a bag, deriving probably from an original Celtic word), the "belly" or widest part of a cask; the broad horizontal part of a ship's bottom above the keel; also the lowest interior part of the hull; hence "bilge-water," the foul water which collects in the bilge. "Bilge-keels" are pieces of timber fastened to the bottom of a ship to reduce rolling (see SHIPBUILDING).

BILHARZIOSIS. In various parts of Africa the inhabitants are liable to suffer from a form of endemic haematuria caused by the presence of a parasite in the mucous membrane of the urinary passages. This parasite was discovered in 1852 by Bilharz, and hence is generally known as Bilharzia, though it has been more scientifically named Schistosoma haematobium. The condition to which it gives rise is that of bilharziosis. (For description and life history of the parasite see Trematodes.) In man the parasites and ova have been found in the minute veins of the bladder, ureter and pelvis of the kidney (more rarely in other organs), where they infest the mucus and submucous tissue. In an affected individual the mucous membrane presents swollen vascular patches of varying size, and warty prominences on which the urinary salts may be deposited. The ova often serve as a nucleus for urinary calculi. Similar changes may take place in the ureter, and the consequent swelling lead to obstruction to the passage of urine, and if left untreated to pyelitis and pyonephrosis. If the rectum be affected the mucous membrane becomes thickened, polyoid growths form and large submucous haemorrhages may take place.

As to the mode of entrance of this parasitic opinion is divided. Some authorities favour the view that the entrance is through the skin, urethra or rectum, the result of bathing in infected water; others that it is taken by the mouth in water or uncooked fish. The symptoms to which it gives rise are haematuria, pain in the perineal region and a greater or less degree of anaemia through loss of blood. If the disease continue, cystitis and its consequent train of symptoms ensue (see BLADDER AND PROSTATE DISEASES). If the rectum be affected there is considerable discharge of mucus, and later prolapus anus may be the result. But the symptoms vary to a remarkable extent, from the slightest production of little discomfort, to the most severe, resulting in death. The liquid extract of male fern is the only drug used with much success. The symptoms caused by the parasite must be treated as they arise. Polyoid growths of the rectum must be surgically treated.

BILIN (Czech Bilina), a town of Bohemia, Austria, 90 m. N. of Prague by rail. Pop. (1900) 7871, chiefly German. It is a very old town situated on the Biela, and contains a 17th-century castle, belonging to Prince Lobkowitz. In the vicinity of the towns are extensive lignite mines. Bilin is famous for its mineral springs, the Biltiner Sauerbrunnen. They have a temperature of 45° F. and contain a large proportion of bicarbonates of soda. About 4,000,000 bottles of water are exported annually, and another article of export is the salt recovered from the water by evaporation. About 5 m. to the S. of the Sauerbrunnen lies the Boten or Biltiner Stein (1763 ft.), a large mass of phonolite or clinkstone, with rare flora and fine view. The town is indeed surrounded by basaltic rocks, the largest of them being the Kadelstein (2460 ft.), from which a fine view is obtained.

BILL. There are three words in English with distinct meanings and derivations. (1) A written, originally sealed, document. The word is derived from the Early English bille, Anglo-Latin bilba, from Lat. bulla, in the medieval sense of "seal." It is a doublet, therefore, of "bull." (2) A common Teutonic word for a long-handled cutting weapon (O. Eng. biil, billes, sword or falchion, O. Sax. bill, M.H.G. Bil, Mod. Ger. Bille, a pickaxe; no connexion with Ger. Beil, an axe), of which the name and shape is preserved in the hedging-bills used for pruning hedges and lopping the branches of trees. For an account of the weapon see (2) below. (3) The back of a bird. This may be connected with (2), but it does not appear in any Teutonic language other than English.

(1) In the sense of a document the word is used in various connexions in law and commerce.

In the English parliament, and similar legislative bodies, a bill is a form of statute (q.v.) submitted to either house, which when finally passed becomes an act. The modern system of legislating by means of bill and statute appears to have been introduced in the reign of Henry VI., superseding the older mode of proceeding by petitions from the Commons, assented to by the king, and afterwards enrolled by the judges. A bill consists of a preamble, recalling the necessity for legislation, and clauses which contain the enactments. (For procedure see PARLIAMENT.)

A Bill in Chancery, in former days, in English law, was a written statement of the plaintiff's case whereby he complained of the wrong upon which the suit was based and prayed for relief. By the Judicature Acts 1873 and 1875 its place was taken by a writ and statement of claim (see PLEADING).

A Bill of Indictment is a presentment against a prisoner, charging him with an offence, and presented at quarter sessions or assizes to the grand jury (see INDICTMENT). A Bill of Costs is an account setting forth the charges and disbursements incurred in the conduct of the defendant's business. The delivery of a bill of costs is by statute a condition necessary before the solicitor can sue upon it (see COSTS).

A Bill of Exceptions was formerly a statement in writing of objections to the ruling of a judge, who, at the trial, had mistaken the law, either in directing the jury, or in refusing or admitting evidence or otherwise. The bill of exceptions was tendered at any time before the verdict by counsel of the disappointed party, who required the judge to seal it. The case proceeded to the jury, and judgment being given, the point raised was brought before a court of error. Bills of exceptions were confined to civil cases. They were abolished by the Judicature Act 1875, and a "motion for a new trial" substituted (see TRIAL).

A Bill of Health is a document given to the master of a ship by the consul or other proper authority of the port from which he clears, describing the sanitary state of the place. A bill of health may be either "clean," "suspected" or "touched," or "foul." A "clean" bill imports that at the time the ship sailed, no disease of an infectious or contagious kind is known to exist; a "suspected" or "touched" bill, that no such disease has as yet appeared, but that there is reason to fear it; a "foul" bill, that such a disease actually exists at the time of his tenant's business. The delivery of a bill of costs is by statute a necessary before the destination of the ship is a country whose laws require the production of such a bill before the ship is allowed into port, and where, in default of such production, the ship is subjected to quarantine.

A Bill of Mortality in England was a weekly return issued under the supervision of the company of parish clerks showing the number of deaths in a parish. During the Tudor period England suffered much from plague, and various precautionary measures became necessary. Quarantine or isolation was the most important, but to do this satisfactorily it was necessary to have early warning of the existence of plague in each parish or house. For this purpose searchers—usually women—were appointed, who reported to the clerk the cause of each death in the parish. He, in turn, sent a report to the parish clerks' hall, from whence was issued weekly a return of all the deaths from plague and other causes in the various parishes, as well as a list of those parishes which were free from plague. Bills of mortality are usually said to date from 1538, when parish registers were established by Cromwell (Lord Essex), but there is extant a bill which dates from August 1535, and one which is possibly even earlier than this. It is certain that they first began to be compiled in a recognized manner in December 1603, and they were continued regularly from that date down to 1842, when under the
Births and Deaths Registration Act 1836 they were superseded by the registrar-general's returns. It was not till 1728, when the ages of the dead were first introduced, that bills of mortality acquired any considerable statistical value. It was on the data thus furnished that the science of life insurance was founded.

A Bill of Particulars was, in law, a statement in writing, informing each party of the precise nature of the case they had to meet. It contained the plaintiff's cause of action or the defendant's set-off. Particulars are now usually indorsed on the pleadings (see PLEADING).

A Bill of Peace is, in equity, a suit brought by a person to establish and perpetuate a right which he claims, and which from its nature may be controverted by different persons at different times and by different actions; or where several attempts have already been unnecessarily made to overawe the same right, and justice requires that the party should be quieted in the right if it is already sufficiently established. Bills of this nature were usually filed where there was one general right to be established against a great number of persons, or where one person claimed or defended a right against many, or where many claimed or defended a right against one. Thus, a bill might be filed by a parson for tithes against his parishioners; by parishioners against a parson to establish a modius; by a lord against tenants for an encroachment under colour of a common right; or by tenants against a lord for disturbance of a common right. Bills were also filed in cases where the plaintiff had, after repeated and satisfactory trials, established his right at law, and yet was in danger of further litigation. In such cases, the plaintiff could recover his costs of the action, and in his right from new attempts to controvert it. Actions in the nature of bills of peace are still maintainable.

A Bill of Sight is a document furnished to a collector of customs or other proper officer by an importer of goods in England, who, being unable for want of full information to make a perfect entry of goods consigned to him, describes the same to the best of his knowledge and information. The goods may then be provisionally landed, but perfect entry must be made within three days by indorsing on the bill of sight the necessary particulars. In default of perfect entry within three days the goods are taken to the king's warehouse, and if perfect entry is not made within one month and all duties and charges paid, they are sold for payment thereof. See the Customs Consolidation Act 1876.

A Bill of Store is a license granted by the custom-house to re-import British goods into the United Kingdom. All British goods re-imported into the United Kingdom are entered as foreign, unless re-imported within ten years after their exportation and unless the property in the goods continues and remains in the person by whom they were exported. But in such case they may be entered as British goods, by bill of store, with the exception of corn, grain, meal, flour, malt, and seed. A bill of Visiting or Visiting Bill, in its original meaning, is a list of all stores for shipment, but now an order from an export officer of the customs for the shipment from a bonded warehouse or for drawback of such stores as may be required and allowed with reference to the number of the crew and passengers on board a ship proceeding on an oversea voyage. It is made out by the master and countersigned by the collector of customs. Its object is to prevent frauds on the revenue. No such stores are supplied for the use of any ship nor any articles taken on board deemed to be stores unless they are borne upon the visitting bill, and any such stores relanded at any place in the United Kingdom without the sanction of the proper officers of the customs will be forfeited and the master and owner will each be liable to a penalty of treble the value of the stores or £100. A vissitting bill serves as a certificate of clearance when there is nothing but stores on board the ship.

See also Adventure, Attainder, Indemnity, Letter of Credit, Bill of Exchange, Bill of Rights and Bill of Sale; for a bill of lading see AFFREIGHTMENT. (T. A. I.)

(2) In the sense of a weapon, the primitive forms of a bill suggest short scythe-blades or hedgers' bill-hooks mounted on tall staves. In such shape it is found in the hands of the English before the Conquest. English medieval documents make much confusion between the bill and the halberd and other forms of stayed weapons with cutting heads. Before the 15th century the bill had been reinforced with a pike head above the curved blade and another jutting at a right angle from the blade’s back. In this form it became a popular English weapon, the "brown bill" of many ballads. Billmen are not found in the king's host at Crécy and Calais, the last men carrying mauls or short swords, but the Henry VII's contracts for troops do not name the bill, which may be regarded rather as the private man's weapon. But when, in the middle of the 15th century, Walter Strickland, a Westmorland squire, contracts to raise armed men, it is noticeable that more than half his horsemen carry the bill as their chief arm, while seventy-one bowmen are to march on foot with seventy-six billmen. In the 16th century the bill, with the halbert, fell out of use among regular troops, the pike taking their place on account of the longer staff, which made it a better defence against cavalry. It remained during the 17th century as a watchman or constable's weapon, although rudely-fashioned bills were seen in Sedgemoor fight.

BILLAUD-VARENNE, JACQUES NICOLAS (1759-1810), French revolutionist, was the son of an avocat at the parliament of Paris. He was badly brought up by a feeble father, a mother who combined immorality with religion, and a libertine abbé. At nineteen he donned the robe of an Oratorian, but did not take the vows, and busied himself with literature rather than with religion. In 1785 he left the Oratorian college where he was prefect of studies, came to Paris, married and bought a position as a lawyer in the parliament. Early in 1786 he published at Amsterdam a three-volume work on the Despotisme des ministres de la France, and he adopted with enthusiasm the principles of the Revolution.

At the Jacobin club he became from 1790 one of the most violent of the anti-royalist orators. After the flight of Louis XVI. to Varennes, he published a pamphlet, L'Actéboracée, in which he demanded the establishment of a federal republic. On the 1st of July, in a speech at the Jacobin club he spoke of a republic, and the reference called out the stormy decision of the partisans of the constitutional monarchy; but repeating his demand for a republic on the 4th of the same month, the speech was ordered to be printed and to be sent to the branch societies throughout France. In the night of the 10th of August 1792 he was elected one of the "deputy-commissioners" of the sections who shortly afterwards became the general council of the commune. He was accused, though proof is lacking, of having been an accomplice in the massacres in the prison of the Abbaye. Elected a deputy of Paris to the National Convention, he at once spoke in favour of the immediate abdication of the monarchy, and the next day demanded that all acts be dated from the year 1 of the republic. At the trial of Louis XVI. he added new charges to the accusation, proposed to refuse connexion to him, and voted for death "within 24 hours." On the 2nd of June 1793 he proposed a decree of accusation against the Girondists; on the 6th, at the Jacobin club, he outlined a programme which the Convention was destined gradually to realize: the expulsion of all foreigners not naturalized, the establishment of an impost on the rich, the deprivation of the rights of citizenship of all "anti-social" men, the creation of a revolutionary army, the licensing of all officers ci-devant nobles, the death penalty for unsuccessful generals. On the 15th of July he made a violent speech in the Convention in accusation of the Girondists. Sent in August as "representative on mission" to the departments of the Nord and of Pas-de-Calais, he showed himself inexorable to all suspects. On his return he was added to the Committee of Public Safety, which had decreed the arrest en masse of all suspects and the establishment of a revolutionary army, caused the extraordinary criminal tribunal to be named officially "Revolutionary Tribunal" (on the 29th of October 1793), demanded the execution of Marie Antoinette and then attacked Hébert and Danton. Meanwhile he published a book, Les Éléments du républicanisme, in which he demanded a division of property, if not equally, at least proportionally among the citizens. But he became uneasy for his own safety and turned
against Robespierre, whom he attacked on the 8th Thermidor as a "moderate" and a Dantonist. Surprised and menaced by the Thermidorian reaction, he denounced its partisans to the Jacobin club. He was then attacked himself in the Convention for his cruelty, and a commission was appointed to examine his conduct and that of some other members of the former Committee of Public Safety. He was arrested, and as a result of the petition of the 2nd of September of the year 4 (the 1st of April 1795), the Convention decreed his immediate deportation to French Guiana. After the 18th Brumaire he refused the pardon offered by the First Consul. In 1816 he left Guiana and took refuge in Port-au-Prince (Haiti), where he died of dysentery.

In 1821 were published the Mémoires de Billard-Varenne écrits à Port-au-Prince (Paris, 2 vols.), but they are probably forgeries. An account of the history of his youth, titled Le premier âge, composed in 1786, was published in 1888 in the review, La Révolution françaises. The facts of such a life need no comment. See, in addition to histories of the Revolution, F. A. Aulard, Les oracles de la législature et de la convention (2nd ed. 1907) (R. A.).

BILLET. (1) (Like the Fr. billet, a diminutive of bille, a writing), a small paper or "note," commonly used in the 18th and early 19th centuries as a "bill of invitation." A particular use of the word in this sense is to denote an order issued to a soldier entitled him to quarters with a certain person (see BILLETINO). From meaning the official word, the order billet came to be loosely used of the quarters thus obtained, giving rise to such colloquial expressions as "a good billet." Hence arises the sense of "billet" as the destination allotted to anything. On the said of the 10th century, the III. Song of the Tonk mastered has its billet." Another special sense of the word is that of a voting-paper, found in the 17th century, especially with reference to the Act of Billets passed by the Scottish parliament in 1662.

(2) (From the diminutive billelette or billet of the Fr. bille, the trunk of a tree), a piece of wood roughly cylindrical, cut for use as fuel. In medieval England it was used of the club or bludgeon which was the weapon proper to the serf (Du Cange, s. Billaus). The name has been transferred to various objects of a similar shape: to ingots of gold, for example, or bars of iron; and in heraldry, to a bearing of rectangular shape. The term is applied in architecture to a form of ornamental moulding much used in Norman and sometimes in Early English work. It bears a resemblance to small billets of wood arranged at regular intervals in a sunk moulding. In French architecture it is found in early work and there, sometimes, forms the decoration of a string-course under the gutter, with two or three rows of billets.

BILLETING, the providing of quarters (i.e. board and lodgings) for soldiers (see BILLET, 1). Troops have at all times been used in the belligerent and loco resources afforded by the villages on or near their line of march. The historical interest of billeting in England begins with the repeated petitions against it in the reigns of Elizabeth, James I and Charles L., which culminated in the Petition of Right. The billeting of troops was superintended by a civil magistrate of the district to which the troops were sent or through which they passed. The magistrate, who acted under an order from the king, too often spared his friends at the expense of his political or personal opponents. Owing to the abuses to which the system led, it was declared illegal by the Petition of Right 1625, and again by an act of 1679. During the reign of James II, however, orders were frequently issued for billeting, and one of the grievances in the Bill of Rights was the quartering of soldiers contrary to law. On the organization of a standing army after the revolution it was necessary to make legal provision for billeting owing to the deficiency of barrack accommodation, which sufficed only for 5000 men. Accordingly, the Mutiny Act 1689 authorized billeting among the various innkeepers and victualers throughout the kingdom. This statute was renewed annually from 1689 to 1789, when the Army Discipline Act, consolidating the provisions of the Mutiny Act, was passed. This statute was replaced by the Army Act 1861 (renewed annually by a "commencement" act), which contains the provisions by which billeting is now regulated. But modern conditions have practically dispensed with the necessity for billeting; there is extensive barrack accommodation in most parts of the United Kingdom, and, moreover, troops are entrained or sent by sea when the distance to be covered is more than one day's march. In Scotland the provisions as to billeting were assimilated to those in England in 1857, and in Ireland in 1893.

Billiards, an indoor game of skill, played on a rectangular table, and consisting in the driving of small balls with a stick called a cue either against one another or into pockets according to the methods and rules described below. The name probably originated in the Fr. bille (connected with Eng. "billet") signifying a stick. Of the origin of the game comparatively little is known—Spain, Italy, France and Germany all being regarded as probable originators, if not by various authorities. In an American text-book, Modern Billiards, it is stated that Catkire More (Conn Cetchathach), king of Ireland in the 2nd century, left behind him "fifty-five billiard balls, of brass, with the pools and cues of the same materials." The same writer refers to the travels of Anacharsis through Greece, 400 B.C., during which he saw a game analogous to billiards. French writers differ as to whether their country can claim its origin, though the name suggests this. While it is generally asserted that Henrique Devigne, an artist, who lived in the reign of Charles IX., gave form and rule to the pastime, the Dictionnaire universel (Paris, 1611) ascribes its invention to the English. Bouillon in the first work says: "Billiards appear to be derived from the game of bowls. It was anciently known in England; where, perhaps, it was invented. It was brought into France by Louis XIV., whose physician recommended this exercise." In the other work mentioned we read: "It would seem that the game was invented in England." It was certainly known and played in France in the time of Louis XI. (1423-1483). Strutt, a rather doubtful authority, notwithstanding the reputation attained by his Sports and Pastimes of the People of England, considers it to have been introduced into the ancient game of Paille-maille (Billiard Hall) on a table instead of on the ground or floor—an improvement, he says, "which answered two good purposes: it precluded the necessity of the player to kneel or stoop exceedingly when he struck the bowl, and accommodated the game to the limits of a chamber." Whatever its origin, and whatever the manner in which it was originally played, it is certain that it was known in the time of Shakespeare, who makes Cleopatra, in the absence of Anthony, invite her attendant to join in the pastime—"Let us to billiards: come, Charmian." Ant. and Cleo. Act ii. sc. 5.

In Cotton's Compleat Gamester, published in 1674, we are told that this "most gentle, cleanly and ingenious game" was first played in Italy, though in another page he mentions Spain as its birthplace. At that date billiards must have been well enough known, for we are told that "for the excellence of the recreation, it is much approved of and played by most nations of Europe, especially in England, there being few towns of note therein which hath not a public billiard table, neither are they wanting in many noble and private families in the country." The game was at that time played in something like modern croquet, a long, narrow, round, white, wooden ball, about 4 in. in diameter and in wire loops somewhat smaller in diameter than the wooden balls (one for each player), which were of such a size as barely to pass through the ring. In modern times such games as billiards have afforded scope for various imitations and modifications of this sort.
introduced into Europe from the Orient by the Crusaders. The ball was rolled or struck with a mallet or cue (with the latter, if Strutt’s allusion to “inconveniences” is correct) through hoops or rings, and these were reproduced for indoor purposes on a billiard-table, as well as a “king” or pin which had to be struck. In the original tables, which were square, there was one pocket, a hole in the centre of the table, as on a bagatelle board, the hoop or ring being retained. Then came similar pockets along one of the side cushions sunk in the bed of the table; and eventually the modern table was evolved, a true oblong or double-square, with pockets opening in the cushions at each corner, and in the middle of each long side. The English tables are of this type, small bags of netting being attached to the pockets. The French and American game of billiards is played on a pocketless table. We shall deal first with the English game.

**English Billiards**

The English table consists of a framework of mahogany or other hard wood, with six legs, and strong enough to bear the weight of five slabs of slate, each 23 ft. wide by 6 ft. 13 in., and about 2 in. thick. These having been fitted together with the utmost accuracy to form a level surface, and a green cloth of the finest texture having been spread over it, the cushions are screwed on, and the pockets, for which provision has been made in the slates, are adjusted. As the inside edge of the cushion is not perpendicular to the bed of the table, but is bevelled away so that the top overlaps the base by about 1/4 of an in., the actual playing area of the table is 6 ft. wide but is 1/2 in. short of 12 ft. long. The height of the table is 2 ft. 8 in. measured from the floor to the cloth. The cloth is in the shape shown in the diagram.

The three spots are on the centre line of the table, and are usually marked by small circular pieces of black tissue paper or coar plaster; sometimes they are small medallions of ivory. The Baulk line and the D are marked either with chalk, tailors’ pipeclay, or an ordinary lead pencil; no other marks appear on the table. Smaller tables provide plenty of practice and amusement, provided that the relation of the length to the breadth be observed. On these tables full-sized balls may be used; the pockets being made slightly larger than in the full-size table.

The early part of the 19th century the bed of the table was made of wood, occasionally of marble or stone; green baize was used to cover both the bed and the cushions, the latter being made of leather. Now the cushions proper were glued to a wooden framework which is screwed on to the bed of the table. The old list cushions consisted of 15 lbs. of India-rubber was substituted, the value of the improvement being somewhat modified by the fact that in cold weather the rubber became hard and never recovered its elasticity. Vulcainite resisted the cold, but was not “fast” enough, i.e., did not permit the ball to rebound quickly; but eventually a substance was invented, practically proof against cold and sufficiently elastic for all purposes. Late in the 19th century pneumatic cushions were tried, tubes into which air could be pumped, but they did not become popular, though the so-called “acoustic,” “vacuous” cushions give good results. The shape of the face of the cushion has gone through many modifications, owing to the difficulty experienced in the accurate striking of the ball when resting against the cushion with only a small fraction of its surface offered to the cue; and modern cushions are now made which expose nearly half of the upper part of the ball.

On the size and shape of the pockets depends the ease with which the players score. The mouth of the pocket, known as the fall or “drop,” is part of the middle being larger than the case of the corner pockets than in that of the middle pockets; the cushions are cut away to admit the passage of the ball. The corner pockets are measured by the length of the tangent drawn at the outside point of the arc to the cushion on either side. The middle pockets are measured at the points where the arc terminates in the cushions. The fall of the middle pockets, i.e., the outside point of the arc, is on the line of the outside face of the cushion; that of the corner pockets is half way down the passage cut in the cushions.

*From 1870 to 1885 matches for the championship were played on “American” or “Pyramid” tables, i.e., pocketless tables, measuring about 4½ ft. fall." The tables in ordinary use have 31-in. or 33-in. pockets, but in the "Standard Association Tables," introduced by the Billiard Association at the end of the 19th century, the 31-in. pocket was adopted. The full match of 36 frames was divided into four one-hour periods, drawn slightly from the cushion-line. Further, as the shape of the shoulders of the cushion at the pockets affects the facility of scoring, the authorities adopted a new set of rules for determining the pockets, in ordinary tables, whereby requiring greater accuracy on the part of the player. In the championship tables the baulk line was only 28 in. from the cushion, and the radius of the D was reduced to 1½ in. Afterwards to 10 in., the spot being 12½ in. from the top cushion.

The principal games are three in number,—billiards proper, pyramids and pool; and from these a spring a variety of others. The object of the player in each game, however, is either to drive one or other of the balls into one or other of the pockets, or (only in billiards proper) to cause the striker’s ball to come into successful contact with two other balls. The former stroke is known as a hazard (a term derived from the fact that the pockets used to be called hazards in old days), the latter as a cannon. When the striker’s ball is forced into the pockets, the stroke is a "hanging hazard; when the striker’s ball falls into a pocket after contact with the object ball, the stroke is a losing hazard; "red hazards" mean that the red ball is the object-ball, "white hazards" the white.

Three balls are used in billiards proper, two white and one red. One of the white balls has a black spot at each end of an imaginary diameter; the other two balls, the so-called compass ball, are known as spot-white (or "spot") and "plain." They should be theoretically perfect spheres, of identical size and weight, and of equal durability in all parts. The size that is generally used in America is that of a diameter of 2 in., and the weight about 4 oz. It is exceedingly difficult to get three such ivory balls (the best substance for elasticity) except by cutting up many tucks, and when preserved the balls for so lose their perfection, partly because ivory is softer than another part that is subjected to mechanical stress, susceptible to changes of weather and temperature, and unequally susceptible in different parts; it is also liable to slight injury in the ordinary course of play. Various substitutes have, therefore, been tried for ivory (q.v.), such as crystalate, or bonzoline (a cellulosic compound), and even hollow steel; but their elasticity is inferior to that of ivory, so that the ball rebounds in a wider arc than it strikes. The price of a first-rate set of ivory balls is from four to six guineas; the composition balls cost about half a guinea apiece.

The cue is a rounded rod of seasoned ash about 4 ft. 9 in. in length, tapering from the butt, which is about 1½ in. in diameter, to the tip, which is about 1 in. in diameter, and weighs about 4 oz. The average tip is, however, 3 in. in diameter. The cue weighs generally between 14 and 18 oz. The tip of the cue is usually a leather cap made of suede, which, being liable to slip along the surface of the ball in striking, is kept covered with chalk. To the leather tip, the invention of a Frenchman named Mingin (about 1820), and to the control which it gives the player over the ball, the science of modern play is entirely due. The butt of the cue is generally supplied with ebony or some other heavy wood, since a shaft of plain ash is too light for its purpose, and is furthermore liable to warp. At one time it was lawful to use the butt of the cue or even a special instrument with a squared spoon-shaped end called a mace (or mast), in making strokes or giving misses, but now all strokes must be made with the cue. The cue is held in one hand, and with the other the player makes a "bridge" by placing wrist and finger-tip on the table, and extending his thumb so as to make a passage along which to slide his cue and to strike the ball. As it is not always possible to reach the ball in this way, longer cues (the "half-butt" and "long butt") are used. In modern tables, there are used with various sorts of wood at the end of which, perpendicular to the axis, is fastened an X of wood or metal, the cue being rested on the upper half while the lower is in the cloth. A "long butt," about 6 ft. long, is used with the long cues; the "short butt" is the same as the regular cue, with the ordinary cue. A marking-board and stands or racks for rests and butts, with iron and brush for the table, and a cover for the table when not in use occupy the so-called "furniture" of the room, apart from its seating accommodation.

The game of billiards proper consists of the making of winning and losing hazards and canons. It is usually played between two opponents (or four, two against two) for 100 or more points, three being scored for each red hazard, two for each white hazard and two for each canon. Certain forfeitures on the other hand score to the opponent; running your ball off the table or into a pocket without having hit another ball, 3 (a coup); ordinary
## BILLIARDS

**misses (not hitting an object-ball).** All these forfeits involve the termination of the turn. There are also "foul strokes" which score nothing to the opponent, and only involve the termination of the turn: such as playing with the wrong ball, forcing a ball off the table, hitting a ball twice, &c. When the red ball is pocketed it is replaced on the billiard-spot; if that is occupied, on the pyramid-spot; if that too, on the centre-spot; but if the opponent's white ball is pocketed it remains out of play till his turn comes. Public matches between deputies are played for higher points, but the rules which govern them are the same as those of the amateurs, except for "in play" and continuing his "break" until he fails to score.

The game commences by straying for the lead and choice of balls. The players standing behind the baulk line, strike each a ball from the semicircle up to the top cushion, and he whose ball on its return strikes the lowest of the seven balls in order of size of lead and balls. The red ball is placed on the spot at the commencement of the game, and the first player must "break the balls." The balls are said to be "broken" when the first player has struck the red or given a missed; and the opponent's ball when off the table is said to be "in hand." Breaking the balls thus takes place whenever the position, as at the beginning of the game, recurs. The first player (or the player on the left of the game) has the first chance of playing; he must "strike first" a cannon or cushion, and must then (if "in hand") place his own ball in any part of the D, or on the lines that form the D, and must play into the part of the table outside the baulk line, for he may not hit direct any ball that is "in baulk," i.e., on the lines that form the D; he must "strike first" a cushion or cannon, or "strike first" a cannon if "in hand." If a player fails to score, the adversary plays, as soon as all the balls are at rest, either from baulk (if "in hand") or from the place where his opponent left them. If by the adverse balls he makes a scratch, or loses his score, i.e., a cannon and a hazard, or a winning and a losing hazard, he scores for each of them. Thus if he pockets the red ball he scores a point, and holes the red ball, five. In the case of a cannon and a losing hazard, made by the same stroke, the value of the hazard is placed on the ball first struck. Thus if the cue-ball strikes the red cannon, and reduces the chalk pocket to a cannon, only the red ball can be pocketed, but only one cannon can be made by the same stroke, even if the cue-ball strikes each of the others twice. If both object-balls are struck simultaneously, it is considered that the red is struck first. Ten points are the most that can be scored in one stroke. The cue, namely, by striking the red ball first and then the white, and holing all three. If the white ball be struck first and the same series occurs, the value of the stroke is nine points. When the cue-ball and object-ball are touching, whatever the position, the red ball is spotted, the white object-ball put on the centre-spot, and the player plays from baulk.

Various subtleties in the art of striking, which may be indicated, though only practice can really teach them; the simple stroke being one delivered slightly above the centre of the ball.

By striking the object-ball on the side with the point of the cue. The effect of this stroke is to send the ball up, and to make it travel to the right or to the left, according to as it is struck, with a winding or slightly circular motion; and its purpose is to cause the cue-ball to describe a small circle, in a direction towards the edge of the table, and to make it usually, or ordinary, when the ball is struck in or about the centre of its circumference. Many hazards and cannons, quite impossible to be made with the central stroke, are accomplished with ease and certainty by the side-stroke. It was the invention of the "tipp-ex score" which made side possible. The "screw," or twist, is made by striking the ball low down, with a sharp, sudden blow. According to the ball is struck nearer and nearer to the fashion, it stops dead at the point of concussion with the object-ball, or rolls by a series of reversions, in the manner familiar to the schoolboy in throwing forward a hoop, and causing it to return to his hand by the twist given to its first motion. The "follow" is made by striking the ball high, with a flowing or following motion of the cue. Just as the low stroke impedes the motion of the ball, the follow expedites it in the direction of the stroke, without the sudden jerk of the screw, and with less than the onward push of the follow.

The "spot-stroke" is a series of winning hazards made by pocketing the red ball in one of the corners near to the spot. The great art is, first, to make sure of the hazard, and next to leave it in such a position as to enable the player to make a similar stroke in one or other of the corner pockets. To such perfection was the stroke brought by the righthanders at the English billiard tables, that no professional was necessary to bar it out of the professional matches, and the "spot-barred" game became consequently the rule for all players. The learned English professionals so completely mastered the difficulties of the stroke, that the English hazard, which long and long practically killed all public interest in billiards, the game being little more than a monotonous series of spot-strokes. In 1888 W. J. Peal made 633 "spots" in succession, and in 1889 a break of 3304—the longest record—no less than 518 of the possible 6750 through-spot-stroke breaks. J. G. Sala, by use of the screw-back, made 186 successive hazards in one pocket, but C. Memmott is said to have made as many as 423 such strokes in succession. The spot-stroke was known and used in 1825, when a run of twenty-two successive "spots" was made by a player, whose name was Carr, offered to play any man in England, both amateurs and professionals, by Edwin Kentfield never met him, so the latter became champion. Kentfield, however, did not regard the spot-stroke as genuine billiards, and refused to play it. The first play was in 1849 in succession. But W. Cook, John Roberts, jun., and others, assisted by the improvements made in the implements of the game, soon followed the new stroke, and the "spot-stroke" was eventually almost driven from the table. But the second hazard being reduced to 3 in., and the billiard-spot moved nearer to the top of the table, so as to make the stroke exceedingly difficult. John Roberts, sen., who succeeded Kentfield as champion in 1849, worked with a new kind of cue-ball, the spot-stroke, it was said, could never be made in succession. The "natural" and "half-ball" angle. If the balls were flat discs instead of spheres the edge of one ball would touch the other. The object-ball is struck at "three-quarter ball" or "quarter-ball" according as the edge of...
the cue-ball appears to strike mid-way between the half-ball point and the centre or edge respectively of the object-ball. The half-ball angle regarded as the standard angle for both, other angles being sometimes termed rather vaguely as "rather more or less than half-ball." The angle of the cue-ball's new course would be about 45°, were the object-ball fixed, but as the object-ball moves immediately it is struck, the cue-ball is not actually diverted more than 33° from the prolongation of its original course, it being conventional among players to regard the prolongation of the cue-ball's track as the actual strike excepting the angle. The natural angle, and all angles, may be modified by side and screw; the use of strength also makes the ball go off at a wider angle.

**Development in Billiard Play.**—The modern development of English billiards is due mainly to the skill of such leading players as John Roberts, sen., and his son of the same name. Indeed, their careers form the history of modern billiards from 1840 when the elder Roberts challenged Kentfield (who was making a bid for the championship) to a series of matches. Such a comparison can be made between the last-named men, and the change of cushions from list to india-rubber further complicates the question. Kentfield represented the best of the old style of play, and was a most skilful performer; but Roberts had a genius for the game, combined with great nerve and physical power. This capacity for endurance enabled him to practise single strokes till they became certainties, when weaker men would have failed from sheer fatigue; and that process applied to the acquisition of the spot-stroke was what placed him decisively in front of the players of his day until a younger generation taunted him. Roberts regarded the younger generation had caught him up, and soon afterwards surpassed him at this stroke; both W. Cook and J. Roberts, jun., carried it to greater perfection, but they were in turn entirely in the shade by W. Mitchell and W. J. Peall. It is curious to realize that John Roberts, sen., developed the game chiefly by means of spot-play, whereas his son continued the process by abandoning it. The public, however, liked quick scoring and long breaks, and therefore a substitute had to be devised. This was provided chiefly by the younger Roberts, whose fertility of resource and dexterity overcame every obstacle to his advancement. The game thus far comprises only three balls close to each other, say within a space which a hand can cover, and not more than from 4 to 8 in. from a cushion. The striker's ball should be behind the other two, one of which is nearer the cushion, the other a little farther off and farther forward. The striker's ball is tapped quietly on the next one the cushion, and hits the third ball so as to drive it an inch or two in a line parallel to the cushion. The ball first struck rebounds from the cushion, and at the close of the stroke all three balls are at rest in a position exactly similar to that at starting, which is called by the French "pass-throw." The second ball is struck in a manner so that each of the three balls come to rest in the same order as before, the positions of the balls being relatively the same, but actually forming a series of short advances along the cushion. With the pass-stroke a great number of these cannons could be quickly made, say 50 in 3½ minutes; and, as that means 100 points, scoring was rapid. Most of the great spot-barred breaks contained long series of these cannons, and their value as records is correspondingly diminished, for in such hair's-breadth distances very often no one but the player, and sometimes not even he, could tell whether a stroke was made or missed or was foul. Push-barred, the cannons are played nearly as fast; but with most men the series is shorter, mere strokes being used when the cannon cannot be directly played.

**Championship.**—When Kentfield declined to play in 1840, John Roberts, sen., assumed the title, and held the position till 1870, when he was defeated by his pupil W. Cook. The following table gives particulars of championship matches up to 1885:

</table>

These games were played on three-inch-pocket tables, and John Roberts, jun., fairly contented that he remained champion till beaten on such a table under the rules in force when he won the title or under a new code to which he was a consenting party. A match was played for the championship between Roberts and Dawson in 1890 of 18,000 up, level. The main departure from a championship game lay in the table, which had ordinary, though not easy pockets, instead of three-inch pockets. The match excited much interest, because Dawson, who had already beaten North for the Billiard Association championship, was the first man for many years to play Roberts even; but Roberts secured the game by 1813 points. After this Dawson improved materially, and in 1890, for the second time, he won the Billiard Association championship. His position was challenged by Diggle and Stevenson, who contested a game of 10,000 points. Stevenson won by 9205, but lost to Dawson by 2225 points; he beat him in January 1901, and though Dawson won a match before the close of the spring, Stevenson continued to establish his superiority, and at the beginning of 1907 was uncontestably the English champion.

**Records.**—Record scores at billiards have greatly altered since W. Cook's break of 936, which included 292 spots, and was made in 1873. Big breaks are in some degree a measure of development; but too much weight must not be given to them, for tables vary considerably between each other, and the difficulties of the game are apt to be underestimated. Peall's break of 3304 (1890) is the largest "all-in" score on record; and in the modern spot-barred and push-barred games with the championship table, H. W. Kentfield in April 1904 made 758 against C. Dawson. In January 1905 John Rogers, however, made 821 in fifty minutes, in a match with J. Duncan, champion of Ireland; but this was not strictly a record, since the table had not been trained specially in the Association style. A break of 985 was made by Diggle in 1895 against Roberts, on a "standard table" (before the reduction in size of the pockets). On the 5th of March 1907 T. Reece began beating records by means of the "anchor" stroke, making 1290 (521 cannons), and he made an unfinished 4593 with the same stroke (2268 cannons) on the 23rd of March. Further large breaks followed, including 23760 by Dawson on the 20th of April 1907, and even more by Reece; and towards the end of the year the Billiard Association ruled the stroke out.

**Handcapping.**—The obvious way of handicapping unequal players is for the stronger player to allow his opponent an absolute number of points by way of start. Or he may "owe" points, i.e. not begin to reckon his score till he has scored a certain number. A good plan is for the better player to agree to count no breaks that are less than a certain figure. The giving of points scores all forfeits for misses, &c. If A can give B 20 points, and B can give C 25 points, the number of points that A can give C is calculated on the following formula, 20+25−5=10. The handicap of "barring" one or more pockets to the better player, he having only four or five pockets to play into, has been abolished in company with other methods that tended to make the game tedious.

**Pyramids** is played by two men on a table in the latter case in three or two. It is played with fifteen balls, placed close together by means of a frame in the form of a triangle or pyramid, with the apex towards the player, and a white striking ball. The centre of the apex ball covers the second or pyramid
spot, and the balls forming the pyramid should lie in a compact
mass, the base in a straight line with the cushion.
Pyramids is a game entirely of winning hazards, and he who
succeeds in pocketing the greatest number of balls, wins. The
balls may be taken in any order, but their value is either a
red or coloured balls, with the striking
ball white. This white ball is common to both players. Having
decided on the lead, the first player, placing his ball in the baulek-
semitic circle, and his opponent placing his ball on any other
a spot, the white ball is pocketed, provided the player
a ball in a pocket or get to the white safely back to baulek. Should
he fail to pocket a red ball, the other player goes on and strikes
the white ball from the place at which it stopped. When in
making winning hazards he plays at such a point that the ball he chooses
and continues his break till he ceases to score; and so the game
is continued by alternate breaks until the last red ball is pocketed.
The game is considered as finished on the player to whom
the pyramid belongs pocketing all balls on each ball or life—as, for instance, 36, game
and is. balls. The player wins a life by pocketing a red ball or forcing
it over the table; and loses a life by running his own, the white, ball
into a pocket, missing the red balls, or intentionally giving a miss.
In this game the baulek is no protection; that is to say, the player
may pocket any ball wherever it lies, either within or without
the baulek line, and whether the white be hard or not. This liberty
is a great and certain advantage under many circumstances,
especially in the hands of a good player. It is not a very uncommon
occurrence for an adept to pocket six or eight balls in a single break.
This, of course, has not always been permitted. In the old game
there was an upper limit of 15 balls, and 21 in. was considered the
whole fifteen. If four persons play at pyramids, the rotation is
decided by chance, and each plays alternately—partners, as in
billiards, being allowed to advise each other, each going on and con-
tinuing the game as long as he can pocket a red ball without
hazard. Foul strokes are reckoned as in billiards, except as regards
balls touching each other. If two balls touch, the player proceeds
with his game, and a point is made whenever he pockets the red
ball last played at; but if one are pocketed, he who made the last
hazard, has a choice of pocketing the white and his opponent with the red;
and so on alternately, till the game terminates by the holing of one or other
ball. The pyramid balls are usually a little smaller than the billiard
balls; the former are about 2 in. in diameter, the latter 2½ in.
Losing Pyramids. A mode played, is the reverse of the last-named
game, and consists of losing hazards, each player using the same
striking ball, and taking a ball from the pyramid for every losing
hazard. As in the other game, the baulek is no protection. Another
variation is—When a player takes a ball from the baulek, he
may pocket any ball he pleases, and the number of persons may play.
The pyramid is formed as before, and the company play in rotation.
For each winning hazard the striker receives from each player a small stake, and for each losing hazard he
pays a like sum, till the game is concluded, by pocketing the
white or the last coloured ball.
Pool, a game which may be played by two or more persons,
entirely of winning hazards. Each player subscribes a
certain stake to form the pool, and at starting has three chances
or lives. He is then provided with a coloured or numbered ball,
and the game commences thus:—The white ball is placed on the
spot and the red is placed at it from the baulek semicircle. If
the player pocket the white he receives the prize of the red ball and if he
fails, the ball remains with the player; the yellow, red, plays on the red; and so on alternately till all have played, or
till a ball be pocketed. When a ball is pocketed the striker plays on
the ball nearest his own, and goes on playing as long as he
can score.
The order of play is usually as follows:—The white ball is spotted;
red plays upon white; yellow upon red; then blue, brown, green, black,
and spot-white follow in the order of succession named, white
playing on spot-white. The order is similar for a larger number,
but it is not common for more than seven or eight to join in a pool.
The player wins a life for every ball pocketed, and receives the any
agreed sum as in billiards. In playing a life he loses the life to
the owner of the ball he plays on and misses; or by making a
losing hazard after striking such ball; by playing at the wrong ball,
by running a coup; or by forcing his opponent to try the ball he
has pocketed for any other incident. A ball in
baulek may be played at by the striker whose ball is in hand. If
the striker’s ball be angled—that is, so placed in the jaws of the
poole and striking one of the corners, then he may have all the balls except his own and the object ball removed
from the table to allow him to try brieđe from the cushion. In
some clubs and public rooms an angled ball is allowed to be moved
an inch or so on, but with the other balls moved none are turned
or not take a life. When the striker loses a life, the next in rotation
plays on the ball nearest his own; but if the player’s ball happen
to be the last ball pocketed on the object ball, the count is over
the baulek line, whether it be in or out of baulek. In such a case the striker
can play from any part of the semicircle. Any ball lying in the way
of the striker’s ball, and preventing him from taking fair aim
and reaching the obiect-ball must be removed, and replaced after the
stroke. If there be any doubt as to the nearest ball, the distance
must be measured by the striker or umpire; and if the two be
equal, the ball to be played upon must be decided by challenge. If
the striker first pocket the ball he plays on and then runs his own into a
pocket, he loses a life to the player whose ball he pocketed, which
must then be pocketed, or if the lives be even, which
all his three lives can “star”; that is, by paying into the pool a sum
equal to his original stake, he is entitled to as many lives as
he may wish. If he wins a game in this way, he is entitled
number be 2, he stars 2; 1, he stars 1. Only one star is allowed
in a pool; and when there are only two players left in, no star can
be purchased. The price of each life must be paid by the player
losing the game, and secondarily by the remaining players. The
amount of this sum varies from 10 to 20, according to the
pool is finally won by the player who remains longest in the game.
In the event, however, of the two players last left in the pool having
an equal number of lives, they may either play at random or
agree on the method of deciding. The latter is generally followed except when the
combatants agree to play out the game. When three players are
left, each with one life, and the striker makes a miss, the two remaining
divide the pool without playing at pyramids—the remaining
must meet the possible case of two players combining to take advantage
of a third. “When the striker has to play, he may ask which ball he
has to play at, and if being wrongly informed he plays at the wrong
ball, he does not lose a life. In clubs and public rooms it is usual
for the marker to call the order and rotation of play:—“Red upon
white, and yellow’s your player” ; and when a ball has been pocketed
the fact is notified—“Brown upon white, yellow in” ; and so on till there are only two or three players left in
the pool.
There are some varieties of the game which need brief mention.
When the white ball is stopped or pocketed, and the striker
plays for a stake and so much for each of three or more lives.
Each person has a ball, usually white and spot-white. The white
is spotted, and the other plays on it from the baulek semicircle; and the engaged
player is not a spot-white ball, but the white or a white ball.
For each winning hazard the striker receives a life; for each losing hazard he
pays a life; and the taker of the three lives wins the game. No star is
allowed in this single life pool.

Nearst-Ball Pool is played by any number of persons with the
ordinary coloured balls, and in the same order of succession. All
the rules of pool are followed, except that the baulek is a protection.
If the white ball is spotted, and the striker play on it, and his
ball is pocketed, the striker must—play on the black ball. If he pocket it he
receives a stake from each player, paying a stake all round if he misses it; or
comes any of the errors for which he would lose a life in billiards,
the black ball has to be taken in consecutive strokes. Sometimes a pink ball, spotted on the pyramid spot, is added and
a single stake is paid round to the man who pocket it, and a
small stake which the striker must—play on the black ball. If he pocket the
black and pink balls, and at the same time a pink
a

Black Pool. In this game, which lasts for half-an-hour, there are
no lives, the player whose ball is pocketed paying the stake to the
pocket. Each player receives a coloured ball and plays in order as in "Following Pool," the white ball being spotted; there is, in
addition, however, a black ball, which is spotted on the centre-spot.
Should the player have a black ball at the beginning of the game,
must—play on the black ball. If he pockets it he receives a stake from each player, paying a stake all round if he misses it; or
comes any of the errors for which he would lose a life in billiards,
the black ball has to be taken in consecutive strokes. Sometimes a pink ball, spotted on the pyramid spot, is added and
a single stake is paid round to the man who pocket it, and a
small stake which the striker must—play on the black ball. If he pocket the
black and pink balls, and at the same time a pink
a

The pyramid balls, set up as in pyramids, count one point each, the yellow ball two points, green ball, three; the

Billiards is a game in which players must use a cue to hit balls into pockets on a table. The game is played on a baulek

To add more context and richness to the description, consider the following text, which includes the rules and terminology specific to the game's methods and objectives. This text can be a resource for understanding the complexities and intricacies of the games, and how they differ from one another. The text also highlights the unique elements that set billiards apart from other pool games, such as the emphasis on strategy and the importance of maintaining control over the balls. The mention of the pyramid game and its variations illustrate the versatility and adaptability of the rules, allowing players to create new and creative ways to engage in the sport. Finally, the text touches on the social aspects of the games, such as the camaraderie and friendly competition that often accompanies the experience.
BILLIARDS

penalties for missing a ball, running into a pocket, &c., are deducted from the player's score; they correspond to the values of the balls, unless a ball is pocketed, in which case it is valued at $2.50, being the usual value. When the cue is lost, or before hitting the proper ball, the player hits one of a higher value, the value of that ball is deducted from his score, but there is no further penalty. A player is "snookered" if his ball is so placed that it is impossible to play, and he may then be compelled to accept the ball as hit, &c. If the player is snookered, and he is allowed in some rooms to give a miss, but in such a way that the next player is not snookered; in others he must make a break. In English billiard rooms, the practice is the same as in the US, that is, to the usual penalty if in so doing he hits a ball of higher value. In some rooms it is considered fair and part of the game to snooker an opponent deliberately; in others the practice is condemned. The rules regarding the relative value of different balls have often been changed, and the printed rules are not of much value, owing to local by-laws.

Among other games of minor importance, being played in a less serious spirit than those mentioned, are Selling Pool, Noarest Ball Pool and Scale Pool. For Selling Pool, the black ball is used with fifteen balls, each bearing a number. There are several variations of the game, the most popular being Continuous Pool, an expanded form of Fifteen-Ball Pool, in which the first time a player fails to hit the next two highest numbered balls, the game being won by the player pocketing the majority of the fifteen balls, each ball counting one point, the numbers being used only to distinguish them, as a player must always name, or "call," the ball he wishes to hit as he plays the next one. In the game of Selling Pool, each player is provided with fifteen balls, each bearing a number. The player who "breaks" (plays first) must send at least two balls to the cushion or forfeit three points. The usual method is to strike a corner-ball just hard enough to do this but not hard enough to pocket it, in that case the second player would have the great advantage. Balls pocketed by chance in the same play in which a called ball has been legitimately put down are counted; all others pocketed by accident are replaced on the table. In Continuous Pool, the player hitting the red ball first has the option of deciding whether the game shall be Continuous Pool or just a set of points, generally 100, the balls being set up again after each frame and the player pocketing the red ball having the choice whether to break or cause his opponent to do so.

The Cushion Carom game is a variety of the ordinary three-ball game, in which no carom counts unless the cue-ball touches a cushion before or after the play. The game is usually called "Snooker," which is explained by its title, and the Bank Shot game, in which the cue-ball must touch a cushion before it strikes either ball. The Cushion Carom game is usually played in American billiard rooms, and the letter player must make a certain number of caroms or "no count," and for the weaker to receive a number of points in the game.

The game of billiards was played exclusively by the aristocracy and the richer middle class until the first part of the 17th century, when the privilege of keeping billiard-rooms was accorded to the billiarders/paintiers, and billiards became the principal betting game. The game gained so much in popularity that in Philadelphia, other methods of playing them may be found in Billiards (Badminton Library series).

French and American Billiards.—French and American billiards is played on a pocketless table, the only kind of table that is used in France, though the English table with six pockets is also occasionally to be found in America. For match purposes the table used measures 10 ft. by 5 ft., but in private houses and clubs 9 ft. by 4 ft. is the usual size, while tables 8 ft. by 4 ft. are not uncommon. The balls, three in number as in English billiards, measure from 2½ to 3 in. The larger, better white ball is pocketed in; with English billiards, the cue-white ball is pocketed in; with fifteen balls, each bearing a number. There are several variations of the game, the most popular being Continuous Pool, an expanded form of Fifteen-Ball Pool, in which the first time a player fails to hit the next two highest numbered balls, the game being won by the player pocketing the majority of the fifteen balls, each ball counting one point, the numbers being used only to distinguish them, as a player must always name, or "call," the ball he wishes to hit as he plays the next one. In Continuous Pool, the player hitting the red ball first has the option of deciding whether the game shall be Continuous Pool or just a set of points, generally 100, the balls being set up again after each frame and the player pocketing the red ball having the choice whether to break or cause his opponent to do so.

The three-ball carom game is the recognized form of American billiards. The table is marked with a centre-spot, a red spot and a white spot. The first is on the centre of an imaginary line dividing the table longitudinally in half, the red (the cue-ball) and white spots are on the same line, half-way between the centre-spot and the end cushions, the white spot being on the string-line (corresponding to the English baulk-line). The right to play (the English Pool game) is determined in the following manner: the white ball and the red ball being spotted, the player plays from within the imaginary baulk-line. Each carom counts one point; a miss counts one to the opponent. A ball is re-spotted, or its proper spot if it has been forced off the table. Should red be forced off the table and the red and white ball be pocketed, it is placed on the white spot. White under similar conditions is set on the red spot. The centre spot is only used when a ball having been forced off the table, both spots are occupied. If a carom is made, and the ball afterwards jumps off the table, it is spotted and the count is allowed. If the striker moves a ball not his own before he strikes, he cannot count the carom. If he does so, he forfeits one, and his break is ended. If he touches his own ball before he plays, he forfeits a point, and continues his break. Should he fail to touch any ball a second time, the opponent has the option of having the balls re-struck as exactly as possible, or of playing on them as they are left. It is a foul stroke to play with the wrong ball, but if the offence is not discovered before a second break has been made, the player may continue.

Such long runs of caroms, chiefly "on the rail" along the cushion, have been made by professional players (H. Kerkau, the German champion, making 7150 caroms in 1901 at Zurich), that various schemes have been devised to make the game more difficult. One of these is known as the "continuous baulk-line." Lines are drawn, 8, 14, 18 or even 22 in. from the rails, parallel to the side of the table, forming with them eight compartments, the two inner ones being of most general. Only one, two or three caroms, as previously arranged, are allowed to be made in every space, unless at least of the object-balls are driven out of the line. In the case of less, the table any number of caroms may be made without restriction. In the case of the Triangular Baulk-line, the lines are drawn at the four corners from the second "side" on the side-rails to the first sight on the opposite side, and the player in his turn who has not pocketed his own balls, or who pocketed his own ball, should pocket his own ball. The game of Thirty-Four is played without a bottle, the scoring being by caroms or pocketing the two object-balls. Exactly 34 must be scored or the player is "hurt."
BILLY BILLINGTON—BILL OF EXCHANGE

have the same score the High ball wins before the Low, &c., as in the card game of the same title.

The game is played with two white balls, one red and five small pins set up in diamond form in the centre of the table with the pin counting 5 (the king-pin) in the middle, the pins being 3 in. apart. Each player is given a small ball from the bottle and this he keeps secret until he is able to announce that his points, added to the number on his small ball, amount to exactly 31. If he "bursts," he must begin again. Points are made only by knocking down pins, which are scored by applying a player knock down one stroke all four outside pins, leaving the 5 pin standing, it is a "natural" and he wins the game.

Besides these common varieties of pool there are many others which are played in different parts of America, many of them local in character.

Bibliography.—The scientific features of billiards have been discussed at more or less length in several of the following older works: "The Game of Billiards," 1802, this was partly a translation of a French treatise, published in 1805, and partly a compilation from the articles in the Académie universelle des jeux, issued in the same year, and since frequently re-edited and re-printed; "Le Musée des jeux" (Paris, 1826); Monseigneur Minguad, "The Noble Game of Billiards" (Paris, 1834); a translation of the same, by John Thurston (London, 1835); Kettfelfield, "On Billiards" (London, 1839), founded principally on the foregoing works; Edward Russell, "Mardon, Billiards, Game 500 up" (London 1849); Turner, "On Billiards," a series of diagrams with instructions (Nottingham, 1849); Captain Crawford, "The Billiards Book" (Edinburgh, 1855) and "Billiards" (1868); Fred. Hardy, "Practical Billiards," edited by W. Dutton (1860); Joseph Bennett (ex-champion), "Billiards" (1873). These older books, however, are largely superseded by such modern authorities as "The Game of Billiards" (London, 1868); W. Cook, "Billiards" (Burroughs & Watts); J. P. Buchanan, "Hints on Billiards" (Bell & Son); "Modern Billiards" (The Brunswick—Bulke—Collender Co., New York); Broadfoot, "Billiards," Badminton Library (Longmans); Locke, "Side and Screen" (Longmans); M. Vignaux, "Le Billard" (Paris, 1880); A. Howard Cady, "Billiards and Pool" (Spalding's Home Library, New York); Thatcher, "Championship Billiards, Old and New" (Chicago, 1884).

For those interested in the purely mathematical aspect of the game, Hemmings, "Billiards Mathematically Treated" (Macmillan).

BILLINGTON, ELIZABETH (1767–1818). British opera-singer, was born in London, her father being a German musician named Weichsel, and her mother a popular vocalist. She was trained in music, and at fourteen sang at a concert in Oxford. In 1783 she married James Billington, a double-bass player. She had a voice of unusual compass, and as Rosetta in Love in a Village she had a great success at Covent Garden in 1786, being engaged for the season at a salary of £1,000, a large sum for those days. Her position as a singer in London was now assured. In 1794 she and her husband went to Italy, and Mrs Billington appeared at Naples (where she was the heroine of a new opera, Inez di Castro, written for her by F. Bianchi), at Florence, at Venice and at Milan. Her husband died suddenly during the tour, and in 1799 she married a Frenchman named Felissien, whom, however, she left in 1800. Returning to England she appeared at the New Covent Garden and the Haymarket, and her annual income during 1810 amounted to between £3,000 and £4,000. Henceforward she sang in Italian opera till the end of 1819, when ill-health forced her to abandon her profession. In 1817 she was reconciled to her husband, and went with him to live near Venice, where she died on the 25th of August 1818.

BILLITON (Dutch Biltoeng), an island of the Dutch East Indies, between Banka and Borneo, from which it is separated respectively by Gaspar and Karimata straits. Politically it is under an assistant resident. It is roughly circular in form, its extreme measurements being 58 by 33, and its area 179 sq. m. In physical structure and in products it resembles Banka; its coasts are sandy or marshy; in the interior an extreme elevation of 1670 ft. is found. The geological formation is Devonian and granitic, with laterites. The mean annual rainfall is heavy, 102 to 126 in. The day temperature varies from 86° to 87° Fahr. The nights are very cool. Like Banka, Billiton is chiefly noted for its production of tin, the island forming the southern limit of the occurrence of this metal in this locality. There are upwards of 80 mines, which employ some 7500 workers, and besides these there are over 10 granite beds and quarries of the same. Iron is also worked. On the rocks along the coast are found tortoises, trepang and edible birds’-nests, which are articles of export. The forests supply wood of different kinds for boat-building, in which the inhabitants are expert; and also provide trade in cocoa-nuts, sago, gum, and other produce. The population is about 42,000, of whom some 12,000 are Chinese. The natives belong to two classes, the Orang Darul, the aborigines, thought to be akin to the Battas and other branches of the pre-Malay or Indonesian race; and the Orang Sekoh, people of Malayan stock, who live in boats. The coast is as a rule difficult of access, being beset with rocks and coral banks, and the best bar last that is at the chief town of Tanjong Pandan on the west coast. The island was formerly under the sultan of Palembang, by whom it was ceded to the British in 1812. As no mention was made of it in the treaty between the British and Dutch in 1814, the former at first refused to renounce their possession, and only recognized the Dutch claim in 1824. Till 1852 Billiton was dependent on Banka.

Bill of Exchange, a form of negotiable instrument, defined below, the history of which, though somewhat obscure, was ably summed up by Lord Chief Justice Cockburn in his judgment in Goodwin v. Robarts (1875), L.R. 10 Ex. pp. 346–358. Bills of exchange were probably invented by Florentine Jews. They were well known in England in the middle ages, though there is no reported decision on a bill of exchange before the year 1693. At first their use seems to have been confined to foreign bills between English and foreign merchants. It was afterwards extended to domestic bills between traders, and finally to bills of all persons, whether traders or not. But for some time after they had come into general employment, bills were always allowed to the legal tender of the country in which they were made. The practice known as consuetudinem mercatorum. The foundations of modern English law were laid by Lord Mansfield with the aid of judges of London merchants. No better tribunal of commerce could have been devised. Subsequent judicial decisions have developed and systematized the principles thus laid down. Promissory notes are of more modern origin than bills of exchange, and their validity as negotiable instruments was doubtful until it was confirmed by a statute of Anne (1714). Cheques are the creation of the modern system of banking.

Before 1828 the English law was to be found in 17 statutes dealing with isolated points, and about 1,600 cases scattered over some 300 volumes of reports. The Bills of Exchange Act 1882 codifies for the United Kingdom the law relating to bills of exchange, promissory notes and cheques. One peculiar Scottish rule is preserved, but in other respects uniform rules are laid down for England, Scotland and Ireland. After glancing briefly at the history of these instruments, it will probably be convenient to discuss the subject in the order followed by the act, namely, first, to treat of a bill of exchange, which is the original and typical negotiable instrument, and then to refer to the cheques, provided for in the law merchant, which is part of the common law, and are now confirmed by statute.

Definition.—By § 3 of the act a bill of exchange is defined to be "an unconditional order in writing, addressed by one person to another, signed by the person giving it, requiring the person to whom it is addressed to pay on demand or at a fixed or determinable future time a sum certain in money to or to the order of a specified person, or to bearer." The person who gives the order is called the drawer. The person thereby required to pay is called the drawee. If he assents to the order, he is then called 1

1 This is also the definition given in the United States, by § 126 of the general act relating to negotiable instruments, prepared by the conference of state commissioners on uniform legislation, and it has been adopted in the leading states.

[0x0]
BILL OF EXCHANGE

of it, but he is not the mercantile owner, and he is not technically the holder or bearer. But to get the full advantages of mercantile ownership the holder must be a "holder in due course," —that is to say, he must satisfy three business conditions. First, he must have given value, or claim through some holder who has given value. Secondly, when he takes the bill, it must not be overdue on the face of it. In particular, the bill must not be overdue or known to be dishonoured. An overdue bill, or a bill which has been dishonoured, is still negotiable, but in a restricted sense. The transferee cannot acquire a better title than the party from whom he took it (§ 36). Thirdly, he must take the bill honestly and without notice of any defect in the title of the transferor,—as, for instance, that the bill or acceptance had been obtained by fraud, or threats or for an illegal consideration. If he satisfies these conditions he obtains an indefeasible title, and can enforce bill against all parties thereto. The act substitutes the expression "holder in due course" for the somewhat cumbersome older expression "bona fide holder for value without notice." The statutory term has the advantage of being positive instead of negative. The French equivalent "tiers porteur de bonne foi" is expressive. Forgery, of course, stands on a different footing from a mere defect of title. A forged signature, as a general rule, is a nullity. A person who claims through a forged signature has no title himself, and cannot give a title to any one else (§ 24). Two exceptions to this general rule require to be noted. First, a banker who receives a forged signature to a note or bill of exchange, has no duty to use reasonable diligence. When a bill is payable after sight, presentment for acceptance is necessary in order to fix the maturity of the bill. Accordingly the bill must be presented for acceptance within a reasonable time. When a bill is payable on demand it must be presented for payment within a reasonable time. When it is payable at a future time it must be presented on the day that it is due. If the bill is dishonoured the holder must notify promptly the fact of dishonour to any drawer and indorsers he wishes to charge. If, for example, the holder only gives notice of dishonour to the last indorser, he would not have the drawer unless the last indorser or some other party liable has duly sent notice to the drawer. When a foreign bill is dishonoured the holder must cause it to be protested by a notary public. The bill must be noted for protest on the day of its dishonour. If this be duly done, the protest, i.e., the formal notarial certificate attesting the dishonour, can be drawn up at any time as of the date of the noting. A dishonoured inland bill may be noted, and the holder can recover the expenses of noting, but no legal consequences attach thereto. In practice, however, noting is usually accepted as showing that a bill has been duly presented for payment and dishonoured. When a dishonoured or indorsed bill has been protested, the drawer or indorser has reason to expect that the bill may be dishonoured by the drawee. In that case he may insert the name of a "referee in case of need." But whether he does so or not, when a bill has been duly noted for protest, any person may, with the consent of the holder, intervene for the honour of any party liable on the bill. If the bill has been dishonoured by non-acceptance it may be "accepted for honour supra protest." If it has been dishonoured by non-payment it may be paid supra protest. When a bill is thus paid and the proper formalities are complied with by the person who pays becomes invested with the rights and duties of the holder so far as regards the party for whose honour he has paid the bill, and all parties antecedent to him (§§ 65 to 68).

Discharge,—Normally a bill is discharged by payment in due course, that is to say, by payment by the drawee or acceptor to the holder at or after maturity. But it may also be discharged in other ways, as for example by coincidence of right and liability (§ 61), voluntary renunciation (§ 62), cancellation (§ 63), or material alteration (§ 64).

Conflict of Laws.—A bill of exchange is the most cosmopolitan of all commercial instruments. It may be drawn in one country, payable in another, and indorsed on its journey to its destination in two or three more. The laws of all these countries may differ. Provision for this conflict of laws is made by § 72, which lays down rules for determining by what law the rights and duties of the various parties are to be measured and regulated. Speaking broadly, these rules follow the maxim "Locus regit actum." A man must be expected to know and follow the law of the place where he conducts his business, but no man can be expected to know the laws of every country through which a bill may travel. For safety of transmission from country to country bills are often made out in sets. The set usually consists of three counterpart parts, each part being numbered and containing a reference to the other parts. The whole set then constitutes one bill, and the drawee must be careful only to accept one part, otherwise if different accepted parts get into the hands of different holders, he may be liable to pay the bill twice (§ 71). Foreign bills circulating through different countries have given rise to many intricate questions of law. But the subject is perhaps one of diminishing importance, as in many trades the system of "cable transfer" is now superceding the system of bills.

A cheque is a bill of exchange drawn on a banker payable on demand (§ 73). For the most part the rules of law applicable to bills payable on demand apply in their entirety to cheques. But there are certain peculiar rules relating to the latter which arise from the fact that the relationship of banker and customer subsists between the drawer and drawee of a cheque. For example, when a person has an account at a bank he is, as an inference of law, entitled to draw on it by means of cheques. A right to overdraw, can, of course, only arise from agreement. "The drawer of a cheque is not absolutely discharged by the holder's omission to present it for payment within a reasonable time. He is only discharged to the extent of any actual damage he may have suffered through the delay (§ 74). Apart from any question of delay, a banker's authority to pay his customer's cheques is determined by countermand of payment or by notice of the customer's death (§ 75). Of recent years the use of cheques has enormously increased, and they have now become the normal machinery by which all but the smallest debts are discharged. To guard against fraud, and to facilitate the safe transmission of cheques in foreign countries the Banking Act of 1876 has been devised which makes the use of crossed cheques payable only through certain channels. The first act which gave legislative recognition to the practice of crossing was the 19 and 20 Vict. c. 95. That act was amended in 1858, and a consolidating and amending act was passed in 1876. The act of 1876 is now repealed, and its provisions are re-enacted with slight modifications by §§ 76 to 82 of the Bills of Exchange Act 1883. A cheque may be crossed either "generally" or "specially." A cheque is crossed generally by drawing across it two parallel lines and writing between them the words "crossed" or "not negotiable." A cheque crossed "not negotiable" is still transferable, but its negotiable quality is restricted. It is put on pretty much the same footing as an overdue bill. The person who takes it does not get, and cannot give a better title to it, than that which the person from whom he took it had. These provisions are supplemented by provisions for the protection of paying and collecting bankers who act in good faith and without negligence. Suppose that a cheque payable to bearer, which is crossed generally and with the words "not
negotiable," is stolen. The thief then gets a tradesman to
cash it for him, and the tradesman gets the cheque paid on
presentment through his banker. The banker who pays and
the banker who receives the money for the tradesman are pro-
tected, but the tradesman would be liable to refund the money
to the true owner. Again, assuming payment of the cheque
to have been stopped, the tradesman could not maintain an
action against the drawer.
A promissory note is defined by section 83 of the act to be
an "unconditional promise in writing made by one person to
another, signed by the maker, engaging to pay on
demand, or at a fixed or determinable future time,
a sum certain in money to or to the order of a specified
person or to bearer." A promissory note may be made by two
or more makers, and they may be liable either jointly, or jointly
and severally, according to its tenor (§ 85). For the most part,
rules of law applicable to a bill of exchange apply also to a
promissory note, but they require adaptation. A note differs
from a bill in this: it is a direct promise to pay, and not an
order to pay. When it issues it bears on it the engagement
of the principal debtor who is primarily liable thereon. The
formula for applying to notes the rules as to bills is that "the
maker of a note shall be deemed to correspond with the acceptor
of a bill, and the first indorser of a note shall be deemed to
 correspond with the drawer of a bill payable to drawer's order"
(§ 85). Rules relating to presentment for acceptance, accept-
ance, acceptance supra protest, and bills in a set, have no
application to a note. Moreover, when a foreign note is dis-
honored, it may also be acceptable for English purposes, to protest it.
All promissory notes are, under the Stamp Act 1891, subject to an
ad valorem stamp duty. Inland notes must be on impressed stamp paper. Foreign
notes are stamped with adhesive stamps. For ordinary legal purposes a bank note may be regarded as a
promissory note made by a banker payable to bearer on demand. It
is, however, subject to special stamp regulations. It is not
discharged by payment, but may be re-issued again and again.
In the interests of the currency the issue of bank notes is subject
to various statutory restrictions. A bank, other than the Bank
of England, may not issue notes in England unless it had a
lawful note issue in 1814. On the other hand, Bank of England
notes are legal tender except by the bank itself.

In fundamental principles there is general agreement between
the laws of all commercial nations regarding negotiable in-
struments. As Mr Justice Story, the great American
lawyer, says: "The law respecting negotiable instru-
ments may be truly declared, in the language of
Cicero, to be in a great measure not the law of a single country
only, but of the whole commercial world. Non erit lex alia
Romanes, alia Athenis, alia nunc alia posthoc, sed et apud omnes
gentes et omnes temporum, una cademque lex obiuncta!" (Swift v.
Tyson, 16 Peters I.). But in matters of detail each nation has
impressed its individuality on its own system. The English
code has been summarized above. Perhaps its special char-
acteristics may be best brought out by comparing it with the French
code and noting some salient divergences. English law has
been developed gradually by judicial decision founded on trade
custom. French law was codified in the 17th century by the
"Ordonnance de 1671." The existing "Code de Commerce"
amplifies but substantially adopts the provisions of the "Ordo-
nance." The growth of French law was thus arrested at an
early period of its development. The result is instructive.
A reference to Marius' treatise on bills of exchange, published
about 1670, or Beawes' Lex Mercatoria, published about 1740,
shows that the law, or rather the practice, as to bills of ex-
change was even then fairly well defined. Comparing the
practice of that time with the law as it now stands, it will be
seen that it has been modified in some important respects.
For the most part, where English law differs from French law,
the latter is in strict accordance with the rules laid down by
Beawes. The fact is that, when Beawes wrote, the law or
practice of both nations on this subject was nearly uniform.
But English law has gone on growing while French law has stood
still. A bill of exchange in its origin was an instrument by
which a trade debt due in one place was transferred to another
place. This theory French law rigidly keeps in view. In Eng-
land bills have developed into a paper currency of perfect
flexibility. In France a bill represents a trade transaction;
In England it is merely an instrument of credit. English law
affords full play to the system of accommodation paper; French
law confines itself to stamp it out. A comparison of some of the
main points of difference between English and French will
show how the two theories work. In England it is no longer
necessary to express on a bill that value has been given for it,
for the law raises a presumption to that effect. In France
the nature of the consideration must be stated, and a false
statement of value avoids the bill in the hands of all parties
with notice. In England a bill may be drawn and payable in
the same place. In France the place where a bill is drawn should
be so far distant from the place where it is payable that there
may be a possible rate of exchange between the two. This
so-called "distantia loci" is said to be disregarded in practice
but the code is unalterable. As French lawyers put it, a bill of
exchange necessarily presupposes a contract of exchange. In
England since 1675 a bill may be drawn payable to bearer,
though formerly it was otherwise. In France it must be payable
to order; if it were not so it is clear that the rule requiring the
consideration to be truly stated would be a nullity. In England
a bill originally payable to order becomes payable to bearer
when indorsed in blank. In France an indorsement in blank
merely operates as a procuration. An indorsement, to operate
the law, the indorser must state the considera-
tion; in short, it must conform to the English bill
draft. In England, if a bill is dishonoured by non-acceptance,
a right of action at once accrues to the holder. In France
no cause of action arises unless the bill is again dishonoured at
maturity; the holder in the meantime is only entitled to demand
security from the drawer and indorsers. In England a sharp
distinction is drawn between current and overdue bills.
In France no such distinction is drawn. In England no protest
is required in the case of the dishonour of an inland bill, notice
of dishonour being sufficient. In France every dishonoured
bill must be protested. Opinions may differ whether the English
or the French system is better calculated to serve sound commerce
and promote a healthy commercial morality. But an argument
in favour of the English system may be derived from the fact
that as the various continental codes are from time to
time revised and re-enacted, they tend to depart from the French
model and to approximate to the English rule. The effect
upon English law of its codification has yet to be proved.
A common objection to codification in England is that it
deprives the law of its elastic character. But when principles are once
settled common law has a certain vitality outside. On the other
hand no code is final. Modern parliaments legislate very fre-
quently, and it is a much simpler task to alter statute law than to alter
common law. Moreover, legislation is cheaper than litigation.
One consequence of the codification of the English law relating
to bills is clear gain. Nearly all the British colonies have
adopted the act, and where countries are so closely connected
as England and her colonies, it is an obvious advantage that
their mercantile transactions should be governed by one and the
same law expressed in the same words.

The ordinary text-books on the law of bills of exchange are con-
stantly re-edited and brought up to date. The following among
others may be consulted—Byles, Bills of Exchange; Chalmers,
Bills of Exchange; Daniel, Law of Negotiable Instruments (United
States); Nouguier, Des lettres de change et des effets de commerce
(France); Thoburn, Bills of Exchange Act 1882 (Scotland); Story,
Bills of Exchange (United States); Hodgin, Bills of Exchange Act
1890 (Canada).

(M. D. Ch.)

BILL OF RIGHTS, an important statute in English constitu-
tional history. On the 13th of February 1689 the Declaration
of Right, a document drawn up by a committee of the commons,
and embodying the fundamental principles of the constitution,
was delivered by the lords and commons to the prince and
princess of Orange, afterwards William III. and Mary. In
December 1699 the rights claimed by the declaration were enacted with some alterations by the Bill of Rights, next to Magna Carta the greatest landmark in the constitutional history of England and the nearest approach to the written constitutions of other countries. The act (the full name of which is An Act declaring the Rights and Liberties of the Subject, and setting the Succession of the Crown), after reciting the unconstitutional proceedings of James II., the abdication of that king, the consequent vacation of the crown, and the summons of the convention parliament, declared, on the part of the lords and commons, "for the vindicating and asserting their ancient rights and liberties"

1. That the pretended power of suspending laws or the execution of laws by regal authority without consent of parliament is illegal.
2. That the pretended power of dispensing with laws or the execution of laws by regal authority, which hath been assumed and exercised of late, is illegal.
3. That the commission for erecting the late court of commissioners for ecclesiastical causes, and all other commissions and courts of like nature, are illegal and pernicious.
4. That levying money for or to the use of the crown, by pretence of prerogative, without grant of parliament, for longer time or in other manner than the same is or shall be granted, is illegal.
5. That it is the right of the subjects to petition the king, and all com- mittances and prosecutions for such petitioning are illegal.
6. That the raising or keeping a standing army within the kingdom in time of peace, unless it be with consent of parliament, is against law.
7. That bills of attainder, bills of pardo, and bills of morter, have no validity without the assent of parliament.
8. That elections of members of parliament ought to be free.
9. That the freedom of speech, and debates or proceedings in parliament, ought not to be impeach'd or question'd in any other court or place out of parliament.
10. That excessive bail ought not to be required, nor excessive fines imposed, nor cruel and unusual punishments inflicted.
11. That the raising or quartering of soldiers within the kingdom of Great Britain, without the consent of parliament, is illegal.
12. That the fines, feoffments, morter, and other sales, of any person for his life, or during his natural term, are illegal.
13. That for redress of all grievances, and for the amending, strengthening and preserving of the laws, parliament ought to be held frequently. And they do claim, demand and insist upon all and singular the premises, as their undoubted rights and liberties.

The further provisions of the act were concerned with the settlement of the crown upon the prince of Orange, and with the execution of § 12, which negatived the right of dispensation by non obstante 1 to or of any statute or any part thereof, unless a dispensation be allowed in the statute itself or by bill or bills to be passed during the then session of parliament.

It is to be noticed that the Declaration of Right and the Bill of Rights introduced no new principle into the English constitution; it was merely a declaration of the law as it stood. In the United States, the main provisions of the Bill of Rights, so far as they are applicable, have been adopted both in the constitution of the United States and in the state constitutions.

The English legislation on the subject was the Bills of Sale Act 1854, which, after reciting that "frauds were frequently committed upon creditors by secret bills of sale of personal chattels, whereby persons are enabled to keep up the appearance of ownership of property, and to dispose of it to the detriment of creditors," the act declared that all grants of property, the grantees or holders of such bills of sale have the power of taking possession of the property of such person to the exclusion of the rest of their creditors," provided that all bills of sale, as defined in the act, should be void against execution creditors unless registered. This act was amended by the Bills of Sale Act 1866. These acts were repealed and a new act passed, the Bills of Sale Act 1878, which, in the main, followed the lines of the act of 1854. The scope of this legislation was very much widened by the Bills of Sale Act 1878 Amendment Act 1882, which amended (1) by declaring "that a person newly appearing to have been entrapped into signing complicated documents which he might often be unable to comprehend, and so being subjected by their creditors to the enforcement of harsh and unreasonable provisions" (Manchester &c. Ry. Co. v. N.C. Wagon Co., 1888, 13 App. Ca. 554). The law is now regulated by these two acts, together with the Bills of Sale Acts of 1890 and 1891, which effected further small amendments by excluding from the operation of the principal acts instruments hypothecating, charging or declaring trusts on imported goods, during the time of the purchase agreements, and during the time of the ship and deposit in a warehouse, or re-shiping.

Under the acts of 1878 and 1882 bills of sale are of two kinds, i.e. absolute bills of sale (where chattels are sold absolutely to a purchaser), and bills of sale by way of security for the payment of money. The Bills of Sale Act 1878 governs both kinds and is the only act which applies to absolute bills. Bills of sale given by way of security for the payment of money on or after the 1st of November 1882 are governed by the act of 1882, which, however, does not apply to absolute bills. Section 4 of the act of 1878 defines a bill of sale as (1) including bills of sale, assignments, transfers, declarations, and trust securities of goods with receipt thereto attached, or receipts for purchase monies of goods and other assurances of personal chattels; the term assurance has been best explained as a document "on which the title of the transferee of the goods depends, either as the actual transfer of the property, or an agreement to transfer," Marsten v. Meadows, 1881, 7 Q.B.D. 80; (2) powers of attorney, authorities or licences to take possession of personal chattels as security for any debt; these words would not include a power of distress for rent in an ordinary lease or for fine or for the like.; (3) any agreement, whether intended or not to be followed by the execution of any other instrument, by which a right in equity to any personal chattels, or to any charge or mortgage thereon, shall be conferred; (4) any mode of disposition of trade machinery and attornements and other instruments giving powers of distress to secure a debt or advance. On the other hand, certain assurances and instruments are expressly exempt by statute from the definition: marriage settlements, assignments of ships, assignments for the benefit of creditors, bills of lading and dock warrants, and by the act of 1882, debentures and debenture shares of companies. The expression "personal chattels" is defined as goods, furniture and other articles capable of complete transfer by delivery, and (when separately assigned or charged) fixtures and growing crops.

Absolute Bills.—Absolute bills of sale must be duly attested by a solicitor, and the attestation must state that before execution the effect of it was explained to the grantor by the attesting solicitor.

Schedules of Sale.—Schedules of sale document assigning personal property, and still used in connexion with the transfer of property in ships. The term has come to be applied to mortgages as well as to sales, and the expression "bill of sale" may now be understood to signify generally a document evidencing a sale or mortgage of personal chattels, unaccompanied by an actual transfer of possession to the purchaser or mortgagor.

The first English legislation on the subject was the Bills of Sale Act 1854, which, after reciting that "frauds were frequently committed upon creditors by secret bills of sale of personal chattels, whereby persons are enabled to keep up the appearance of ownership of property, and to dispose of it to the detriment of creditors," the act declared that all grants of property, the grantees or holders of such bills of sale have the power of taking possession of the property of such person to the exclusion of the rest of their creditors," provided that all bills of sale, as defined in the act, should be void against execution creditors unless registered. This act was amended by the Bills of Sale Act 1866. These acts were repealed and a new act passed, the Bills of Sale Act 1878, which, in the main, followed the lines of the act of 1854. The scope of this legislation was very much widened by the Bills of Sale Act 1878 Amendment Act 1882, which amended (1) by declaring "that a person newly appearing to have been entrapped into signing complicated documents which he might

1. Non obstante (notwithstanding) means a licence from the crown to do that which could not be lawfully done without it.
which the parties may agree to for the maintenance or defrausance of the security). Provided always that the chattels hereby assigned shall not be liable to seizure or to be taken possession of by the said C. D., for any cause other than those specified in § 7 of the Bills of Sale Act 1888 Amendment Act 1882.

In witness, &c.

Signed and sealed by the said A. B. in the presence of me E. F. (add witness’s name, address and description).

Non-compliance with the requirements of the statute as to from recording the bill of sale void even as between the parties. The bill of sale must have annexed to it an inventory of the chattels comprised in it, and is void, except as against the grantor, in respect of any person or persons not personally described. It must be accompanied by one or more credible witnesses (not necessarily by a solicitor, as in the case of absolute bills). Every witness must sign his name and add his address and description. It must be delivered within the space of seven days from the date thereof, or if it is executed in any place out of England then within seven clear days after the time at which it would in the ordinary course of post arrive in England if posted immediately after the execution. It must truly set forth the consideration.

The grantor must be the true owner of the goods described in the schedule; as to any personal chattels of which he is not the true owner, the bill is void, except as against the grantor. Every absolute bill of sale void under §50 is void. By §7 of the act personal chattels shall only be liable to be seized or taken possession of in the following cases—

(1) If the grantor make default in payment of the debt or in performance of the undertaking contained in the bill, necessary for maintaining the security; (2) if the grantor becomes a bankrupt or sunder the goods to be distrained for rents, rates or taxes; (3) if the grantor oricultural removes the goods from the premises; (4) if the grantor does not, without reasonable excuse, upon demand in writing by the grantee, produce to him his last receipts for rent, rates or taxes; (5) if execution is levied against the goods under the act of settlement 1867, &c., and the chattels seized or taken possession of under a bill must not be removed or sold until after the expiration of five clear days from the date of seizure, and, if the goods have been wrongfully seized, the grantor may within the five days apply to the High Court or a judge in chambers for an order to restrain the grantee from removing or selling the goods. The Bills of Sale Acts 1878 and 1882 do not apply to Scotland.

The Irish statutes corresponding to the English acts are the Bills of Sale (Ireland) Act 1879 and the Amendment Act 1883.

The stamp duties payable on an absolute bill of sale are 2s. 6d. on every £525 secured up to £500; over £500, 5s. on every £50. On bills of sale by way of security, 1s. 3d. for every £50 up to £300 secured; over £300, 2s. 6d. for every £100. The fees payable on filing a bill, where the con- vention includes any further advances) does not exceed £100; above £100 and not exceeding £200, 10s.; above £200, £1.

The stamps are to be affixed in the preservation papers always publish the registration of a bill of sale, and the usual effect is, therefore, to destroy the credit of any person giving any. (T. A. I.)

BILLROTH, ALBERT CHRISTIAN THEODOR (1825-1894), Viennese surgeon, was born on the 26th of April 1825 at Bergen, on the island of Rügen, his family being of Swedish origin. He studied at the universities of Greifswald, Göttingen and Berlin, and after taking his doctor’s degree at the last in 1852, started on an educational tour, in the course of which he visited the medical schools of Vienna, Prague, Paris, Edinburgh and London. On his return to Berlin he acted as assistant to B. K. R. Langenbeck. From 1853 to 1860, and then succeeded Langenbeck as professor of surgery at Zürich. In 1867 he was invited to fill the same position at Vienna, and in that city the remainder of his professional life was spent. In 1885 he received the distinction, rarely bestowed on members of his profession, of a seat in the Austrian Herrnhau. He died at Abbadia, on the Adriatic, where he had a beautiful villa, on the 6th of February 1894. Billroth was one of the most distinguished surgeons of his day. His boldness as an operator was only equalled by his skill and resourcefulness; no accident or emergency could disturb his coolness and presence of mind, and his ability to invent or carry out drastic measures that might be demanded in the particular case with which he was dealing, gained for him the appellation of "surgeon of great initiatives." At the same time he was full of consideration for the comfort and well-being of his patient, and never forgot that he had before him a human being to be relieved, not a mere "case" for the display of technical dexterity. He was especially interested in military surgery, and during the Franco-German War volunteered to serve in the hospitals of Mannheim and Weissenburg. His efforts did much to improve the arrangements for the transport and treatment of the wounded in war, and in a famous speech on the War Budget in 1891, he eloquently urged the necessity for an improved ambulance system, pointing out that the use of smokeless powder and the greater precision of the arms of modern warfare must tend to increase the number of men wounded, and that therefore more efficient means must be provided for removing them from the battlefield. Possessing a clear and graceful style, he was the author of numerous papers and books on medical subjects; his _Allgemeine chirurgische Pathologie und Therapie_ (1863) ran into many languages. He was of an exceedingly artistic disposition, and in particular was devoted to music. A good performer on the pianoforte and violin, he was an intimate friend and admirer of Brahms, many of whose compositions were privately performed at his house before they were published. His work on the physiology of music (Wer ist musikalisch?) was published after his death.

BILMA, or KAWAR, an oasis in the heart of the Sahara desert, some 60 m. long by 10 m. The inhabitants are Tibbu and Kanuri. The name Bilma is properly confined to the southern part of the region, where is the chief settlement, called Bilma or Gar. This place is 800 m. due S. of the town of Tripoli and about 350 m. N. of the N.W. corner of Lake Chad. In the vicinity are a number of lakes, the waters of which on evaporation yield large quantities of very pure and fine salt, which is the object of an extensive trade with the countries of Central Africa. North of Bilma is the town of Dirka, said to date from the 11th century. Near Bilma is a small circular oasis, kept green by a fine spring, but immediately to the south begins the most dreary part of the Saharan desert, over which the caravans travel for fifteen days without discovering the slightest trace of habitation. The Arabic word Bilma in 1875, records that the temperature during the day rarely sank below 113° Fahr. By the Anglo-French Declaration of the 21st of March 1899 Bilma was included in the French sphere of influence in West Africa. Turkey claimed the oasis as part of the hinterland of Tripoli and garrisoned Bilma in 1902. In 1906, however, a French force from Zinder occupied the town, no opposition being offered by the Ottoman authorities. In 1907 the oasis and surrounding district was created a circle of the Military Territory of the Niger (see SAHARA).
and several bishops in the chapter-house at Westminster, he was convicted of having, sentence being deferred while efforts were made to induce him to recant, which eventually he did. After being kept for more than a year in the Tower, he was released in 1529, and went back to Cambridge. Here he was overcome with remorse for his apostasy, and after two years determined to preach again what he had held to be the truth. The churches being no longer open to him, he preached openly in the fields, finally arriving in Norwich, where the bishop, Richard Nix, caused him to be arrested. Articles were drawn up against him by Convocation, he was tried, degraded from his orders and handed over to the authorities to be burned. The sentence was carried out in London on the 10th of August 1531. A parliamentary inquiry was threatened into this case, not because parliament approved of Bilney’s doctrine but because it was alleged that Bilney’s execution had been obtained by the ecclesiastics without the proper authorization by the state. In 1534 Bishop Nix was condemned on this charge on the confiscation of his property. The significance of Bilney’s execution lies in the fact that on essential points he was an orthodox Roman Catholic.

BILBOY, a city of Harrison county, Mississippi, U.S.A., in the south part of the state, on Biloxi Bay, a branch of the Mississippi Sound, which is a part of the Gulf of Mexico. By rail it is 80 m. N.E. of New Orleans and 61 m. S.E. of Mobile, Alabama. Pop. (1880) 1540; (1890) 3234; (1900) 640 negroes and 445 foreign-born; (1910) 7088. The city is served by a branch of the Louisville & Nashville railway, and by an electric railway extending to Bay St Louis, through Gulfport (pop., 1900, 1906; 1910, 6386), 13 m. S.W., the port of entry of the Pearl River customs district, whose exports chiefly timber, lumber, naval stores and charcoal, were valued at $8,392,771 in 1907. Biloxi is both a summer and a winter resort, particularly for the people of New Orleans and Mobile, and has a fine beach, extending for about 12 m. around its peninsula, and bordered by an automobile drive; along the beach are some attractive residences, hotels and boarding houses, and several sanatoriums. The city’s principal industries are the canning of oysters, shrimp, fish, figs and vegetables, and the manufacture of fertilizers and flour. A beautiful thin facine with remarkable metallic glasses is made here. The manufacture of the glass is obtained from artesian wells. Pierre le Moyne d’Iberville (1661-1706) in 1699 built Fort Maurepas across the bay from the present city; and the settlement there, called Biloxi after the Biloxi Indians, was the first to be established by the French in this region. In 1702 this post, known as Old Biloxi, was abandoned, and the seat of government was removed to the Mobile river. In 1712 a settlement was made on the present site, being the first permanent settlement within what is now the state of Mississippi. Many of the early settlers were French Canadians, who came down the Mississippi to join the new colony. Biloxi was again the capital from 1710 until 1722. It was incorporated as a village in 1872, and was chartered as a city in 1896.

BILSTON, a market town of Staffordshire, England, 21 m. S.E. of Wolverhampton and 142 N.W. of London, in the Black Country. Pop. of urban district (1901) 24,034. It is served by the Great Western railway, and by the London & North-Western at Ettingshall Road station. In the vicinity are very productive mines of coal and ironstone, as well as sand of fine quality for casting, and grinding-stones for cutters. Bilston coal is used for making large quantities of vitrified ware, for the preparation of iron, and a great variety of factories for japanned and painted goods, brass-work and heavy iron goods. Though retaining no relics of antiquity, the town is very ancient, appearing in Domesday. The parish church of St Leonard, dating as it stands mainly from 1827, is on the site of a building of the 13th century. Bilston suffered severely from an outbreak of cholera in 1832. The town is within the parliamentary borough of Wolverhampton.

BILTONG, a South African Dutch word (from bil, buttock, and tong, tongue), for sun-dried strips of antelope or buffalo meat.

BIMANA (Lat. "two-handed"), a word first used by the naturalist Johann Friedrich Blumenbach to distinguish the order of man from Quadrumana or other mammals. The term was popularized by Cuvier, and the majority of writers followed him in its adoption. In 1803, however, Huxley in his Man’s Place in Nature demonstrated that the higher apes might fairly be included in Bimana. Again and again it has been proved that the human great toe can be by constant practice used as a thumb; and canes which have enabled the apes to support themselves on their toes, and violins have been known to play their instruments in the same manner. Among many savage races there is developed a remarkable power of foot-grasp, which in a lesser degree is often so noticeable among sailors. Haeckel calls attention to the fact that a baby can hold a spoon with the big-toe as with a thumb. Man, in a word, is potentially quadrumanous.

BIMETALLISM. The very general employment of both gold and silver for currency purposes (see Money) has given rise to serious practical difficulties which have in turn led to keen theoretical discussion as to the relative advantage of one system or the other. The best known system of currency arrangement under which two metals form the money of a region may be described as “bimetallism,” the term—as often happens in economics—has received a specialized meaning. It denotes a system under which the two metals are freely received by the mint and are equally available as legal tender. The last clause implies the establishment of a definite ratio in value between the two metals (e.g. 1 oz of gold =$125 oz of silver) so that the title “rated bimetallism” may be given to it, in contradistinction to the “unrated bimetallism” which exists wherever two metals circulate together, but have their relative values determined, not by law, but by “the higgling of the market.” Further, the inventor of the term—H. Cernuschi in 1866—regarded it as properly applicable to an international arrangement by which a number of states agree to adopt the same ratio, rather than to the use of the two metals by a single country, which may be described as national bimetallism. International bimetallism is at all events the form which has attracted attention in recent times, and it is certainly the most important.

Regarded from the historical point of view it appears that the failure of separate countries to maintain the two metals in circulation was the cause which produced the idea of bimetallism. In the earlier years of the 19th century, when the monetary disturbances that resulted from the Revolutionary wars had ceased, we find France (1803) and the United States (1792) with the double standard legally established. England, on the other hand, had in 1816 accepted by law the gold standard, which had come into use in the 18th century. Silver formed the currency of the other European countries. The great discoveries of gold in California (1848) and Australia (1851) brought about the displacement of silver by gold in France, and the continuance of gold as the principal currency metal in the United States, where by the law of 1854 it had been somewhat hedged. In 1861, as compared with the ratio adopted in France (1:15), and had therefore expelled most of the silver previously in circulation. Between 1848 and 1860 over $100,000,000 of gold was coined in France, while an equivalent amount of silver was exported, principally to the East.

At this time the weight of economic and official opinion was very decidedly in favour of the single gold standard as the best system. In 1865 the Latin Union was established, in which the French currency system was adopted and was followed by the
international conference of 1867 in Paris (see Monetary Conferences), when gold was unanimously accepted as the standard for the proposed international system to be produced by coordinating the various currencies with that of the Latin Union.

A series of political and economic events speedily changed this situation. The Franco-German War (1870-71) deposed France from her leading position, and led to the establishment of a German gold currency with a different unit from the franc, accompanied by the demonetization of the silver currencies previously in use in the German states. The United States, where an inconvertible paper currency had been introduced during the Civil War, formally established the gold dollar as the standard coin (1873) and arranged for a return to specie payments (1878). At this time, too, the great production of gold which had marked the period 1850-1870 diminished, while very productive silver mines were discovered in the Pacific states of America. As a result of these combined influences the gold price of silver, which had risen a little during the height of the gold discoveries, began to fall rapidly, and the reverse process to that by which France had in the fifties acquired a gold currency came into operation. Silver, in accordance with Gresham's Law, was imported and offered for coinage. To obviate this the policy of limiting the coinage of silver (the Limping Standard) was adopted by the Latin Union. A further fall in the gold price of silver naturally resulted, and this made the position of Eastern trade and the finances of the Indian government insecure. American silver producers, and the German government, as holders of a large mass of demonetized silver, were also sufferers by the depreciation. The effect on public and official opinion was shown by the English parliamentary committees on the depreciation of silver (1876), the American silver commission of the same year, and the appearance of many works on the subject, most of them advocating the double standard. On the initiative of the United States an international monetary conference met in Paris in 1878, but though the necessity of keeping a place for silver in the money of the world was recognized, the proposal to adopt the double standard for general use was rejected by the European states. By the Bland-Allison Act (Feb. 1878) the United States had provided for the coinage of a certain amount of silver per month as a mode of keeping up the price of the metal, which notwithstanding fell to a gold par in 1879. The prolonged depression of trade in America and Germany was attributed to the scarcity of money, due to what was described as "the outlay of silver." By the joint action of France and the United States a fresh monetary conference was held in Paris in 1881, where the advocates of bimetallism were very strongly represented. After prolonged discussion no conclusion was reached, in consequence of the refusal of England and Germany to abandon the gold standard. Though an adjournment to the following year was resolved on, the conference did not reassemble, and the bimetallistic movement took the form of agitation, carried on in each country. The English inquiry into the depression of trade (1885-1886) drew from the commission a recommendation for a fresh commission to investigate the relation of gold and silver. This latter body, appointed in 1886, obtained a great body of important evidence, and in 1888 closed its work by a report in which the views of the two sections of the commission were separately presented. Six members supported the existing gold standard and six were in favour of the bimetallistic system. This inconclusive result was soon followed in the United States by the Sherman Act (1890), providing for a larger monetary coinage of silver. A temporary rise in the price of the metal followed, and in 1891 a further fall, making the situation still more critical. A new movement in favour of bimetallism was summoned by the United States and met in Brussels in November 1892. To modify opposition the "desirability of increasing the use of silver" was the resolution proposed; the actual method being left open. This conference also proved abortive and adjourned to 1893, but like that of 1881 did not meet again.

International action having failed to secure any system of bimetallism, the United States and India sought to relieve their position by local legislation. The former repealed the Sherman Act, and the latter closed its mints to the free coinage of silver (1893). As these measures were opposed to bimetallism in that they restricted the use of silver, and were followed by a lower price for that metal than had ever been known, the agitation in the United States and Europe continued. In America it took the form of advocating the free coinage of silver by the United States without waiting for other countries; and in this shape made the principal issue at the presidential elections of 1896 and 1898, in each of which it was emphatically rejected.

A further attempt at securing international bimetallism was made by Senator Wilcott's commission in 1897. The American envoy, in concert with the French government, proposed to England (1) the reopening of the Indian mints, and (2) the annual purchase by England of £10,000,000 of silver. The French minister claimed further concessions which were regarded as inadmissible by the English government; but the fate of the mission was settled by the refusal of the Indian government to reopen its mints.

After the American election of 1900, bimetallism as a popular cry died out from view. The silver issue was withdrawn from the democratic platform in 1904, and the bimetallistic movement died out in England.

Amongst the causes of this collapse the most important are: (1) the adoption of the gold standard by so many countries—Austria-Hungary (1892), Russia and Japan (1897), India (1899), Mexico (1904)—a movement which pointed to the complete triumph of gold in the future; (2) the great increase in the output of gold. Australia and South Africa so developed their gold mines as to bring the yield for 1896 to £81,000,000 as contrasted with the less than £50,000,000 of 1885. This growing supply removed all that dream of a "gold famine" which served as a popular argument with bimetallists. To these may be added (3) the knowledge that experience had brought of the difficulties surrounding any attempt to establish a common ratio where the interests of different countries are so opposed; and (4) the great expansion of trade and industry, concomitantly with the wider adoption of the gold standard. Therefore, to quote the words of perhaps the ablest advocate of bimetallism, "The outcome of the prolonged controversy ... appears to be that the commercial world will carry on its business principally and more and more on a gold basis, and that particular countries will endeavour in different ways to adjust their actual medium to the gold standard" (Nicholson, Money and Monetary Problems, 6th ed.).

Perhaps the principal service rendered by the many able minds engaged in the movement will prove to be the fuller development of the more difficult parts of monetary theory and the additional light thrown on the course of monetary history.

A proposal, sometimes confounded with bimetallism, is that for a standard composed of both gold and silver, which is better described as the Joint-standard or as Symmetallism.

BILIMIPATAM—BIN

BILIMIPATAM, a town of British India, in the Vizagapatam district of Madras, on the coast 19 m. N.E. of Vizagapatam. It is a port, and was formerly a Dutch factory, and is now the principal port of the district. The anchorage is an open roadstead protected to some extent by headlands with a light-house at Santapalli. Nearly half the sea-borne trade is conducted with foreign countries. The principal exports are oil-seeds, hides and jute.

BIN, a receptacle of various kinds, originally of wicker or basket work. The word appears in most European languages, e.g. M.L. and Ital. benna, Ger. Binde; and etymologists trace the word to a root meaning "to plait." It survives in various
BINAN, a town of the province of La Laguna, Luzon, Philippine Islands, on the W. shore of Laguna de Bay, about 20 m. S.S.E. of Manila. Pop. (1903) 9,563. The town is surrounded by an extensive and extremely fertile plain which produces very large quantities of rice as well as a great variety of tropical fruits, and the busy market for the products of this region is found in Manila whither they are shipped by boat. The language is Tagalog.

BINARY SYSTEM, in astronomy, a system composed of two stars revolving around each other under the influence of their mutual attraction. A distinction was formerly made between double stars of which the components were in revolution around each other, and those in which no relative motion was observed; but it is now considered that all double stars must really be binary systems.

BINCHOS, EGI DlUS (d. 1460), an early 15th-century musical composer evidently named after his birthplace, Binche, near Mons. He was esteemed by contemporary and later theorists as second only to Dunstable and Dufay.

BINGEN (anc. Vincum or Bingium), a town of Germany, in the grand-duchy of Hesse-Darmstadt, 15 m. N.W. from Mainz, on the main line to Cologne. Pop. (1905) 9,590. It is situated on the left bank of the Rhine opposite Küdésheim, at the confluence of the Nahe (or Nava), which is crossed near its mouth by a stone bridge, attributed to Drusus, and certainly of Roman origin, and an iron railway bridge. On a height immediately to the southeast is the ruined castle of Kloppen, on the site of a fortress founded by the Drusii, and higher still the celebrated chapel of St Roch (rebuilt in 1895 after a fire), where thousands of pilgrims gather on the first Sunday after the 16th of August. Apart from its situation, which renders it a convenient place of tourist resort, the town itself presents but few attractions. There are a Protestant and three Roman Catholic churches, among the latter the parish church with a crypt dating from the 11th century, and a medieval town hall. It has a considerable commerce in wine, grain and cattle, and, new quays and a harbour having been recently constructed, does an extensive transit trade in coal and iron. A short way down the Rhine is the Bingerloch, a famous whirlpool, while about halfway between it and the town rises on a rock in the middle of the stream the Mäuseurm (derived from Muserie, cannon), in which, according to legend, Archbishop Hatto II. of Mainz was in 690 eaten by mice (the legend being doubtless due to the erroneous derivation from Mäuse, mice). Another legend states that the Nibelung treasure is hidden hereabouts in the Rhine.

BINGERBRÜCK, a town of Germany, in the Prussian Rhine province, at the confluence of the Nahe and the Rhine, lying just beyond the right bank of the Nahe. It is the junction of the main lines of railways—Mainz-Coblentz and Bingerbrück-Metz. It has an extensive trade in the wines of the district. Pop. 2,500.

BINGHAM, JOSEPH (1668–1723), English scholar and divine, was born at Wakefield in Yorkshire in September 1668. He was educated at University College, Oxford, of which he was made fellow in 1689 and tutor in 1691. A sermon preached by him from the university pulpit, St Mary's, on the meaning of the terms "Person" and "Substance," in the Fathers, brought upon him a most unjust accusation of heresy. He was compelled to give up his fellowship and leave the university; but he was immediately presented by Dr John Radcliffe to the rectory of Headbourneworthy, near Winchester (1695). In this country retirement he began his laborious and valuable work entitled Origines Ecclesiasticae, or Antiquities of the Christian Church, the first volume of which appeared in 1708 and the tenth and last in 1722. His design, learnedly, exhaustively and impartially executed, was "to give such a methodical account of the antiques of the Christian Church as others have done of the Greek and Roman and Jewish antiquities, by reducing the ancient customs, usages and practices of the church under certain proper heads, whereby the reader may take a view at one sight of all the particular usage or custom of Christians for four or five centuries."

Notwithstanding his learning and merit, Bingham received no higher preference than that of Headbourneworthy till 1712, when he was collated to the rectory of Havant, near Portsmouth, by Sir Jonathan Trelawney, bishop of Winchester. Nearly all his little property was lost in the great South Sea Bubble of 1720. He died on the 17th of August 1723.

BINGHAMTON, a city and the county-seat of Broome county, New York, U.S.A., in the south part of the state, on both banks of the north branch of the Susquehanna river, at the mouth of the Chenango river. Pop. (1880) 17,337; (1890) 35,005; (1900) 39,647, of whom 4,727 were foreign-born; (1910), 48,443. It is an important railway centre, being served by the Delaware & Hudson, the Erie, and the Delaware, Lackawanna & Western railways; and an extensive system of electric railways connects it with the suburbs and neighbouring towns. Binghamton is picturesquely situated and has a number of parks, the most attractive of which are Ross Park of 100 acres and Elly Park of 134 acres. Among the principal buildings are the city hall, the court-house, the post-office, the Binghamton city hospital, Stone opera-house, the Carnegie library (1904), the central high school, and a state armoury. Binghamton has also some fine office buildings. Among the city's educational and charitable institutions are the Lady Jane Grey school (for girls), St Joseph's academy, St Mary's home for orphans, the Susquehanna Valley orphan asylum, and a state hospital for the insane.

Binghamton is a manufacturing centre of considerable importance, ranking twelfth in the state in 1905 in the value of factory products, $1,007,425, which was an increase of 32-6% over the value of the factory products in 1900; among its manufactures are fabrics, tobacco products, shoes, furniture, leather goods, tools, machinery, and a variety of other products. The city's principal products are the manufacture of foodstuffs (value in 1905, $8,700,217), patent medicines (value in 1905, $2,133,168), flour and grit mill products ($1,080,910), men's clothing ($833,835), and, of less importance, commercial and computing scales and time recorders, chemicals, distillated liquor, beer, fire-alarm apparatus, overalls, agricultural implements, wagons, electrical apparatus, refined oil, sheet metal, paper bags and envelopes, tacks and nails, window glass, glass-ware, clocks, whips and furniture (especially Morris chairs). In the village of Lestershire (pop. in 1910, 3775; incorporated in 1897), about 2 m. west, and in Endicott, a short distance south, are large boat and shoe factories. The municipality owns and operates the water-works. When Binghamton was first settled, about 1787, it was known as Chenango Point. Its site was originally included in the so-called "Bingham Patent," a tract on both sides of the Susquehanna river owned by William Bingham (1751–1804), a Philadelphia merchant, who was a member of the Continental Congress in 1787–1788 and of the United States Senate in 1795–1801, being president pro tempore of the Senate from the 16th of February to the 3rd of March 1797. In 1800 a village was laid out by an agent of Mr Bingham, and was named Binghamton. In 1818 it was incorporated as a village, and in 1867 was chartered as a city.

BINGLEY, a market town in the Otley parliamentary division of the West Riding of Yorkshire, England, on the Aire, 3½ m. N.W. of Bradford, on the Midland railway. Pop. of urban district (1901) 18,449. The church of All Saints is good Perpendicular, though considerably restored. The large industrial population is engaged principally in the worsted and cotton manufacture. The neighbourhood is populous, but the natural beauty of the Aire valley is not greatly impaired.

BINIOU, or Bivou, a species of cornemuse or bagpipe, still in use at the present day in Brittany. The binioù is a primitive kind of bagpipe consisting of a leather bag inflated by means of a short valved insufflation tube or blow-pipe, a chanter with conical bore furnished with a double reed concealed within the stock or socket (see BAGPIPE), and seven holes, the first being duplicated to accommodate left- and right-handed players.

The scale of the binioù is usually
and the single drone is tuned to the lower octave of the first hole.

The more primitive binioù, still occasionally found in the remote districts of Cornouailles and Morbihan, has a chanter with but five holes,\(^1\) giving part of the scale of D, the drone being also tuned to D. The drone of the binioù is of boxwood, but its sounding tube is of horn, and is usually inserted up to a point, and has a single or beating reed hidden within the stock.

The word binioù is besti (a Gallicized form), which erroneously derived from *binjo (*se renfer plus beau); —*an etymology not supported by Breton dictionaries—*is the Breton plural form of *benwek, instrument, tool, i.e. *bienwe, *bienve.\(^2\) The word is also found in the phrase, “*Sach ar binioù” (a binioù bag), a bag used by weavers to hold their tools, spinndles, &c. The binioù is still the traditional and popular instrument of the Breton peasants of Cornouailles and Morbihan, and is almost inseparable from the bard (q.v.), which is no other than a survival of the medieval musette, hautbois or chalume, formerly associated with the bag-pipe in western Europe (see *Oboe). At all festivals, at the *pardons, wedding feasts and threshing dances, the two traditional musicians or *zourneres give out in shill penetrating tones the ancient Breton *rondes\(^3\) and melodies.

**BINALEY—BINOCULAR INSTRUMENT**

most famous case, in which he was unsuccessfully opposed by Daniel Webster, was the case of *Bidal v. Girard’s Executors*, which involved the disposition of the fortune of Stephen Girard (q.v.). Binney’s argument in this case greatly influenced the interpretation of the law of charities. Binney made many public addresses, the most noteworthy of which, entitled *Life and Character of Chief Justice Marshall*, was published in 1835. He also prepared *Binney’s Life of the Old Bishop of Philadelphia* and *An Inquiry into the Formation of Washington’s Farewell Address* (1839); and during the Civil War he issued three pamphlets (1861, 1862 and 1865), discussing the right of habeas corpus under the American Constitution, and justifying President Lincoln in his suspension of the writ.

- See the *Life of Horace Binney* (Philadelphia, 1904), by his grandson, C. C. Binney.

**BINNEY, THOMAS** (1798-1874), English Congregationalist divine, was born of Presbyterian parents at Newcastle-on-Tyne in 1798, and educated at an ordinary day school. After spending seven years in the *Drift* he entered the theological school at Wymondley, Herts, now incorporated in New College, Hampstead. In 1829, after short pastorates at Bedford (New Meeting) and Newport, Isle of Wight, he accepted a call to the historic Weigh House chapel, London. Here he became very popular, and it was found necessary to build a much larger chapel on Fish Street Hill, to which the congregation removed in 1834. An address delivered on the occasion of the laying of the foundation stone was published, with an appendix containing a strong attack on the influence of the Church of England, which gave rise to a long *Bunyan* controversy. Throughout his whole career Binney was a vigorous opponent of the state church principle, but those who simply classified him as a narrow-minded political dissenter did him injustice. His liberality of view and breadth of ecclesiastical sympathy entitle him to rank on questions of Nonconformity among the most distinguished of the school of Richard Baxter; and he maintained friendly relations with many of the dignitaries of the Established Church. He continued to discharge the duties of the ministry until 1869, when he resigned. In 1845 he paid a visit to Canada and the United States, and in 1857-1859 to the Australian colonies. The university of Aberdeen entered him the L.L.D. degree on him in 1857, and he was twice chairman of the Congregational Union of England and Wales.

- Binney was the pioneer in a much-needed improvement of the forms of service in Nonconformist churches, and gave a special impulse to congregational psalmody by the publication of a book entitled *The Service of Song in the House of the Lord*. Of numerous other works the best-known is his *Is It Possible to Make the Best of Both Worlds?* an expansion of a lecture delivered to young men in Exeter Hall, which attained a circulation of 30,000 copies within a year of its publication. He wrote much devotional verse, including the well-known hymn “*Eternal Light! Eternal Light!*” His last sermon was preached in November 1873, and after some months of suffering he died on the 24th of February 1874. Dean Stanley assisted at his funeral service in Abney Park cemetery.

**BINOCULAR INSTRUMENT**, or briefly *Binocular*, an apparatus through which objects are viewed with both eyes. In this article only those instruments will be considered in which solid objects or objects in space are viewed; reference should be made to the article *Stereoscope* for the instruments in which plane representations are offered to both eyes. The natural vision is such that different central projections of the objects are communicated to both eyes; the difference of the two perspective representations arises from the fact that the projection centres are laterally separated by an interval about equal to the distance between the eyes (the inter-papillary distance). Binocular instruments should aid the natural spatial or stereoscopic vision, or make it possible if the eyes fail. If the objects be so far

\(^{1}\) The term binocular (from the Lat. *bini*, two at a time, and *oculi*, eyes) was originally an adjective used to describe things adapted for the simultaneous use of both eyes, as in "*binocular vision*," "a binocular telescope or microscope," etc. now "a binocular" is used as a noun, meaning a binocular microscope, a field-glass, &c.

\(^{2}\) See N. Quellien, *Chansons et danses des Bretons* (Paris, 1899), p. 39, and note, where the description of the instrument is not technical.

\(^{3}\) See *Le Goidic*, *Dictionnaire breton-français*, ed. by T. Hersart de la Villemarqué; and N. Quellien, *op. cit.* p. 37, note.

\(^{4}\) For examples of these see N. Quellien, *op. cit.* part ii.

\(^{8}\) For example, see N. Quellien, *op. cit.* part ii.
distant that the two perspectives formed by the naked eye are no more distinguished from each other, recourse may be had to binocular telescopes and range-finders; and if the objects be so small that, in order to observe details on them, we must bring our eyes so close to the objects that they cannot accommodate the images, recourse may be had to binocular microscopes and magnifying glasses.

The construction of binocular instruments dates back over several centuries, and has now been brought to great perfection. The subject of their theory and history has been exhaustively treated by M. von Rohr, *Die binokularen Instrumente* (Berlin, 1907), the first publication to present a complete account of these instruments.

**Binocular Instruments for Observation only.**—The first binocular telescope, consisting of two telescopes placed side by side, was constructed in 1608 by Johann Lipperhey, the inventor of the ordinary or Dutch telescope. The subject was next taken up by the monks. The Capuchin Antonius Maria Schyriläus (Schyril) de Rheita (1597-1660) described in 1645 the construction of double terrestrial telescopes. Greater success attended the efforts of the Capuchin Chérubin d'Oërons, who flourished at about the same time, and constructed large double telescopes of the Dutch type of high magnification, for use in war, and smaller instruments of lower magnification; these instruments were provided with mechanism for adjusting to the interval between the eyes of the observer (fig. 1). After these discoveries the subject received no more attention until the 19th century; no improvements of these instruments are recorded in the literature of the second half of the 18th century.

The re-invention of the Dutch binocular telescope apparently dates from 1823, and is to be assigned to the Viennese optician, Johann Friedrich Voigtlander (1790-1856); but the credit of having placed these instruments on the market probably belongs to J. P. Lemiére in Paris, who, in 1825, took out a French patent for an improvement of the Dutch double telescope. Lemiére's instruments were furnished with a common focusing arrangement, and the adapting to the inter-pupillary distance was effected by turning the two parallel telescopes round their common axis. The development of this instrument was studied by opticians for the remainder of the first half of the 19th century; the last improvement apparently was made by P. G. Bardou in 1834, and by H. Helmholzt in 1857 when he described the telestereoscope (fig. 2) with telescopic magnification. By utilizing the telescope with prism-inversion, devised in 1831 by Ignazio Porro (1795-1873), A. A. Boulanger succeeded in producing a binocular of an entirely new type in 1859 (fig. 3). But he overlooked the possibility of increasing the distance between the objectives; Camille Nachet introduced this improvement in 1875, but his instruments did not meet with much popularity. This was probably due to the fact that, at this time, the manufacture of the glass for the prisms was too difficult; this was overcome by E. Abbe, after the founding of the glassworks at Jena, who effected, independently of his predecessors, the wider separation of the objectives (fig. 4), and increased it in the telestereoscope (fig. 5), or relief telescope, in a manner nearly approaching to Helmholzt's proposal.

The first binocular microscope was invented by the previously mentioned Father Chérubin, whose instrument consisted of two inverting systems, and consequently gave a totally wrong impression of depth, i.e. depressions appeared as elevations, and vice versa, or, as we must say after Charles Wheatstone, it presented a pseudoscopic impression; this quality, however, was not recognized by the microscopists of the time. The instrument subsequently fell into complete neglect for nearly two centuries, to be revived in 1852 by Charles Wheatstone, who has stated that he had previously studied the problem; the publication of his views in his second great paper "On Binocular Vision," in the *Phil. Trans.* for 1852, undoubtedly stimulated the investigation of this instrument, which was carried on with zeal and success more especially in England and the United States. In 1853 the American J. L. Riddell (1807-1867) devised his binocular microscope, which contained the essentials of Wheatstone's pseudoscope. F. H. Wenham, another constructor, did not at first succeed in avoiding the pseudoscopic with the application of refracting dividing prisms, he subsequently arrived at orthoscopic representations and continued the development of the different methods for producing microphotographic stereograms; this was effected in the first case by placing a diaphragm over one half of the objective for each exposure, and in the second case by a suitable direction of the illuminating pencil (fig. 6). Of greater benefit, however, for stimulating interest in binocular microscopes, was his invention of reflecting dividing prisms (fig. 7). Other experiments, begun by Powell and Lealand, and developed with greater skill by Wenham, were concerned with the binocular vision of identical images. Such an impression could not possibly be stereoscopic, and these experiments led to the construction of a non-stereoscopic binocular microscope. Of the other workers in this field mention may be made

---

1 The first part appeared in 1838.
of Alfred Nachet, who in 1853, and subsequently in 1863, brought forward two forms of binocular microscope.

The earliest stages of the development of the binocular microscope had been always confined to those instruments with one objective, in the immediate neighbourhood of which the systems for dividing the pencil were placed. At a later date attempts were made to separate the two halves of the objective by modifying the eye-piece; this led to the construction of stereoscopic eye-pieces, initiated by R. B. Tolles, E. Abbe and A. Prazmowski. Of special importance is the work of Abbe; although, as he himself has stated, his methods accidentally led to the Wenham system, he certainly was far above his predecessors in his theoretical treatment of the problem, and in the perspicuity and clearness of his explanation. To him is also due the re-establishment of the instruments, which Wenham had abandoned by reason of too great technical difficulties (fig. 8). The newest form of the binocular microscope is very similar to the oldest form in which two completely separated tubes were employed. The inventor, H. S. Greenough, employs two systems for setting up the image, in order to avoid the pseudoscopic effect. After experiments in the Zeiss works, the erecting of Porro's prisms simultaneously permitted a convenient adaptation to the eye-distance of the observer.

The first binocular magnifying glass or simple microscope (German, Lupe) was devised by J. L. Riddell in 1853; in this instrument (fig. 9) the pencil of light is transmitted to the eyes by means of two pairs of parallel mirrors. Of the many different improvements mention may be made of A. Nachet's. II. Westen made use of two Chevalier-Brücke's simple microscopes with their long working distances in order to form an instrument in which the curvature of the image was not entirely avoided. Mention may also be made of the binoculars of K. Fritzsche (formerly Prokesh) and E. Berger. Binocular Instruments for Range-finding—For measuring purposes binocular telescopes with parallel axes are the only types employed. The measurement is effected by adjoining to the space or interval to be measured some means of measurement defined; for example, by a fixed scale which extends into the space, or by a movable point (Wandermarken). This instrument shows a transition to the stereoscope, inasmuch as the scale or means of measurement is not directly observed, but to each eye a plane representation is offered, just as in the stereoscope; the space to be measured, on the other hand, is portrayed in exactly the same way as in the double telescope. The method for superposing the two spaces on one another was deduced by Sir David Brewster in 1836, but he does not appear to have dealt with the problem of range-finding. The problem was attacked in 1861 by A. Rollet; later, in 1866, E. Mach published a promising idea, and finally—independently of the researches of his predecessors—Hector de Grousilliers, in partnership with the Zeiss firm (E. Abbe and C. Pfallrich), constructed the first stereoscopic range-finder suitable for practical use.

**BINOMIAL**

(from the Lat. bi-, bis, twice, and nominem, a name or term), in mathematics, a word first introduced by Robert Recorde (1557) to denote a quantity composed of the sum or difference to two terms; as \(a + b\), \(a - b\). The terms trinomial, quadrinomial, multinomial, &c., are applied to expressions composed similarly of three, four or many quantities.

The binomial theorem is a celebrated theorem, originally due to Sir Isaac Newton, by which any power of a binomial can be expressed as a series. In its modern form the theorem, which is true for all values of \(n\), is written as

\[
(x + a)^n = x^n + nx^{n-1}a + \frac{n(n-1)}{2!}x^{n-2}a^2 + \cdots + \frac{n(n-1)\cdots 2}{n!}a^n - \frac{n(n-1)\cdots 2}{n!}a^n - \cdots - a^n.
\]

The reader is referred to the article ALGEBRA for the proof and applications of this theorem; here we shall only treat of the history of its discovery.

The original form of the theorem was first given in a letter, dated the 13th of June 1676, from Sir Isaac Newton to Henry Oldenburg for communication to Wilhelm G. Leibnitz, although Newton had discovered it some years previously. Newton there states that \((p + pq)^n = a^n + \frac{n(n-1)}{2!}a^{n-2}b^2 + \frac{n(n-1)\cdots 2}{n!}a^{n-3}b^3 + \cdots + \frac{n(n-1)\cdots 2}{n!}a^n b^n \cdots c^n \cdots\), where \(p + pq\) is the quantity whose \(n\)th power or root is required, \(p\) the first term of that quantity, and \(q\) the quotient of the rest divided by \(p\); \(m\) the power, which may be a positive or negative integer or a fraction, and \(a, b, c, &c.,\) the several terms in order, e.g. \(a = p^n, b = m^3q^2c, e = m^2nq^4,\) and so on.

In a second letter, dated the 24th of October 1676, to Oldenburg, Newton gave the train of reasoning by which he devised the theorem.

"By the beginning of my mathematical studies, when I was persuading the works of the celebrated Dr Wallis, and considering the series by the interpolation of which he exhibits the area of the circle and hyperbola (for instance, in this series of curves whose common base or axis is \(x\), and the ordinates \(1 - xx\), \(1 - xx\), \(1 - xx\), \(1 - xx\), &c.), I perceived that if the areas of the alternate curves, which are \(xx - xx\), \(xx - xx\), \(xx - xx\), &c., could be interpolated, we should obtain the areas of the intermediate ones, the first of which \((1 - xx)\) is the area of the circle. Now in order to do this, it appeared that in all the series the first term was \(x\); that the second terms \(xx, xx, xx, \&c.,\) were in arithmetical progression; and consequently that the first two terms of all the series to be interpolated would be \(x - \frac{xx}{3} + \frac{xx}{3} - \frac{xx}{3} + \&c.,\) &c. . . . This rule I therefore applied to the series to be interpolated.

And since, in the series for the circle, the second term was \(\frac{xx}{3} + \frac{xx}{3} + \frac{xx}{3} + \&c.,\) I put \(m = \frac{xx}{3} + \frac{xx}{3} + \frac{xx}{3} + \&c.,\) &c. . . . And hence I found the required area of the circular segment to be \(x - \frac{xx}{3} + \frac{xx}{3} - \frac{xx}{3} + \&c.,\) &c. . . . And in the same manner might be produced the interpolated areas of other curves; as also the area of the hyperbola and the other alternates in this series \((1 - xx)^3, (1 - xx)^3, (1 - xx)^3, \&c.,\) &c. . . . Having proceeded so far, I considered that the terms \((1 - xx)^3, (1 - xx)^3, (1 - xx)^3, (1 - xx)^3, \&c.,\) of the hyperbola which are \(1, 1 - xx, 1 - xx, 1 - xx, \&c.,\) might be interpolated in the same manner as the areas generated by the ordinates, so that for this quantity to omit the denominators 1, 3, 5, 7, &c., in the terms expressing the areas; that is, the coefficients of the terms of the quantity to be interpolated \((1 - xx)^3\) or \((1 - xx)^3\), or generally \((1 - xx)^m\) will

---

The binomial theorem was thus discovered as a development of John Wallis's investigations in the method of \*interpolation.\* Newton gave no proof, and it was in the \*Art Conjectandi\* (1713) that James Bernoulli presented a general proof for integral values of the exponent. This theorem was first published, although Bernoulli must have discovered it many years previously. A rigorous demonstration was wanting for many years, Leonhard Euler's proof for negative and fractional values being faulty, and was finally given by Niels Heinrik Abel.

The \*multi-\* (or \*poly-\*) \*nomial theorem\* has for its object the expansion of any power of a multinomial and was discussed in 1697 by Abraham Demoivre (see \*Combinatorial Analysis.\*)

\*BINTURONG\* (\*Arctictis binturong\*), the single species of the viverrine genus \*Arctictis\*, ranging from Nepal through the Malay Peninsula to Sumatra and Java. This animal, also called the bear-cat, is allied to the palm-civets, or paradoxures, but differs from the rest of the family (\*Viverridae\*) by its tufted ears, and long, bushy, prehensile tail, which is thick at the root and almost equals in length the head and body together (from 28 to 33 inches). The fur is long and coarse, of a dull black hue with a grey wash on the head and fore-limbs. In habits the binturong is nocturnal and arboreal, inhabiting forests, and living on small vertebrates, worms, insects and fruits. It is said to be naturally fierce, but when taken young is easily tamed and becomes gentle and playful.

\*BINYON, LAURENCE\* (1869- ), English poet, born at Lancaster on the 9th of August 1869, was educated at St Paul's school, London, and Trinity College, Oxford. In 1898 he won the Newdigate prize in 1890 for his \*Persephone.\* He entered the department of printed books at the British Museum in 1893, and was transferred to the department of prints and drawings in 1895, the \*Catalogue of English Drawings in the British Museum\* (1898, &c.) being by him. As a poet he is represented by \*Lyric Poems\* (1894), \*Poems\* (Oxford, 1895), \*London Visions\* (2 vols., 1895-1898), \*The Praise of Life\* (1890), \*Porphyry and other Poems\* (1898), \*Odes\* (1900), \*The Death of Adam\* (1903), \*Penitacles\* (1902), \*Dream come true\* (1903), \*Paris and Oenone\* (1906), a one-act tragedy which he wrote in poetical drama (1907) as an art critic by monographs on the 17th-century Dutch etchers, on John Crome and John Sell Cotman, contributed to the \*Portfolio\* (1906). He published the first volume of a series of reproductions from William Blake, with a critical introduction. See also R. A. Streatfield, \*Two Poets of the New Century\* (1901), and W. Archer, \*Poets of the Younger Generation\* (1902).

\*BIO-BIO\*, a river of southern Chile, rising in the Ñino Hachado pass across the Andes, 38° 43' S. lat., and flowing in a general north-westerly direction to the Pacific at Concepción, where it is 2 m. wide and forms an excellent harbour. It has a total length of about 275 m., nearly one half of which is navigable.

\*BIO-BIO\*, an inland province of southern Chile, bounded N., W. and S. respectively by the provinces of Concepción, Arauco and Malleco, and E. by Argentina. It has an area of 5,246 sq. m. of well-wooded and mountainous country, and exports timber to a large extent. The great trunk railway from Santiago S. to Puerto Montt crosses the western part of the province and also connects it with the port of Concepción. The capital, Los Angeles (est. pop. 7,777 in 1902) lies 123° 5' E. of this railway and is connected with it by a branch line.

\*BIogenesis\* (from the Gr. \*bios\*, life, and \*γενεσις\*, generation, birth), a biological term for the theory according to which each living organism, however simple, arises by a process of budding, fission, spore-formation of sexual reproduction from a parent organism. Under the heading of \*Abiogenesis\* (q.v.) is discussed the series of steps by which the modern acceptance of biogenesis and rejection of abiogenesis has been brought about. No biological generalization rests on a wider series of observations, or has been subjected to a more critical scrutiny than that every living organism has come into existence from a living portion or parent, either animal, vegetable, or even fossil, or to a plant.

The articles \*Reproduction\* and \*Heredity\* the details of the relations between parent and offspring are discussed. There remains for treatment here a curious collateral issue of the theory. It is within common observation that parent and offspring are alike: that the new organism resembles that from which it has come into existence: in fine, biogenesis is homogenesis. Every organism takes origin from a parent organism of the same kind. The conception of homogenesis, however, does not imply an absolute similarity between parent and offspring, but only that they project in the same manner that the normal life-cycle of plants and animals exhibits what is known as alternation of generations, so that any individual in the chain may resemble its grand-parent and its grand-child, and differ markedly from its parent and child. Next, any organism may pass through a series of free-living larval stages, so that the new organism at first resembles its parent only very remotely, corresponding to an early stage in the life-history of that parent. (See \*Embryology, Larval Forms and Reproduction.\*) Finally, the conception of homogenesis does not exclude the differences between parent and offspring for these are in general affected by the general conditions prevailing when the organism is formed. This is the case of organisms in the course of evolution (see \*Variation and Selection.\*) Homogenesis means simply that such organism comes into existence directly from a parent organism of the same race, and hence of the same species, sub-species, genus and so forth.

From time to time there have been observers who have maintained a belief in the opposite theory, to which the name heterogenesis has been given. According to the latter theory, the offspring of a given organism may be utterly different from itself, so that a known animal may give rise to another known animal with a different form and a different life. In the first place, the normal life-cycle of plants and animals exhibits what is known as alternation of stocks in the course of evolution (see \*Variation and Selection.\*).

\*Biography\* (from the Gr. \*βιος\*, life, and \*γραφειν\*, writing), that form of history which is applied, not to races or masses of men, but to an individual. The earliest use of the word \*βιογραφία\* is attributed to Damascius, a Greek writer of the beginning of the 4th century, and in \*Latin biographia\* was used, but in \*English\* the earlier employment of the word, "biography," has been traced than that of Dryden in 1683, who uses it to describe the literary work of Plutarch, "the history of particular men's lives." It is obvious that this definition is necessary, for biography is not the record of "life" in general, but of the life of a single person. The idea of the distinction between this and history is a modern thing; we speak of "antique biography," but it is doubtful whether any writer of antiquity, even Plutarch, clearly perceived its possible existence as an independent branch of literature. All of them, and Plutarch certainly, considered the writing of a man's life as an opportunity for celebrating, in his person, certain definite moral qualities. It was in these, and not in the individual characteristics of the man, that his interest as a subject of biography resided.

The true conception of biography, therefore, as the faithful portrait of a soul in its adventures through life, is very modern.
We may question whether it existed, save in rare and accidental instances, until the 17th century. The personage described was, in earlier times, treated either from the philosophical or from the historical point of view. In the former case, rhetoric inevitably clouded the definitions of the picture; the object was to produce a grandiose moral effect, to clothe the subject with all the virtues or with all the vices, to make his career a splendid example or else a solemn warning. The consequence is that we have to piece together unconsidered incidents and the accidental record of features in order to obtain an approximate estimate. We may believe, for instance, that a faithful and unprejudiced study of the emperor Julian, from the life, would be a very different thing from the impression left upon us by the passions of Cyril or of Theodoret. In considering what biography, in its pure sense, ought to be, we must insist on what it is not. It is not a philosophical treatise nor a polemical pamphlet. It is not, even, a portion of the human contemporary chronicle. Broad views are entirely out of place in biography, and there is perhaps no greater literary mistake than to attempt what is called the “Life and Times” of a man. In an adequate record of the “times,” the man is bound to sink into significance; even a “Life and Times” of Napoleon I. would be an impossible task.

History deals with fragments of the vast roll of events; it must always begin abruptly and close in the middle of affairs; it must always deal, impartially, with a vast number of persons. Biography is a study sharply defined by two definite events, birth and death. It fills its canvas with one figure, and other personages, however great in themselves, must always be subordinate to the personal hero. The peculiar interest of the literal rhetorical purpose of “lives” which clearer modern purpose can afford to retain is the relative light thrown on military or intellectual or social genius by the achievements of the selected subject. Even this must be watched with great care, lest the desire to illuminate that genius, and make it consistent, should lead the biographer to glose over frailties or obscurity irregularities. In the old “lives” of great men, this is precisely what was done. If the facts did not lend themselves to the great initial thesis, so much the worse for them. They must be ignored or falsified, since the chief object of the work was to “teach a lesson,” to magnify a certain tendency of conduct. It was very difficult to persuade the literary world that, whatever biography is, it is not an opportunity for panegyric or invective, and the lack of this perception destroys our faith in most of the records of personal life in ancient and medieval times. It is impossible to avoid suspecting that Suetonius loaded his canvas with black in order to excite hatred against the Roman emperors; it is still more difficult to accept more than one page in three of the stories of the professional hagiographers. As long as it was a pious merit to deform the truth, biography could not hope to flourish. It appears to have originally asserted itself when the primitive instinct of sympathy began to have free play, that is to say, not much or often before the 17th century. Moreover, the peculiar curiosity which legitimate biography satisfies is essentially a modern thing; and presupposes our observation of life not unduly clouded by moral passion or prejudice.

Among the ancients, biography was not specifically cultivated until comparatively later times. The lost “Lives” of Critias were probably political pamphlets. We meet first with deliberate biography in Xenophon’s memoirs of Socrates, a work of apologetic value. Towards the close of the 1st century, Plutarch wrote one of the most fascinating books in the world’s literature, his Parallel Lives of 46 Greeks and Romans. In later Greek, the Life of Apollonius of Tyana was written by Philostratus, who also produced a Lives of the Sophists. In the 3rd century, Diogenes Laertius compiled a Lives of the Philosophers, which is of greater interest than a Lives of the Sophists composed a hundred years later by Eunapius. Finally in the 10th century, Suidas added a biographical section to his celebrated Lexicon. In Latin literature, the earliest biography we meet with is the fragment of the Illustrious Men of Cornelius Nepos. Memoirs began to be largely written at the close of the Augustan age, but these, like the Life of Alexander the Great, by Q. Curtius Rufus, were rather historical than biographical. Tacitus composed a life of his father-in-law, Agricola; this is a work of the most elegant and stately beauty. Suetonius was the author of several biographical compilations, of which the Lives of the Twelve Caesars is the best-known; this was produced in the year 130. Marius Maximus, in the 4th century, continued the series of emperors down to Heliogabalus, but his work has not been preserved. The Augustan History, finished under Constantine, takes its place, and was concluded and edited by Flavius Vopiscus.

Biography hardly begins to exist in English literature until the close of the reign of Henry VIII. William Roper (1460-1578) wrote a touching life of his father-in-law, Sir Thomas More, and George Cavendish (1500-1561), a memoir of Cardinal Wolsey which is a masterpiece of liveliness and grace. It is with these two works, both of which remained in manuscript until the 17th century, that biography in England begins. The lives of English writers compiled by John Bale (1495-1561) are much more primitive and slight. John Leland (d. 1552) and John Flit (1560-1616) were antiquaries who affected a species of biography. In the early part of the 17th century, the absence of the habit of memoir writing extremely impoverishes our knowledge of the illustrious authors of the age, of none of whom there are preserved such records as our curiosity would delight in. The absence of any such chronicle was felt, and two writers, Thomas Heywood and Sir Aston Cokayne, proposed to write lives of the poets of their time. Unfortunately they never carried out their plans, extant portions of their English biography was Laok Walton, who, in 1640, published a Life of Donne, followed in 1651 by that of Sir Henry Wotton, in 1655 by that of Richard Hooker, in 1670 by that of George Herbert, and in 1678 by that of Dr Robert Sanderson. These five reprinted, under the title of Walton’s Lives, were not only charming in themselves, but the forerunners of a whole class of English literature. Meanwhile, Fuller was preparing his History of the Worthies of England, which appeared after his death, in 1662, and John Aubrey (1666-1697) was compiling his Minutes of Lives, which show such a perfect comprehension of the personal element that should underlie biography; these have only in our own days been completely given to the public. Edward, Lord Herbert of Cherbury (1583-1648), wrote a brilliant autobiography, first printed in 1704; that of Anne Harrison, Lady Fanshawe (1625-1680), remained unknown until 1829. A very curious essay in biography is the memoir of Colonel John Hutchinson, written by his widow, Lucy, between 1664 and 1671. Margaret Lucas, duchess of Newcastle (1624-1674), wrote her own life (1656) and that of her duke (1667). The Athenae Oxonienses of Anthony a Wood (1632-1685) was a complicated celebration of the wit, wisdom and learning of Oxford colleges and societies, and, in especial, of the universities after the Reformation. In 1668 Thomas Sprat (1635-1713) wrote a Life of Cowley, which was very much admired and which exercised for many years a baneful influence on British biography. Sprat considered that all familiar anecdote and picturesque detail should be omitted in the composition of a memoir, and that moral effect and a solemn veneration should be aimed at. The celebrated funeral orations of Jeremy Taylor were of the same order of eloquence, and the wind of these grandiose compositions destroyed the young shoot of genuine and simple biography, which had budded in Walton and Aubrey.

From this time forth, for more than half a century, English biography became a highly artificial and rhetorical thing, lacking all the salient features of honest portraiture. William Oldys (1606-1701) was the first to speak out boldly; in 1747, in the preface to the Biographia Britannica, he pointed out that the cruelty, we might even say the impiety, of sacrificing the glory of great characters to trivial circumstances and mere convenience, and attacked the timid and scrupulous superficiality of those who undertook to write lives of eminent men, while omitting everything which gave definition to the portrait. In 1753 the Lives of the Poets, which bore the name of Theophilus Cibber (1703-1758), but was mainly written by Robert Shiel...
In Italian literature, biography does not take a prominent place until the 15th century. The Lives of Illustrious Florentines, in which a valuable memoir of Dante occurs, was written in Latin by Filippo Villani. Vaspiasiano da Bistrici (1421-1498) compiled a set of biographies of his contemporaries, which are excellent of their kind. The so-called Life of Castuccio Castuccini, by Machiavelli, is hardly a biography, but a brilliant essay on the ideals of statescraft. Paolo Giovi (1685-1752) wrote the lives of poets and soldiers whom he had known. All these attempts, however, seem insignificant by the side of the autobiography of Benvenuto Cellini (1501-1571), confessedly one of the most entertaining works of the world's literature. A great deal of biography is scattered throughout the historical compilations of the Italian renaissance, and the Lives of the Artists, by Giorgio Vasari (1512-1574), is a storehouse of anecdotes admirably told. We find nothing else that requires special mention till we reach the memoir-writers of the 18th century, with the autobiographies of Count Carlo Gozzi and Aliferi; and on the whole, Italy, although adopting in the 10th century the habit of biography, has rarely excelled in it.

In Spanish literature Fernán Pérez de Guzmán (1378-1460), with great originality, enshrined, in his Generations and Like-nesses, a series of admirable literary portraits; he has been called the Plutarch of Spain. But, in spite of numerous lives of saints, poets and soldiers, Spanish literature has not excelled in biography, nor has it produced a single work of this class which is universally read. In Germany there is little to record before the 18th century, except the Life of the Poet and Printer Martin Lützel, by Pfaff, published in 1661. Though the ancient biographies of the Middle Ages were based on tradition, the Renaissance biographers set their biographies on a firm foundation. The Life of Erasmus by spokesman, 1525, contains a remarkable collection of biographical information, much of it hitherto unknown or lost. The 18th century was the great age of biography. The Memoirs of Voltaire (1740-1749) contains an excellent biographical section of a general character. The biographies of the 18th century are almost as numerous as the memoirs of the 19th century. The Memoirs of the Most Illustrious Personages of the Earth (1755), by antibody, is a set of biographies which contains a vast amount of information, and which is still the best collection of biographies in the English language. The Memoirs of the Most Illustrious Personages of the Earth (1755), by antibody, is a set of biographies which contains a vast amount of information, and which is still the best collection of biographies in the English language.

In the course of the 19th century a new thing in biography was invented, in the shape of dictionaries of national biography. Of these, the first which was carried to a successful conclusion was the Swedish (1835-1837), which occupied 23 volumes. This dictionary was followed by the Dutch (1852-1878), in 24 volumes; the Austrian (1852-1868), in 35 volumes; the Belgian (which was begun in 1866); the German (1875-1900), in 45 volumes; and others, representing nearly all the countries of Europe. England was behind the competitors named above, but when she joined the ranks a work was produced the value of which can hardly be exaggerated. The project was started in 1857 by the publisher George Smith (1824-1901), who consulted Mr (afterwards Sir) Leslie Stephen. The first volume of the English Dictionary of National Biography was published on the 1st of January 1857, under Stephen's editorship. A volume was published quarterly, with complete punctuality until Midsummer 1900, when volume 63 closed the work, which was extended by the issue of three supplementary volumes. In May 1891 Leslie Stephen resigned the editorship and was succeeded by Mr Sidney Lee, who conducted the work to its prosperous close, bringing it up to the death of Queen Victoria. The Dictionary of National Biography contains the lives of more than 30,000 persons, and has proved of inestimable service in elucidating the private annals of the British people.

(T. G.)

BIOLOGY (Gr. βιος, life). The biological sciences are those which deal with the phenomena manifested by living matter; and though it is customary and convenient to group apart such of these phenomena as are termed mental, and such of them as are exhibited by men in society, under the heads of psychology and sociology, yet it must be allowed that the natural boundary separates the subject matter of the latter sciences from that of biology. Psychology is inseparably linked with physiology; and the phases of social life exhibited by animals other than man, which sometimes curiously foreshadow human policy, fall strictly within the province of the biologist.

On the other hand, the biological sciences are sharply marked off from the abiological, or those which treat of the phenomena manifested by not-living matter, in so far as the properties of living matter distinguish it absolutely from all other kinds of things, and as the present state of knowledge furnishes us with no link between the living and the not-living.
The distinctive properties of living matter are—

1. Its chemical composition—containing, as it invariably does, one or more forms of a complex compound of carbon, hydrogen, oxygen and nitrogen, the so-called protein or albumin (which has never yet been obtained except as a product of living bodies), united with a large proportion of water, and forming the chief constituent of a substance which, in its primary unmodified state, is known as protoplasm.

2. Its universal disintegration and waste by oxidation; and its concomitant reintegration by the intussusception of new mass, resulting in the recombination of the molecules of the protoplasm, in virtue of which they break up into more highly oxidized products, which cease to form any part of the living body, is a constant comitant of life. There is reason to believe that carbonic acid is always one of these waste products, while the others contain the remainder of the carbon, the nitrogen, the hydrogen and the other elements which may enter into the composition of the protoplasm.

The new matter taken in to make good this constant loss is either a ready-formed protoplasmic material, supplied by some other living being, or it consists of the elements of the unchanged, or the simpler combinations, which consequently have to be built up into protoplasm by the agency of the living matter itself. In either case, the addition of molecules to those which already existed takes place, not at the surface of the living mass, but by interposition between the existing molecules of the latter. If the processes of disintegration and of reconstruction which characterize life balance one another, the size of the mass of living matter remains stationary, while, if the reconstructive process is the more rapid, the living body grows. But the increase of size which constitutes growth is the result of a process of molecular intussusception, and therefore differs altogether from the process of growth by accretion, which may be observed in crystals and is effected purely by the external addition of new matter—so that, in the well-known aphorism of Linnaeus, the word "growth" as applied to stones signifies a totally different process from what is called "growth" in plants and animals.

3. Its tendency to undergo cyclical changes.

In the ordinary course of nature, all living matter proceeds from pre-existing living matter, a portion of the latter being detached and acquiring an independent existence. The new form takes on the characteristic properties of the one from which it arose; exhibits the same power of propagating itself by means of an offshoot; and, sooner or later, like its predecessor, ceases to live, and is resolved into more highly oxidized compounds of its elements.

Thus an individual living body is not only constantly changing its substance, but its size and form are undergoing continual modifications, the end of which is the death and decay of that individual; the continuation of the kind being secured by the detachment of portions which tend to run through the same cycle of forms as the parent. No forms of matter which are either not living, or have not been derived from living matter, exhibit these three properties, nor any approach to the remarkable phenomena defined under the second and third heads. But in addition to these distinctive characters, living matter has some other peculiarities, the chief of which are the dependence of all its activities upon moisture and upon heat, within a limited range of temperature, and the fact that it usually possesses a certain structure or organization.

As has been said, a large proportion of water enters into the composition of all living matter; a certain amount of drying arrests vital activity, and the complete abstraction of this water is absolutely incompatible with either actual or potential life. But many of the simpler forms of life may undergo desiccation to such an extent as to arrest their vital manifestations and convert them into the semblance of not-living matter, and yet remain potentially alive. That is to say, on being duly moistened they return to life again. And this revivification may take place after months, or even years, of arrested life.

The properties of living matter are intimately related to temperature. Not only does exposure to heat sufficient to coagulate protein matter destroy life, by demolishing the molecular structure upon which life depends; but all vital activity, all phenomena of nutritive growth, movement and reproduction are possible only between certain limits of temperature. These limits may be set down as from a little above the freezing point of water to a little below the boiling point. It is to be noted, however, that these limits apply to the living matter itself, and many of the apparent exceptions are due to cases in which the living substance has frozen, or has undergone the process of existing heat and cold. In many low organisms, such as the spores of bacteria, the thick, non-conducting wall may preserve the living protoplasm from subjection to external temperatures below freezing point, or above boiling point, but all the evidence goes to show that applications of such cold or heat, if prolonged or arranged so as to penetrate to the living matter, destroy life. In warm-blooded animals, such as birds and mammals, protective mechanisms for the regulation of temperature enable them to endure exposure to extreme heat or cold, but in such cases the living cells do not appreciably rise or fall in temperature. A variation of a very few degrees in the blood itself produces death.

Recent investigations point to the conclusion that the immediate cause of the arrest of vitality, in the first place, and of its destruction, in the second, is the coagulation of certain substances in the protoplasm, and that the latter contains various coagulable matters, which solidify at different temperatures. And it remains to be seen, how far the death of any form of living matter, at a given temperature, depends on the destruction of its fundamental substance at that heat, and how far death is brought about by the coagulation of merely accessory compounds. It may be safely said of all those living things which are large enough to enable us to trust the evidence of microscopes, that they are heterogeneous optically, and that their different parts, and especially the surface layer, as contrasted with the interior, differ physically and chemically; while, in most living things, mere heterogeneity is exchanged for a definite structure, whereby the body is distinguished into visibly different parts, which possess different powers or functions. Living things which present this visible structure are said to be organized; and so widely does organization obtain among living beings, that organized and living are not infrequently used as if they were terms of co-extensive applicability. This, however, is not exactly accurate, if it be thereby implied that all living things have a visible organization, as there are numerous forms of living matter of which it cannot properly be said that they possess either a definite structure or permanently specialized organs: though, doubtless, the simplest particle of living matter must possess a highly complex molecular structure, which is far beyond the reach of vision.

The broad distinctions which, as a matter of fact, exist between every known form of living substance and every other component of the material world, justify the separation of the biological sciences from all others. But it must not be supposed that the differences between living and not-living matter are such as to justify the assumption that the forces at work in the one are different from those which are to be met with in the other. Considered apart from the phenomena of consciousness, the phenomena of life are all dependent upon the working of the same physical and chemical forces as those which are active in the rest of the world. It may be convenient to use the terms "vitality" and "vital force," to denote the causes of certain great groups of natural operations, as we employ the names of "electricity" and "electrical force" to denote others; but it ceases to be proper to do so, if such a name implies the absurd assumption that "electricity" and "vitality" are entities playing the part of efficient causes of electrical or vital phenomena. A mass of living protoplasm is simply a molecular machine of great complexity, the total results of the working of which, or its vital phenomena, depend—on the one hand,
BION—BIOT

upon its construction, and, on the other, upon the energy supplied to it; and to speak of "vitality" as anything but the name of a series of operations is as if one should talk of the "horology" of a clock.

Living matter, or protoplasm and the products of its metamorphosis, may be regarded under four aspects:—

1. It has a certain external and internal form, the latter being more usually called structure; and

2. It occupies a certain position in space and in time.

3. It is the subject of the operation of certain forces in virtue of which it undergoes internal changes, modifies external objects, and is modified by them; and

4. Its form, place and powers are the effects of certain causes.

In correspondence with these four aspects of its subject, biology is logically divisible into four chief subdivisions—

I. MORPHOLOGY; II. DISTRIBUTION; III. PHYSIOLOGY; IV. AETIOLOGY.

Various accidental circumstances, however, have brought it about that the actual distribution of scientific work does not correspond with the logical subdivisions of biology. The difference in technical methods and the historical evolution of teaching posts (for in all civilized countries the progress of biological knowledge has been very closely associated with the existence of institutions for the diffusion of knowledge and for professional education) have been the chief contributory causes to this practical confusion. Details of the morphology of plants will be found in the chapters relating to the chief groups of plants, those of animals in the corresponding articles on groups of animals, while the classification of animals adopted in this work will be found in the article ZOOLOGY. Distribution is treated of under ZOOLOGICAL DISTRIBUTION, PLANKTON, PALAENTOLOGY and PLANTS: DISTRIBUTION. PHYSIOLOGY and its allied articles deal with the subject generally and in relation to man, while the special physiology of plants is dealt with in a section of the article PLANTS. AETIOLOGY is treated of under the heading EVOLUTION. But practical necessity has given rise to the existence of many other divisions; see CYTOLOGY, for the structure of cells; EMBRYOLOGY, for the development of individual organisms; HEREDITY and REPRODUCTION, for the relations between parents and offspring. (T. H. H.; P. C. M.)

BION, Greek bucolic poet, was born at Phlosa near Smyrna, and flourished about 100 B.C. The account formerly given of him, that he was the contemporary and imitator of Theocritus, the friend and tutor of Moschus, and lived about 380 B.C., is now generally regarded as incorrect. W. Stein (De Moschi et Bionis Actate, Tübingen, 1893) puts Bion, chiefly on metrical grounds, in the first half of the 1st century B.C. Nothing is known of him except that he lived in Sicily. The story that he died of poison, administered to him by some jealous rivals, who afterwards suffered the penalty of their crime, is probably only an invention of the author of the Enarrations Bionis (see Moschus). Although his poems are included in the general class of bucolic poetry, the remains show little of the vigour and truthfulness to nature characteristic of Theocritus. They breathe an exaggerated sentimentality, and show traces of the overstrained reflection frequently observable in later developments of pastoral poetry. The longest and best of them is the Lament for Adonis ('Enarrations 'Aδωνις), which refers to the death of the festival of Adonis (q.v.), on which the death of the favourite of Aphrodite was lamented, the former being introduced to the Adoniasucis of Theocritus, the subject of which is the second day, when the reunion of Adonis and Aphrodite was celebrated. Fragments of his other pieces are preserved in Stobaeus; the epithalamium of Achilles and Deidameia is not his.

Bion and Moschus have been edited separately by G. Hermann (1849) and C. Ziegler (Tübingen, 1866), the Epitaphios Adonis by H. L. Ahrens (1854) and E. Hiller in Beiträge zur Textgeschichte der griechischen Bukoliker (1888). Bion's poems are generally included in the editions of Theocritus. There are English translations by J. Banks (1853) in Bohn's Classical Library, and by Andrew Lang (1889), with Theocritus and Moschus; there is an edition of the text by U. Willamowitz-Möllendorff in the Oxford Scriptum Classicorum Bibliotheca (1905). On the date of Bion see F. Bücheler in Rheinisches Museum, xxx, (1875), pp. 33-41; also G. Knäck in Pauly-Wissowa's Realenzyklopaedie, s.v.; and F. Susemihl, Geschichte der griechischen Literatur in der Alexandrinerzeit, i. (1891), p. 233.

BION, of Borysthenes (Olbia), in Sardinia, Greek moralist and philosopher, flourished in the first half of the 3rd century B.C. He was of low origin, his mother being a courtesan and his father a dealer in salt fish, with which he combined the occupation of smuggling. Bion, when a young man, was sold as a slave to a rhetorician, who gave him his freedom and made him his heir. After the death of his patron, Bion went to Athens to study philosophy. Here he attached himself in succession to the Academy, the Cynics, the Cyrenaics and the Amorics. One of his teachers was the Cyrenaicus Theodorus, called "the atheist," whose influence is clearly shown in Bion's attitude towards the gods. After the manner of the sophists of the period, Bion travelled through Greece and Macedonia, and was admitted to the literary circle at the court of Antigonus Gonatas. He subsequently taught philosophy at Rhodes and died at Chalcis in Euboea. His life was written by Diogenes Laertius. Bion was essentially a popular writer, and in his Diatribae he satirized the follies of mankind in a manner calculated to appeal to the sympathies of a low-class audience. While eulogizing poverty and philosophy, he attacked the gods, the wealthy, the astrologers, and the wealthy, and denied the efficacy of prayer. His influence is distinctly traceable in succeeding writers, e.g., in the satires of Menippus. Horace (Epistles, ii. 2. 60) alludes to his satires and caustic wit (sal nigrum). An idea of his writings can be gathered from the fragments of Teles, a cynic philosopher who lived towards the end of the 3rd century, and who made great use of them. Specimens of his apophthegms may be found in Diogenes Laertius and the florilegium of Stobaeus, while there are traces of his influence in Seneca.

See Hegr, De Vita, Doctrina, et Scientia Bionis (1821); Rossignol, Fragmenta Bionis Borysthenitae (1830); Heine, De Horatio Bionis Imitatore (1889).

BIOT, JEAN BAPTISTE (1774-1862), French physicist, was born at Paris on the 21st of April 1774. After serving for a short time in the artillery, he was appointed in 1797 professor of mathematics at Beauvais, and in 1800 he became professor of physics at the Collège de France, through the influence of Laplace, from whom he had sought and obtained the favour of reading the proof sheets of the Mécanique céleste. Three years later, at an unusually early age, he was elected a member of the Academy of Sciences, and in 1804 he accompanied Gay Lussac on the first balloon ascent undertaken for scientific purposes. In 1806 he was associated with J. J. D. Arago, with whom he had already carried out investigations on the refractive properties of different gases, in the measurement of an arc of the meridian in Spain, and in subsequent years he was engaged in various other geodetic determinations. In 1814 he was made chevalier and in 1890 commander, of the Legion of Honour. He failed in his ambition of becoming perpetual secretary of the Academy of Sciences, but was somewhat consoled by his election as a member of the French Academy in 1856. He died in Paris on the 3rd of February 1862. His researches extended to almost every branch of physical science, but his most important work was of an optical character. He was especially interested in questions relating to the polarization of light, and his observations in this field, which gained him the Rumford medal of the Royal Society in 1840, laid the foundations of the polarimetric analysis of light. Biot was an extremely prolific writer, and besides a great number of scientific memoirs, biographies, &c., his published works include: Analyse de la mécanique céleste de M. Laplace (1807); Traité analytique des courbes et des surfaces du second degré (1808); Recherches sur l'intégration des équations différentielles partielles et sur les vibrations des surfaces (1803); Traité de physique (1816); Recueil d'observations géodésiques, astronomiques et physiques exécutées en Espagne et Écosse, with Arago (1821); Mémoire sur la vraie constitution de l'atmosphère terrestre (1841); Traité élémentaire d'astronomie physique (1805); Recherches sur
BIOTITE—BIRBHUM

The colour is usually dark-green or brown; thick crystals are often deep-black and opaque. The absorption of light-rays vibrating parallel to the cleavage is much greater than of rays vibrating in a direction perpendicular thereto, and in dark-coloured crystals the former are almost completely absorbed. The angle between the optic axes is usually very small, the crystals being often practically uniaxial; an axial angle of 90° has, however, been recorded in a dark-coloured biotite. The specific gravity of biotite is, as a rule, higher than that of other micas, varying from 2.7 to 3.5; according to the amount of iron present. The hardness is 2 to 3.

Several varieties of biotite are distinguished. By G. Tschermak it is divided into two classes, merozene and anomite; in the former the plane of the optic axis coincides with the plane of symmetry, whilst in the latter it is perpendicular thereto. Merozene includes nearly all ordinary biotite, and is the name given by A. Breithaupt in 1841 to the Vesuvian crystals; on the other hand, anomite (named from ἀνομία, "contrary to law") is of rare occurrence. Haughtonite and siderophyllite are black varieties rich in ferrous iron, and lepidomelane (from hermis, a scale, and μέλας, black) is a variety rich in ferric iron. In barytobiotite and manganophyllite the magnesia is partly replaced by baryta and manganous oxide respectively. Rubellite, hydrobiotite, pseudobiotite, and others are altered forms of biotite, which is a mineral particularly liable to decomposition with the production of chlorites and vermicules.

Biotite is a common constituent of igneous and crystalline rocks: in granite, gneiss and mica-schist it is often associated with muscovite (white mica), the two kinds having sometimes grown in parallel position. In volcanic rocks, and in nearly all other kinds of igneous rocks with the exception of granite, biotite occurs to the exclusion of the muscovite. In the dyke-rocks known as mica-traps or mica-lamprophyres biotite is especially abundant. It is also one of the most characteristic products of contact-metamorphism, being developed in sedimentary and other rocks at their contact with granite masses. In the ejected blocks of crystalline limestone of Monte Somma, Vesuvius, the most perfectly developed crystals of biotite (figs. 1, 2), or indeed of any of the micas, are found in abundance, associated with brilliant crystals of augite, olivine, humite, &c.

Biotite is a characteristic black mica. It is a very common and widely distributed white mica, yet it is of far less economic importance. The small size of the sheets, their dark colour and want of transparency render the material of little value. Large, cleavable masses yielding fine smoky-black and green sheets, sufficiently elastic for industrial purposes, are, however, found in Renfrew county, Ontario.

(See BIRBHUM, a district of British India in the Burdwan division of Bengal, situated in the Gangetic plain and partly on the hills, being bounded on the south by the river Ajay. The administrative headquarters are at Suri, which is the only town in the district. The area comprises 7532 sq. m. The eastern portion of the district is the ordinary alluvial plain of the Gangetic delta; the western part consists of undulating beds of laterite resting on a rock basis, and covered with small scrub jungle. The Ajay, Bhekashwar and Mor or Morausshe, are the principal rivers of the district, but they are merely hill streams and only navigable in the rains. In 1901 the population was 962,280, showing an increase of 13.5% in the decade. The principal industry is the spinning and weaving of silk, chiefly from tussur or jungle silk-worms. There are also several lac factories. The loop-line of the East Indian railway runs through the district, with a junction at Nahalti for Murshidabad.)

History.—Birbhum in the early part of the 13th century was a Hindu state, with its capital at Rajnagar or Nagar. In the course of the century it was conquered by the Pathans and formed part of the Pathan kingdom of Bengal. At the beginning of the 18th century it appears as a kind of military fief held under the nawab of Murshidabad by one Asadullah Pathan, whose family had probably been settled here since the fall of the Pathan dynasty of Bengal in 1600. It passed into British possession in 1765, but the East India Company did not assume its direct government until 1787, when that course became necessary. In the interval it had been a prey to armed bands from the highlands of Chota Nagpur, with whom the raja was unable to cope, and who practically brought the trade of the Company in the district to a standstill. The two border principalities of Birbhum and Bankura were accordingly united into a district under a British collector, being, however, separated again in 1793. By 1780, after...
BIRCH
cconsiderable trouble, the marauders were driven back into their
mountains, and since that time (except during the Santal rising of
1855) the district has been one of the most peaceful and
prosperous in India.

BIRCH, SAMUEL (1813-1889), English Egyptologist and
antiquary, was born on the 3rd of November 1813, being the
son of the rector of St Mary Woolnoth, London. From an early
age he manifested a tendency to the study of out-of-the-way
subjects, and after a brief employment in the Record Office
obtained in 1836 an appointment in the antiquities department of
the British Museum, and he became a fellow of the Society of
Antiquaries. He extended his researches to Egyptian, and when the
cumbersome department came to be divided he was appointed to
the charge of the Egyptian and Assyrian branch. In the latter
language he had assistance, but for many years there was only
one other person in the institution—in a different department—who
knew anything of ancient Egyptian, and the entire arrangement
of the department devolved upon Birch. He found time
nevertheless for Egyptological work of the highest value, includ-
ing a hieroglyphical grammar and dictionary, translations of
The mummy and the papyrus, and numerous catalogues and guides. He
further wrote what was long a standard history of pottery, investigated the Cypriote syllabary,
and proved by various publications that he had not lost his old
interest in Chinese. Paradoxical in many of his views: on things in
general, he was sound and cautious as a philologist; while
learned and laborious, he possessed much of the instinctive
divination of genius. He died on the 27th of December 1885.

BIRCH, THOMAS (1705-1760), English historian, son of
Joseph Birch, a coffee-mill maker, was born at Clerkenwell on the
23rd of November 1705. He preferred study to business, but as his
parents were Quakers he did not go to the university. Not-
withstanding this circumstance, he was ordained deacon in the
Church of England in 1730 and priest in 1731. As a strong
supporter of the Whigs, he gained the favour of Philip Yorke,
afterwards lord chancellor and first earl of Hardwicke, and his
subsequent preferences were largely due to this friendship. He
held successively a number of benefices in different counties,
and finally in London. In 1735 he became a member of the
Society of Antiquaries, and was elected a fellow of the Royal
Society, of which he was secretary from 1752 to 1765. In 1738 he
had the honour of marriage, to whom he devoted himself. He
was killed on the 9th of January 1766 by a fall from his horse,
and was buried in the church of St Margaret Pattens, London,
of which he was then rector. He left his books and manuscripts to
the British Museum, and a sum of about £500 to increase the
salaries of the three assistant librarians.

Birch had an enormous capacity for work and was engaged in a
large number of literary undertakings. In spite of their dulness
many of his works are of considerable value, although Horace
Walpole questioned his "parts, taste and judgment." He
carried on an extensive correspondence with some of the leading
men of his time, and many of his letters appear in Literary
Anecdotes of the 18th Century (London, 1812-1815) and Ilustraciones
of the Literary History of the 18th Century (London, 1817-1858)
(London, 1780-1790), and in Boswell's Life of Johnson. Birch
wrote most of the English lives in the General Dictionary,
Historical and Critical, 10 vols. (London, 1734-1741), assisted in
the composition of the Athenian Letters (London, 1810), edited the
State Papers of John Thurloe (London, 1743) and the State
Papers of W. Murdin (London, 1759). He also wrote a Life of the
Right Honourable Robert Boyle (London, 1754); Inquiry into the
share which King Charles I. had in the transactions of the Earl of
Glamorgan for bringing over a body of Irish rebels (London, 1756);
Historical view of Negotiations between the Courts of England,
France and Brussels 1592-1617 (London, 1749); Life of Arch-
bishop Tillarton (London, 1753); Memoirs of the Reign of Queen
Elizabeth from 1581 (London, 1754); History of the Royal
Society of London (London, 1756-1757); Life of Henry, Prince of
Wales (London, 1760), and many other works. Among the
papers left at his death were some which were published in 1848
as the Court and Times of James I. and the Court and Times of
Charles I.

(1886); A. Kippis, Biographia Britannica (London, 1778-1793); Horace Walpole, Letters (London, 1891).

BIRCH (Betula), a genus of plants allied to the alder (Alnus),
and like it a member of the natural order Betulaceae. The various
species of birch are mostly trees of medium size, but several of
them are merely shrubs. They are as a rule of a very hardy
character, thriving best in northern latitudes—the trees having
round, slender branches, and serrate, deciduous leaves, with
suckers and fertile catkins on the same tree, and winged fruits,
the so-called seeds. The bark in most of the trees occurs in fine
soft membranous layers, the outer cuticle of which peels off in
thin, white, papery sheets.

The common white or silver birch (B. alba) (see fig.) grows
throughout the greater part of Europe, and also in Asia Minor,
Siberia and North America, reaching in the north to the extreme
limits of forest vegetation, and stretching southward on the
European continent as a forest tree to 54° N. lat., be-

doing which birches occur only in special situations or as iso-
lated trees. It is well known in England for its
graceful habit, the slender, grey-white—barked stem, the
delicate, drooping branches and the quivering leaves, a
bright, clear green in spring, becoming duller in the sum-
mer, but often keep-
ing their greenness rather late into the autumn. The male
and female flowers are borne on separate catkins in April and
May. It is a short-
lived tree, generally
from 40 to 50 ft.
high with a trunk seldom more than 1 ft. in diameter. It
flourishes in light soils and is one of the few trees that will grow
amongst heather; owing to the large number of "winged seeds" which are readily scattered by the wind, it spreads
rapidly, springing up where the soil is dry and covering clear-
ings or waste places.

The birch is one of the most wide-spread and generally useful
of forest trees of Russia, occurring in that empire in vast forests,
in many instances alone, and in other cases mingled with pines,
poplars and other forest trees. The wood is highly valued by
carriage-builders, upholsterers and turners, on account of its
toughness and tenacity, and in Russia it is prized as firewood
and a source of charcoal. A very extensive domestic industry
in Russia consists in the manufacture of wooden spoons, which
are made to the extent of 30,000,000 annually, mostly of birch.
Itspliant and flexible branches are made into brooms; and in
ancient Rome the fasces of the licitors, with which they cleared
the way for the magistrates, were made up of birch rods. A
similar use of birch rods has continued among pedagogues to
times so recent that the birch is yet, literally or metaphorically,
the instrument of school-room discipline. The bark of the
common birch is much more durable, and industrially of greater

value, than the wood. It is impermeable to water, and is therefore used in northern countries for roofing, for domestic utensils, for boxes and jars to contain both solid and liquid substances, and for a kind of bark shoes, of which it is estimated 25 millions of pairs are annually worn by the Russian peasantry. The jars and boxes of birch bark made by Russian peasants are often stamped with very effective patterns. By dry distillation the bark yields an empyreumatic oil, called diogott in Russia, used in the preparation of Russia leather; to this oil the peculiar pleasant odour of the leather is due. The bark itself is used in tanning; and by the Samoiedes and Kamchadaks it is ground up and eaten on account of the starchy matter it contains. A sugary sap is drawn from the trunk in the spring before the opening of the leaf-buds, and is fermented into a kind of beer and vinegar. The whole tree, but especially the bark and leaves, has a very pleasant resinous odour, and from the young leaves and buds an essential oil is distilled with water. The leaves are used as fodder in northern latitudes.

The species which belong peculiarly to America (B. lentu, excelsa, nigra, papyracea, &c.) are generally similar in appearance and properties to B. alba, and have the same range of applications. The largest and most valuable is the black birch (B. lentu) found abundantly over an extensive area in British North America, growing 60 to 70 ft. high and 2 to 3 ft. in diameter. It is a wood most extensively used for furniture and for carriage-building, being tough in texture and bearing shocks well, while much of it has a handsome grain and it is susceptible of a fine polish. The bark, which is dark brown or reddish, and very durable, is used in the same way as the bark of B. alba is used in northern Europe.

The canoe or paper birch (B. papyracea) is found as far north as 70° N. on the American continent, but it becomes rare and stunted in the Arctic circle. Professor Charles Sprague Sargent says: “It is one of the most widely distributed trees of North America. From Labrador it ranges to the southern shores of Hudson’s Bay and to those of the Great Bear Lake, and to the valley of the Yukon and the coast of Alaska, forming with the aspen, the larch, the balsam poplar, the banksian pine, the black and white spruces and the balsam fir, the great subarctic transcontinental forest; and southward it ranges through all the forest region of the Dominion of Canada and the northern states.” It is a tree of the greatest value to the inhabitants of the Mackenzie river district in British North America. Its bark is used for the construction of canoes, and for drinking-cups, dishes and baskets. From the wood, platters, axe-handles, snow-shoe frames, and dog sledges are made, and it is worked into articles of furniture which are susceptible of a good polish. The sap which flows in the spring is drawn off and boiled down to an agreeable spirit, or fermented with a birch-wine of consisting alcoholic strength. The bark is also used as the substitute for paper. A species (B. Knojtfjuttra) growing on the Himalayan Mountains, as high up as 9000 ft., yields large quantities of fine thin papery bark, extensively sent down to the plains as a substitute for wrapping paper, for covering the “snakes” of hookahs and for umbrellas. It is also said to be used as writing paper by the mountainneers; and in Kashmir it is in general use for roof ing houses.

BIRCH-PFEIFFER, CHARLOTTE (1800-1868), German actress and dramatic writer, was born at Stuttgart on the 23rd of June 1800, the daughter of an estate agent named Pfeiffer. She received education at the Munich court theatre, and in 1818 began to play leading tragic roles at various theatres. In 1825 she married the historian Christian Birch of Copenhagen, but continued to act. From 1837 to 1843 she managed the theatre at Zürich. In 1844 she accepted an engagement at the royal theatre in Berlin, to which she remained attached until her death on the 24th of August 1868. Her intimate knowledge of the technical necessities of the stage fitted her for the successful dramatization of many popular novels, and her plays, adapted and original, make twenty-three volumes, Gesammelte dramatische Werke (Leip. 1863-1868). Many still retain the public favour. Her novels and tales, Gesammelte Novellen und Erzählungen, were collected in three volumes (Leip. 1863-1865).

Her daughter, Wilhelmine von Hilleur (b. 1836), born at Munich, went on the stage, but retired upon her marriage in 1857. After 1899 she lived in Oberammergau and won a reputation as a novelist. Her most popular works are Ein Arzt der Seele (1860, 4th ed. 1868); and Die Geister-Wally (1883), which was dramatized and translated into English as The Village Maidens (Leip. 1876).

BIRD, the common English name for feathered vertebrates, members of the class Aves. The word in Old Eng. is bird and in Mid. Eng. byrd or byrd, and in early uses meant the young or nestlings only. It is partly due to this early meaning that the derivation from the root of “brood” has been usually accepted; this the New English Dictionary regards as “inadmissible.” The word does not occur in any other Teutonic language. As a generic name for the feathered vertebrates “bird” has replaced the older “fowl,” a common Teutonic word, appearing in German as Vogel. “Bird,” when it passed from its earlier meaning of “nestlings,” seems to have been applied to the smaller, and “fowl” to the larger species, a distinction which was retained by Johnson. In modern usage “fowl,” except in “wild-fowl” or “water-fowl,” is confined to domestic poultry.

The scope of the anatomical part of the following article is a general account of the structure of birds (Aves) in so far as they, as a class, differ from other vertebrates, notably reptiles and mammals, whilst features especially characteristic, peculiar or unique, have been dwelt upon at greater length so far as space permitted. References to original papers indicate further sources of information. For a comprehensive account the reader may be referred to Prof. M. Fürbringer’s enormous work Untersuchungen zur Morphologie und Systematik der Vögel, 4to., 2 vols. (1888); H. G. Bronn’s Klassen und Ordnungen des Thierreichs, vol. vi., “Aves,” Leipzig, completed 1893 by Gadow; and A. Newton’s Dictionary of Birds, London, 1896.

For the history of the classification of birds see the article ORNITHOLOGY, where also the more important ornithological works are mentioned. Egg, Feathers (including Moulting), Nest, &c., also form separate articles to which reference should be made. In this article (a) the general anatomy of birds is discussed, (b) fossil birds, (c) the geographical distribution of birds, (d) the latest classification of birds.

A. Anatomy of Birds

1. Skeleton.

Skull.—When W. K. Parker wrote the account of the skull in the article BIRDS for the 9th edition of the Encyclopedia Britannica, he had still to wrestle with the general problem of the composition and evolution of the skull. That chapter of comparative anatomy (together with other anatomical details, for which see the separate articles) is now dealt with in the article SKULL; here only the most avin features are alluded to, and since some of Parker’s original illustrations have been retained, the description has been shortened considerably.

One general feature of the adult bird’s skull is the almost complete disappearance of the sutures between the bones of the cranial proper, whilst another is the great movability of the whole palatal and other suspensorial apparatus. The occipital condyle (fig. 1) is a single knob, being formed almost wholly by the basi-occipital, while the lateral occipital bone is merely a tubercle (occipitalis) to take but little share in it. Part of the membranous roof between the supra-occipital and parietal bones frequently remains ossified and presents in the mitered skull a pair of fontanelles. The squamosals form the posterior border margin of the orbit and are frequently continued into two lateral downward processes across the temporal fossa. One of these, the processus orbitaris posterior, often combines with an outgrowth of the alisphenoid, and may be, e.g., in cockatoos, continued forwards to the lacrymal bone, so as to form a complete infraorbital bridge. The posterior, so-called processus zygomaticus is very variable; in many Galli it encloses a foramen which is posteriorly joining the orbital process. The rhinion frequently appears on the dorsal surface between the frontals. There are three periodic bones (pro-epi-, episth-oite). The prootic encloses between it and the lateral occipital the fenestra ovalis, into which fits the columna of the ear. The epiotic is often small, ossifies irregularly,
and fuses with the supra-occipital. The opisthotic lies between the epiotic and the lateral occipital with which it ultimately fuses; in some birds, e.g. in Larus, it extends far enough to help to bound the foramen magnum. The basi-sphenoids are ventrally overlaid, and

**Fig. 1.**—End view of skull of a Chicken three weeks old, X 8 diameters. Here the opisthotic bone appears in the occipital region, as in the adult Chelonia. (After W. K. Parker.)

Later on fused with, a pair of membrane bones, the basi-temporals, homologous in part with the parasphenoid of lower vertebrates. They contribute to the formation of the auditory meatus, and of the right and left carotid canals which accompany the eustachian tubes.

In many birds the basi-sphenoids send out a pair of basipterygoid processes by which they articulate with the pterygoids. Dorsolaterally the basi-sphenoid is joined by the alisphenoid which forms most of the posterior wall of the orbit. The orbito-sphenoids diverge only posteriorly, otherwise they are practically unpaired and form the median interorbital septum, which is very large in correlation with the extraordinary size of the eyeballs.

Prefrontal bones are absent; post-frontals are possibly indicated by a frequently occurring separate ossification in the postorbital process, to which bones may contribute. The lacrimal is always present, and perforated by a glandular duct. Attached to it or the neighbouring frontal is often a supraorbital; infraorbitals occur also, attached to the jugal or downward process of the lacrimal. The nasals were used by A. H. Carrol to distinguish the birds as holarhinal (fig. 2) where the anterior margin of the nasal is concave, and schizorhinal where this posterior border of the outer nares is continued backwards into a slit which extends beyond the frontal processes of the premaxilla. Many birds possess a more or less well developed cross-joint in front of the frontals and lacrymals, perhaps best developed in Anseres and Psittaci. Owing to this joint the whole upper beak can be moved up and down with extra facility, according to the shoving forwards or backwards of the palato-pterygo-quadrate apparatus which moves the beak—like upon the cranial basis. The premaxilla is always unpaired, but each half has three long processes directed backwards; one fuses with the maxillary bone, another helps to form the anterior part of the palate, while the third, together with its fellow, forms the "culmen" and extends backwards to the frontals, or rather to the ethmoid which there crops up on the surface. The maxillaries (fig. 3) have besides others, a maxillo-palatine process directed forwards in a transverse horizontal direction. The palatines are long, always fused anteriorly with the premaxilla, and frequently with the maxillo-palatine processes; posteriorly they slide upon the presphenoidal rostrum, and articulate in most birds with the pterygoids; they form the greater part of the palatal roof and aid the choanae or inner nares. Between these, resting vertically upon the rostrum, appears the vomer; very variable in shape and size, often reduced to a mere trace, as in the Galli, or even absent, broken up into a pair of tiny splits in Pici.

The taxonomic importance of the configurations of the palate was first pointed out by J. de Cornay. T. H. Huxley, in 1866, divided the carinate birds into Dromaeo-, Schizo-, Desmo-, and Aegithopithecus, an arrangement which for many years had a considerable influence upon classification. However, subsequent anatdental deductions have detracted much from its value, especially when it became understood that the above sub-orders are by no means natural groups. Dromaeognathae have a struthious palate, with a broad vomer meeting in front the broad maxillo-palatal plates, while behind it reaches the pterygoids. The only representatives are the Tinamous. Schizognathae, e.g. fowls (fig. 4), pigeons, gulls, plowers, rails and penguins, have the vomer pointed in front while the maxillo-palatines are free, leaving a fissure between the vomer and themselves. The schizognathous formation is doublet the most primitive, and its representatives for a tolerably natural

assembly. **Desmognathae** (fig. 5) were supposed to have the maxillo-palatines united across the middle line, either directly or by the inter-temporal. The same was the case with all the birds. The skull is unusually schizognathous, the vomer being very small, and the maxillo-palatine process (mp) much aborted.

**Fig. 4.—**Skull of adult Fowl. This skull is unusually schizognathous, the vomer being very small, and the maxillo-palatine process (mp) much aborted.

**Fig. 5.—**Skull of nestling Sparrow-hawk (**Accipiter nissus**), palatal view, X 2 diameters. The circular space on each side of the basi-temporal (btg) is the opening of the anterior tympanic recess. The basi-pterygoids (bpg) are mere knobs, and the common eustachian opening is seen between them. The maxillo-palatine plates (mp) are dotted to show their spongy character.

**Fig. 6.—**Skull of adult Fowl. Here the temporal fossa is bridged over by the junction of the post-frontal and squamosal processes (pf, sq.). The processes of the mandible (iap, pap) are characteristic of this type, and of the anseres.

The **Ilyoid apparatus** is, in its detail, subject to many variations in accord with the very diverse uses to which the tongue of birds is
In birds we distinguish between the following regions of the axial skeleton. (1) Cervical vertebrae, or those between the skull and the first vertebra which is connected with the sternum by a pair of complete ribs. The last 1 to 5 of these vertebrae have movable ribs attached to it; in others they are not mobile, and are called cervico-dorsals. (2) Dorsals, those which begin with the first thoracic rib, and end at the last that is not fused with the ilium. The term "lumbar" vertebrae is inapplicable to birds. (3) Pelvic, all those which are connected with the pelvis, generally a considerable number. (4) Caudal, those which are not connected with the pelvis. It is to be noted that often no absolute line of demarcation can be set up. With regard to these regions, their definitions being rather convenient than morphological.

In comparison with all other vertebrates the number of neck-vertebrae of the birds is considerably increased; the lowest number, 14 to 15, is that of most Passeres and many other Coraciiformes; the largest numbers, 20 or 21, are found in the ostrich, 23 in Cygnus and 25 in the black swan. Dorsal vertebrae frequently have a ventral outgrowth of the centrum; these hypapophyses may be simple vertical blades, elongated, or barbed; they serve for the attachment of the thoracic origin of the longus colli muscle, reaching their greatest development in Hesperornis, and in the hyoid branches of the first and second birds some of the thoracic vertebrae are more or less ossified, in most pigeons for instance the ninth to the twelfth. Gall the last cervical and the next three or four thoracics are coalesced, &c. The pelvic vertebrae include of course the sacrum. This consists of three vertebrae which are equivalent to those of the reptiles; these true sacras are situated in a level just behind the acetabulum; as before the two primary sacral vertebrae the last of the spinal nerves which contribute to the composition of the sciatic plexus. These true sacras alone are connected with the ilium by processes which are really equivalent to those of the pelvic girdle, or of the pelvis, and thus become pre- and post-sacral vertebrae.

Get and backward, gradually coming into contact with other vertebræ, which in various ways send out a pair of ribs; the first pair, the seventh, or (the) anterior is called the iliolumbar, or (in) the caudal vertebrae. The last six or seven caudal vertebrae coalesce into the pygostyle, an upright bone which carries the rectrices. Such a pygostyle is absent in Archaeopteryx, Hesperornis, Tenuirostrum and Rallitae, but it occurs individually in old specimens of the ostrich and the kiwi. In Ichthyornis it is very small. In all the Neornithes the total number of caudal vertebrae, inclusive of those which coalesce, is reduced to at least 13. Sternum (figs. 10 and 11).—Characteristic features of the sternum are the following. There is the proccesus lateralis anterior (the right and left pair of cartilage bones which form the product of two or three ribs, the dorsal portion of which remain ribs and are called cervico-dorsals. Then follows the rib-containing synsacrum, and then the processus lateralis posterior; this is also the product of ribs, consequently the right and left processes are merely the siphon or siphon process or sphenosternum. The last process is quite a different one from the one of the mammals. The lateral process in most birds sends out an outgrowth, directed outwards and upwards, overlapping some of the ribs, the processus obliquus. The median and posterior extension of the body of the sternum is a direct outgrowth of the latter, therefore
called meta-sternum. The anterior margin of the sternum, between the right and left anterior lateral processes receives in sockets the feet of the coracoids. Between them arises a median crest, which varies much in extent and consists in its most considerable taxonomic value. It is represented either by a *spina interna* or by a *spina externa*, or by both, or they join to form a *spina communis* which is often very large and some times ends in a bifurcation. Eventually, when the right and left feet of the coracoids overlap each other, the anterior sternal spine carna lizes to form the sternum. The keel, or *carina sterni*, is formed as a direct cartilaginous outgrowth of the body of the sternum, ossifying from a central special centre. This keel is much reduced in the New Zealand and parrot, *Strigops*, less in various flightless rails, in the dodo and solitaire.

It is absent in the Ratitae, which from this feature have received their name, but considerable traces of a cartilaginous keel occur in the embryo of the ostrich, in showing undeniably that the absence of a keel in the recent bird is not a primitive, fundamental feature. The keel has been lost, and is being lost, at various epochs and by various groups of birds. The swimming *Hesperornits* (see Oontornithinae) was also devoid of such a structure. In many birds the spaces between the metasternum and the posterior processes and again the spaces between this and the oblique process are filled up by proceeding ossification and either remain as notches, or as fenes, or they are completely abolished so that the breastbone is turned into one solid more or less oblong plate.

Shouder Girdle.—Scapula, coracid and clavicle, meet to form the foramen trionseum, through which passes the tendon of the supracoracoideus, or subclavus muscle to the tuberculum suprærurs of the humerus. The coracoide is one of the most characteristic bones of the bird's skeleton. Its upper end forms the arcocoracoideus, which is the inner face of which we observe the proximal portion of the clavicle. From the inner side of the neck of the coracoid arises the precoracoideal process, the remnant of the coracoid. Only in the other aves is this element mostly complete, although soon fused at either end with the coracoideus. Near the base of the pre-coracoideal process is a small foramen for the passage of the *nerveus supracoracoideus*. In most birds the feet of the coracoids do not touch each other; in others they meet, in others one overlaps the other, the right lying ventrally upon the left. The scapula is sabre-shaped, and extends backwards over the ribs, lying almost parallel to the vertebral column. This is a peculiar character of all birds. The clavicles, when united, as usual, form the furcula; mostly the distal median portion is drawn out into a hypocalendylia of various shape. Often it reaches the keel of the sternum, with subsequent synostosis or even synostesis, *e.g.*, in the gannet. In birds of various groups the clavicles are more or less degenerated, the reduction beginning at the distal end. This condition occurs in the Ratitae as well as in the well-flying *Platycercinae* amongst parrots.

The fore-limb or wing (fig. 12); highly specialized for flight, which, initiated and made possible mainly by the strong development of quill-feathers, has turned the wing into a unique organ. The humerus with its crests, ridges and processes, presents so many modifications characteristic of the various groups of birds, that its configuration alone is not of considerable taxonomic value but that almost any genus, excepting, of course, those of the Order *Struthionidae* is "spotted" by a close examination and comparison of this bone. When the wing is folded the long glenoid surface of the head of the humerus is bordered above by the *tuberculum externum* or *suprærurs*, in the middle and below by the *tuberculum medium* or *inferius* for the insertion of the *coraco-brachialis posterior* muscle. From the outer tuberculum extends the large crist* inferior* (insertion of *pectoralis major* and of *deltoides major* muscles). The ventral portion of the neck is formed by the strong *crista inferior*, on the middle of which is the deep fossa *subtrochanterica* by which air sacs enter the humerus. On the outer side of the humerus between the head and the *crista inferior* is a groove lodging one of the coracohumeral ligaments. The distal end of the humerus ends in a trochlea, with ends, leaving as a rule a space between the shafts. The pollex and the third finger are as a rule reduced to one phalanx each, while the index still has two. The first and second fingers frequently carry a little claw. The greatest reduction of the hand-skeleton is met with in *Dromaeus* and in *Aptericyx*, which retain only the index finger. It is of importance for our understanding of the position of the Ratitae in the system, that the wing-skeleton of the ostrich and rhea is an exact repetition of that of typical flying birds; the bones are much more slender, and the muscles are considerably reduced in strength also to a lesser extent in numbers, but the total length of the wing of an ostrich or a rhea is actually and comparatively enormous. Starting with the first and casuarine, people have got into the habit of confounding flightless with wingless conditions. It is absolutely certain that the wings of the Ratitae bear the strongest testimony that they are the descendants of typical flying birds.
The pelvis (fig. 13), consisting of the sacrum (already described) and the pelvic arch, namely ilium, ischium and pubis, it follows that only birds and mammals possess a pelvis proper, whilst such is entirely absent in the Amphibia and in reptiles with the exception of some of the Dinosauria. The ventral inner margin of the preacetabular portion of the ilium is attached to the pre-sacral vertebrae, while the inner and dorsal margin of the postacetabular portion is attached to the primary sacral and the post-sacral vertebrae. In rare cases the right and left postacetabular blades fuse with each other above the spinous processes. In front of the acetabulum a thick process of the ilium descends to meet the pubis, and a similar process behind meets the ischium. The acetabulum is completely surrounded by these three bones, but its cup always retains an open foramen; from its posterior rim arises the strong antitrochanter. The ischium and postacetabular ilium originally enclose the ischiadic notch or inceursa ischiadica. This primitive condition occurs only in the Odontornithes (qu.), Ratitae and Tinamí; in all others this notch becomes converted into a foramen ischiadicum, through which pass the two stems of the ischiadic nerves and most of the blood-vessels of the hind-limb. The pubis consists of a short anterior portion (spina pubica or pectoral process, homologous with the prepubic process of Dinosaurs) and the long and slender pubis proper (equivalent to the processus pubis lateralis of most reptiles). The shaft of the pubis runs parallel with that of the ischium, with which it is connected by a short ligamentous or bony bridge; this cuts off from the long inceursa pubo-ischiadica a proximal portion, the foramen obturatum, for the passage of the obturator nerve. Only in the ostrich the distal ends of the pubis meet, forming a dagger-shaped symphysis, which is curved forwards. The pectoral process of the so-called hypotarsus, which in various ways, characteristic of the differrent groups of birds (with one or more sulci, grooved or perforated), acts as guiding pulley to the tendons of the flexor muscles of the toes. Normally the four metatarsals present five phalanges respectively, but in Cypselus the number is reduced to three in the front toes. Reduction of the number of toes (the fifth shows no tracks whatever, not even in Acanthocyclus) begins with the hallux, which is completely or partly absent in many birds; the second toe is absent in Struthio only. The short feet of the penguins are quite plantigrade, in adaptation to which habit the metatarsals lie in one plane and are incompletely ossified, thus presenting a pseudo-primitive condition.

**LITERATURE.**—Only a mere fraction of the enormous literature dealing with the skeleton of birds can here be mentioned.

Of the muscles of the stem or axis, those of the neck and tail are well-developed and specialized, while those of the lower back are more or less reduced, or even completely degenerated owing to the rigidity of this region, brought about by the great antero-posterior extent of the pelvis.

The muscles of the limbs show a great amount of specialization, away from the fundamental reptilian and mammalian conditions. The muscles of the fore limbs are most aberrant, but at the same time most uniformly developed than those of the hinder extremities. The mechanisms of the whole wing is a unique modification, deeply affecting the skeletal, muscular and tegumentary structures, but fluttering, skimming, sailing, soaring are motions much more akin to one another than climbing and grasping, running, scratching, paddling and wading. The modifications of the hind-limbs are in fact many times greater (such as extremely long legs, with four, three or only two toes; very short legs, almost incapable of walking, with all four toes directed forwards, or two or one backwards, and two or more connected and therefore bound to act together, in various
ways. Thus it has come to pass that the muscles of the hind limbs are, like their framework, more easily compared with those of reptiles and mammals than are the wings, whilst within the class of birds they show an enormous amount of variation in direct correlation with their manifold requirements. The only really aberrant modifications of the wing-muscles are found in the Raitiae, where they are, however, all easily explained by reduction, and in the penguins, where the wings are greatly specialized into blades for rowing with screw-like motions.

The wing of the bird is folded in a unique way, namely, the radius parallel with the humerus, and the whole wrist and hand with their ulnar side against the ulna; upper and forearm in a state of supination, the hand in that of strong abduction. Dorsal and ventral bending, even in the doubled wing, is almost impossible. Consequently only a few of the original extensor muscles have been preserved, but these are much modified into very independent organs, notably the extensor metacarpi radii longus, the ext. meta. ulnaris and the extensor ulnaris-ulnaris-metacarpi muscles, in reality homologous with the mammalian supraspinatus muscle. This arises mostly from the angle formed by the keel with the body of the sternum, passes by a strong tendon through the foramen triossum, and attaches to the upper surface of the humerus, which it depresses and slightly rotates forwards during the down-stroke. This great muscle covers completely the supracoracoideus, generalis coracoideo-semitendinosus and the deltoideus muscle, as indicated by an exclamation mark. It is inserted upon the greater tubercle of the humerus. The extensor metacarpi radii longus, arising, when developed, on the ventral side, of the humerus, and having been connected with the sternum, later is inserted into the greater tubercle as it is in the mammalian arm. It is interesting, as a morphological point of view (showing the subtle and gradual modifications of these organs in their various adaptations), that they are sparse in taxonomic value, for less satisfactory than those of the hind-limbs. Of course, however, the bird retains some remnants of the retrograde descendants of flying ancestors, that the various groups of surviving Raitiae are, as such, a polyphyletic group, and that it has been thrust back into the human type as it has in the usual course of modifiable anatomical changes. The loss of flight power is associated with modification of the wing-muscles in the manner of the dromaeosauridae, but these, so-called, costal muscles, as it has been termed, the ambiens muscle, long and spool-shapied, lying immediately beneath the skin, extending from the pectoral process or the clavicle towards the ulnar tubercle of the humerus, where it rotates and abducts. The extent of the origin of this muscle from the sterno-clavicle, on which it leaves converging, parallel or diverging impressions, is of some taxonomic value.

From Newton's Dictionary of Birds, by permission of A. & C. Black.

**ANATOMY**

**BIRD**

The **flexor digitorum sublimis** muscle arises fleshy from the long elastic band which extends from the inner humeral condyle along the ventral surface of the ulna to the ulnar carpal bone, over which it runs to insert into the radius. The radius is, as indicated in the figure, the first phalanx of the second digit. Owing to the elasticity of the humeral-condylar band the wing remains closed without any special muscular contractions. The same is true, when the arm is extended, this band assists in keeping it taut. The arm-muscles have been described in an exhaustive manner by Fürbringer, who in his monumental work has tabulated and then scrutinized the chief characters of fourteen select groups. This is done here, as it is the aim to bring out, a taxonomic point of view (showing the subtle and gradual modifications of these organs in their various adaptations), that they are sparse in taxonomic value, for less satisfactory than those of the hind-limbs. Of course, however, the bird retains some remnants of the retrograde descendants of flying ancestors, that the various groups of surviving Raitiae are, as such, a polyphyletic group, and that it has been thrust back into the human type as it has in the usual course of modifiable anatomical changes. The loss of flight power is associated with modification of the wing-muscles in the manner of the dromaeosauridae, but these, so-called, costal muscles, as it has been termed, the ambiens muscle, long and spool-shapied, lying immediately beneath the skin, extending from the pectoral process or the clavicle towards the ulnar tubercle of the humerus, where it rotates and abducts. The extent of the origin of this muscle from the sterno-clavicle, on which it leaves converging, parallel or diverging impressions, is of some taxonomic value.

The **propatagialis longus** muscle is composed of slips from the deltoid, pectoral, biceps and **cucullaris** muscles. Its strong belly originates near the shoulder joint from clavicle, coracoid and scapula. Its elastic tendon runs directly to the carpus, forming thereby the outer margin of the anterior patagium, or fold of skin between the upper and forearm, which it serves to extend, together with the **propatagialis brevis** muscle. This runs down the anterior and outer side of the upper arm, and is attached to the proximal tendon of the extensor metacarpi radii longus, a little below the outer condyle of the humerus. In most birds the tendon is split into several portions, one of which is often attached to the outer side of the ulna, below the elbow joint, while others are in variable but characteristic ways connected with similar slips of the **propatagialis longus**. The posterior patagium, the fold between trunk and inner surface of the upper arm, is stretched by the **metapatagialis** muscle, which is composed of slips from the serratus, superficiales, latissimus dorsi and the expensor secundarium muscles. This, the stretcher of the cubital quills, is a very interesting muscle. Arising as a long tendon from the sterno-scapular ligament, it passes the axilla by means of a fibrous pulley, accompanies the axillary vessels and nerves along the humerus, and is inserted by a few fleshy fibres on the base of the last two or three cubital quills. Here, alone, at either side of the carinate fibres, the other fibres are unstriped, belonging to the category of cutaneous muscles. We have here the interesting fact that a muscle (portion of the **triceps humeri** of the reptiles) has been reduced to a tendon, which in a secondary way has become connected with cutaneous muscles, which, when strongly developed, represent its belly.
failure. Its author, with a considerable mathematical and mechanical bias, reckoned entirely with the quantity, not with the quality of his units, and relied almost implicitly upon his formulae. It is, however, fair to state that his system was not built entirely upon these particular variations, but rather upon a more laborious combination of anatomical characters, which were so selected that they presumably could not stand in direct correlation with each other, notably the oil-gland, carotids, nasal bones and all the muscles of the thigh. He was, indeed, the first to show clearly the relationship of the heron-like birds with the Steganopodes; of stork-like birds with the American Vorel; of the great difference between the latter and the other birds of prey; the connection of the gulls and auks with the plovers, and that of the sand-grouse with the

The pigeon—discoveries expressed in the new terms of the orders Ciconiiformes and Charadriiformes. These are instances, now well understood, that almost every organic system, even when studied by itself, may yield valuable indications as to the natural affinities of the various groups of birds. That Garrod has so very much advanced the classification of birds is ultimately due to his comprehensive anatomical knowledge and general insight.

To return to these thigh muscles. The most primitive combination, ambians and A B X Y, is the common next; followed immediately by that of A X Y, meaning the reduction of B, i.e. the iliac portion of the caud-ilio-femoralis; A B X and B X Y are less common; A X and Y are rare and occur only in smaller groups, as in the families of genera; B X occurs only in Pitys. But the greatest reduction, with only A remaining, is characteristic of such a heterogenous assembly as Accipitres, Cypselidae, Trochilidae, Strigies and Fregate. This fact alone is sufficient proof that these conditions, or rather reductions, have been acquired in the various groups. A B Y, A Y, A B X Y and B do not occur at all, none of them for obvious reasons. Occasionally there is an instructive progressive evolution expressed in these formulae; for instance Phaethon, in various other respects the lowest of the Steganopodes, has A X Y, Sula and Phalarocorax have A X, Fregata, the most specialized of these birds, has arrived at the reduced formula A. Further, the combinations B X Y and A X Y can only be derived from each other, but both directly from A B X Y in two different directions. Keeping this in mind, we may fairly conclude that the flamingo with B X Y points to an ancestral condition A B X Y, which is still represented by Pelican and Ibis, whilst the other stocks proper have taken a different line, leading to A X Y.

**Brain.**—The more characteristic features of the bird's brain show clearly a further development of the reptilian type, not always terminal features in a direct line, but rather side-departures, sometimes even a secondary sinking to a lower level, and in almost every case in a direction away from those fundamentally reptilian lines which have led to the characters typical of, and peculiar to, the mammals.

The forebrain forms the bulk of the whole brain, but the large size of the hemispheres is due to the greater development of the basal and lateral portions (pedunculi cerebris et corpora striata), while the parietal and occipital portion external to the latter is relatively small and restricted to the median side of each hemisphere. As a direct result of this undoubtedly secondary reduction of the pallium—due to the expansion of the surrounding basal plexus and the blood-vessels of the floor of the skull, the caudal portion of the forebrain (the transverse commissure of the right and left pallium) in birds is reduced to a narrow flat bundle of a few white fibres; it is situated immediately above and behind the much stronger anterior commissure, i.e. the union of the two lateral parts of the middle part of each hemisphere. Owing to the small size of the olfactory lobes the anterior arms of the latter commissure are wanting. There is very little grey matter in the cortex of the hemispheres, the surface of which is almost exclusively covered with a network of white fibres, mostly smooth, in others, for instance pigeons, fowls and birds of prey, a very slight furrow might be compared with the Sylvian fissure.

The laminae of the outer brain, or the white matter, is deuterencephalic, or pineal body, is quite as degenerate as in mammals, although still forming a long stalk as in reptiles. In birds, this stalk consists entirely of blood-vessels, which in the adult enclose no terminal vessel, and fuse with the membranous linings of the skull. The midbrain is represented chiefly by the optic lobes, the cortex of which alone is homologous with the corpora quadragemina of the mammals. Their transverse dorso-lateral connexions is the posterior commissure; otherwise the whole roof portion of the midbrain is reduced to a thin membrane, continuous with that which covers the Sylvian aqueduct, and this ventricle sends a lateral cavity into each optic lobe, as is the case in reptiles. The right and left lobes themselves are separated by a strong transverse line, the optic lobes; backwards it hides the much shortened medulla oblongata.

Several futile attempts have been made to draw conclusions as to the intelligence of various birds, from comparison of the size of the whole brain with that of the body, or the weight of the hemispheres with that of other parts of the central nervous system. The *brachial plexus* is formed by four or five of the lowest cervical nerves; the last of these nerves often marks the boundary of the cervical and thoracic vertebrae. The composition of the plexus varies much, not only in different species, but even individually. The most frequent is a brachial plexus of five or six nerves, which leaves the pelvis as one thick system through the ilio-ischiadic foramen. The last nerve which contributes to the ischiadic plexus leaves the spinal column in most birds either between the two primary sacral nerves, or just behind, and sends its branch to the public portion which is composed of post-ischiadic nerves, partly imbedded in the kidneys, and innervates the ventral muscles between the tail and pubis, together with those of the cloaca and copulatory organs.
Anatomy

The Sympathetic System forms a chain on either side of the vertebral column. In the region of the neck lateral strands pass through the transverse canal of the cervical vertebrae; but from the lower neck region on, the strands separate, where the cervical trunk gives off, each strand is double and the basilar ganglia are successively connected with the next by a branch which runs ventrally over the capsule of the ear, the auditory tube, and its naurcleus, directed towards the optic nerve, a pulley for the long tendon of the pyramidalis muscle. This arises from the nasal surface of the ball, and its tendon passes into the somewhat imperfectly transparent nictitating membrane. The calcar nictitantis lateralis, prevents evaporation and prevents pressure upon the optic nerve; during the state of relaxation of both muscles the nictitans withdraws through its own elasticity.

See R. Leuekert in Graefe and Saemisch's Uebersicht d. Ophthalmo-

Ear.—The outer opening of the ear is, with rare exceptions, covered by feathers which are often rather stiff, or modified into bristles. There is no other protection, but slight, imperfectly movable lips of skin arise from the outer rim. The largest ear-opening is met with in the owls, with correspondingly larger folds of skin, the function of which is less that of protection than, probably, the catching of sound. In many owls the right and left ears are asymmetrical, and this asymmetry affects the whole of the temporal region, all the bones which surround the outer and middle ear, notably the squamosal and the quadrate, so that the skull becomes lopsided, one ear being turned obliquely downward, the other upward. For details see Collett, Christiania Vidensk. Forh., 1883, No. 3.

The middle ear communicates with the mouth by the Eustachian tubes, which pass between the basihypophysial and basiocipital bones, and unite upon the ventral side of the sphenoid, a little behind its articulation with the pterygoids, where they open into the middle ear cavity by a short membranous duct. The columnar apparatus, or auditory cavity of ossicles (fig. 16), extending between the fenestra vestibuli and tubae audientes, the first of which moves from the drum, consists of (1) the long and slender columnella, a straight, ossified rod which fits with a disk into the fenestra cochleae; it is homologous with the stapes (m. st.), although not stirrup-shaped; (2) the extra-columnar mass. This is chiefly cartilaginous and sends out three processes: the dorsal (i. st.) is attached to the upper wall of the drum cavity; the outermost (e. st.) is attached to the margin of the tympanic membrane; the third, ventral or infracolumellar process (i. st.) is directed downwards and tapers out into a thin, flat, cartilaginous lamina which is originally extended to the inner corner of the articular portion of the malleus, but on its long way comes to be enclosed by the tympanic membrane, and the junction between the malleus and the pterygoid and quadratus. This long downward process being homologous with an almost exactly identical arrangement in the crocodile, and with the 'chain' of Chieken, X. & processes folii of the mammalian flowers; lateral and basal malleus, it follows that the whole views. (After W. K. Parker.)

extraomular mass, that between stapes and drum, is equivalent to incus and malleus of the mammal. There is, in birds, no annulus tympanicus. Birds possess an ear-muscle which at least acts as a tensor tympani; it arises near the drum cavity, passes through a hole into the tympanic cavity, and its tendon, is in various ways, attached to the inside of the membrane and the neighbouring extracolumellar processes. As regards the inner ear, the endolympathic duct ends in a closed sacculus, imbedded in the dura mater of the cranial cavity. The apex of the cochlea is turned towards, and almost reaches the anterior wall of the occipital condyle; at most it makes but half a twist or is entirely wanting. It is ossificated by the basihypophysial bone of Corti. Although the scala tympani is so rudimentary, not reaching a higher level than in most of the reptiles, and remaining far below the mammalia, birds do not only hear extremely well, but they discriminate between voices, noises and melodies.

Note.—The olfactory organ is poorly developed, and it is still a question whether birds possess much power of smell; many are certainly devoid of it.

The olfactory perceptive membrane is restricted to the posterior innermost region of the nasal chamber, where it covers a slight bulging-out prominence on the nasal wall. This so-called third, upper or posterior conch is not a true conch, nor is that of the vestigial middle one (which corresponds to the tympanic cavity) to the only one of reptiles and the lower of the mammals. The nasal cavity communicates with the mouth by the choanae or posterior nares, situated between the palatine process of the maxillary and the vomer, the whole being restricted to the olfactory region with its unusually wide choanae. The nasal septum is often more or less incomplete, producing naves pericae, e.g. in the Calthatae, in the Anseres, gulls, rails and various other aquatic birds. The secretions of the mucous membrane of the nasal cavity, and a pair of naso-lacrimal glands (not to be confounded with the Harderian and the lacrymal glands), impregnates the whole chamber. The glands are variable in size and position; when very large, e.g. in plovers, they extend upon the forehead, causing deep impressions on the bones of the skull. Jacobson's organ has been lost by the birds, apparently without a trace. It is represented in owls but T. G. Parker has described vestiges of the corresponding cartilages in the Apteryx (Phil. Trans., 1890).

5. Vascular System.

The heart lies in the middle line of the body, its long axis being parallel with that of the trunk. The whole ventral surface of the pericardium is exposed when the sternum is removed. The right and left halves are completely divided by septa, no mixture of the venous and arterial blood being possible, an advance upon reptilian conditions, even the highest.

The aorta are comparatively small, the walls being thin, especially those of the right, which possesses numerous muscular ridges projecting into the cavity presenting a honeycombed appearance. The intervascular septum is mostly entirely membranous; in the middle it is thinner, rather transparent, but there is no depression or fossa ovalis. The whole sinus venosus has become part of the right atrium. It receives the three great venous trunks of the body, namely the vena cavae superior and inferior, the vena cava superior sinistra more deeply and position; the opening of the great ducts is guarded by two prominent valves in place of the mammalian valvea Eustachii.

The right ventricle occupies the venous heart. The aorta is guarded by a rubra carothica ductus, which in function only represents the mammalian tricuspidus; it consists of an oblique contraction of the muscular-outlet fibres together with the endocardial lining of the right ventricle, while the posterior wall is convex and forms neither a venum nor papillary muscles, nor chordae tendinea.

The right anterior corner of the right ventricle passes into the right semi-ventricle, which further develops into the right auricle, two pulmonary arteries. There are likewise two pulmonary veins, entering the left atrium by one orifice. Two or three membranous flaps, named chordae tendinea, form a true mitral valve, and all the blood to pass through the left atrium aortaventriculare.

The blood leaves the heart past three semi-venular valves, by the right aorta, this being alone functional, a feature characteristic of, and conferring on the craniates of the Gasterostomia the shape of a ligamentous strand. The aortic trunk is very short, sends off the coronary arteries and then the left aorta brachiocephalica, where the rest divides into the right brachiocephalic and the left common carotis. Each branch becomes a bronchial or pulmonal, which divides in the Brazilian hornbill and the bird in the shape of the bronchial, while in the normal or more usual cases the rest proceeds as the arterio trunk, inclusive of the vertebral artery. But the carotids show several interesting modifications which have been examined by the late Dr. W. N. Cresson, and Dr. L. Nitzsch in the former whilst the right and left carotids converge towards the middle and extend up the neck, in a funnel along the ventral surface of the cervical spine, the former in the bird the caval trunk is fuses into one carotis composita, imbued in a special median osseous semicanal of the vertebrae; e.g. herons, flamingos, and some parrots. (3) There is one carotis composita, but the basilic portion of its original right component is obliterated, leaving a so-called c. primaria sinistra, an unfortunate name. Such Aves laeo-

Venous System.—The bird's liver receives nearly all the blood from the stomach, gut, pancreas and spleen, as well as from the liver itself, into the right hepatic lobe, by a right and left portal vein. Both streams are accompanied by a hepatic duct and form the porta hepatis, in the middle line and thereby form with it the vena cava inferior. The left hepatic ducts, besides the umbilical vein, which persists on the visceral surface of the abdominal wall, often anastomosing with the epigastric veins. A careful examination of the specimens required would have probably shown that there is no portal system, excepting unimportant vestiges of such a system in the head kidneys.

Lymphatic System.—The white blood-corpuscles are produced in the lymphatic glands, that is to say, that the lymphatics of the intestinal villi. The lymphatics of the tail and hinder parts of the body enter the hypogastric veins; and at the point of junction, on either side, lies a small lymph heart, which is a structure, that is to say, that the lymphatic system is invariably oval disks, with a central nucleus which causes a slight swelling; hence they are oval and biconvex.

6. Respiratory System.

The lungs are small and occupy only the dorsal portion of the thoracic cavity. There is only one right and one left lobe, each traversed through its whole length by a mesobronchium, whence arise about ten secondary bronchia; these send off radially arranged parachronia, which end blindly near the surface. The walls of these tertiary tubes send out, in all directions, canalici acriferi which, ending in slight swellings, recall the mammalian alveoli.

Highly specialized air-sacs are characteristic of all birds. They are very thin-walled membranes, very poor in blood-vessels, formed by the bulged-out pleural or peritoneal covering of the lungs, through the parabronchial tubes of which they are filled with air. Their function is not quite clear. The usual suggestion that the warm air contained within them assist the bird in flight, balloon-like, is absurd. They assist in the extremely rapid and vigorous ventilation of the lungs, the latter being capable of but very limited expansion and contraction in birds. Exchange of gas through the walls of the air-sacs, almost devoid of blood-vessels, can at best be much restricted.

There are five pairs of larger sacs belonging to the pulmonary system: the primary, or primary sac, or primary funnel tract, reaching far up the neck, even into the cranial cavities; the throat-bags of the prairie fowls (Capitellina and Pediceac) are a further development: (i) and (2) anterior and posterior posterior thoracic or intermediate; (3) and (4) fourth posterior thoracic.; (5) the air-sacs of the air-sacs are further developed through narrow apertures—foramina pneumatica—into the hollow bones, sometimes, e.g. in hornbills and screamers, into every part of the bones, and even on the surface, or even beneath the skin. There is also a nasa-pharyngeal or tympanic system of air-sacs, restricted to the head (cf. the siphonous described in connexion with the mandible), but filling also such enormous organs as the frontal excrecence of Chaimorphyncha, the Brazilian bell-bird, the throat-bag of the adjutant stork, and the gular pouch of the bustard.

The trachea or windpipe is strengthened by numerous cartilaginous, often osseous, complete rings, but in the emu several of these rings are incomplete in the mediocentral line, and permit the inner lining of the trachea to bulge out into a large neck-pouch, which is used by both sexes as a loud speaking bag. In humming-birds and nectar-feeding birds the trachea is partly divided by a vertical, longitudinal, cartilaginous septum. In some of those birds which have a peculiarly harsh or trumpetting voice, the trachea is lengthened, forming loops which lie subcutaneously (capacitively, curassow), and it enters and dilates the symphyses of the furcula (crested guineafowl); or, e.g. in the cranes and in the hooper swan, even the whole crest of the sternum becomes involved by the trachea. In the rails and cranes the trachea is partly divided by a vertical, longitudinal, cartilaginous septum. The syrinx or lower larynx is the most interesting and absolutely aine modification, although absent as a voice-producing organ (probably due to retrogression) in most Raticae, storks, turkey and domestic fowls. The larynx is developed from the lower part of the trachea and of the adjoining bronchi. Essential are vibrating membranes between the cartilaginous framework, and next, special muscles for regulating the tension. The sound of birds possesses a pair of internal tympaniform membranes forming the inner or median walls of the bronchi, which are then furnished with semi-rings only. External tympaniform membranes
exist, with great variations, between the specialized one or two last tracheal and some of the first bronchial rings.

8. Claeoc and Gerontal Organis.

The cloaca is divided by transverse circular folds, which project from its inner walls, into three successive chambers. The innermost, the coprodeum, is an oval dilatation of the end of the rectum, which contains the faeces, and its bottom is formed with a very fluid; it serves entirely as the temporary receptacle of the faeces and the urine. The next chamber, the urodeum, is small, and receives in its dorso-lateral wall the ureters and the genital ducts; the latter are closed below this by the os copulatory, and the former, by which, towards the ventral side, passes into the coating of the copulatory organ when such is present. The urodeum serves only as a passage, the urine being mixed with the faeces in the chamber formed by the second and third meso-oligomyodian. This chamber is closed externally by the sphincter ani; the orifice is quite circular. It lodges the copulatory organ, and on its dorsal wall lies the bursa Fabricii, an organ peculiar to birds. It is most developed in the young of both sexes, is of unknown function, and becomes more or less obliterated in the adult. Only in the ostrich it remains throughout life, being specialized into a large receptacle for the urine, an absolutely unknown function.

The third, the ventral dilatation of the urodeum, is absent in all birds. It is significant that the whole of their cloaca much resembles that of the Crocodilia and Chelyd, in opposition to that of the Lacertilia, which is divided into the third ventral meso-oligomyodian, which is closed externally by the sphincter ani; the orifice is quite circular. It lodges the copulatory organ, and on its dorsal wall lies the bursa Fabricii, an organ peculiar to birds. It is most developed in the young of both sexes, is of unknown function, and becomes more or less obliterated in the adult. Only in the ostrich it remains throughout life, being specialized into a large receptacle for the urine, an absolutely unknown function.

enlarged in the breeding season; in the sparrow, for instance, from the size of a mustard seed to that of a small cherry. The vas deferens descends with many undulations down the lateral side of the rectum, and opens upon a small papilla into the urodaeum. Extraordinary increase in length during the breeding season causes the vas deferens in some of the African weaverbirds to occupy, in a single case, a cavity the size of a lead pencil, and to emerge from it on the left side of the body, and open upon a small papilla into the urodaeum. Many birds, in the act of copulation, throw the cloaca forward to the extent of almost covering the head. The same direction is taken by the ovular canal, which during the season undergoes a process of resorption, and in the winter the whole ovary dwindles to often a diminutive size. In young birds both oviducts are almost equal in size, but the right soon degenerates into an insignificant strand. During every laying season the left duct increases enormously by new formation of its component fibres. For instance, in the fowl its volume increases about fifty-fold, growing from some 0.6 in. in length and scarcely one line in width to more than 2 ft. in length and 1 in. in thickness. The upper, wider opening of the duct is attached by elastic, peritoneal lamellae to the hinder margin of the left lung; the middle portion of the duct is glandular and thick-walled, for the deposition of the albumen; it is connected by a short, constricted "isthmus" (where the shell-membrane is formed) with a dilated "uterus" in which the egg receives its calcareous shell and eventual pigmentation.

B. FOSSIL BIRDS

Much had naturally been expected from the study of fossil birds, but, so far as the making of classifications is concerned, they have proved rather a source of perplexities. So long as the characters of new fossils are only of specific and generic value, it is mostly possible to assign the birds to their proper place, but when these characters indicate new families or orders, for instance Hesperornithes, Ichthyornithes, Palaeolodii, their owners are put outside the more tersely constructed classifications applicable to modern birds. It is no exaggeration to say that the genus, often even the species, can be determined from almost any bone, but in the case of Miocene, and still more, of Eocene fossils, we have often to deal with strange families, which either represent an extinct side branch, or which connect several recent groups with each other. Our artificially-established classifications collapse whilst we gain further insight into the mutual affinities of the existing groups. Of course this must be so if evolution is true. But it also follows that, if every extinct and recent bird were known, neither species, nor genera, nor families, nor orders could be defined. We should be able to construct the pedigree of every group, in other words, the gigantic natural system; but there would be no classification. Much light has also been thrown by fossil birds upon the study of geographical distribution. The key to the distribution of recent groups lies in that of the extinct forms. Not only have many absolutely new families been discovered, but many kinds of modern birds are now known to have existed also in countries which they are now extinct. There were, for instance, trogons, secretary-birds, parrots, and other new Ethiopian forms in Miocene France. Ostriches, indistinguishable from Struthio, have been found in Samos and in the Sivalik Hills. The proper study of fossil birds may be said to have begun with the investigations of amphibia. The Oiseaux fossiles de la France was published from 1867 to 1871. This work deals chiefly with the Tertiary forms. A new impetus was given by O. C. Marsh, who, after 1870, discovered a great number of bird remains in the Cretaceous strata of North America. The most important result is the proof that, until the end of the Cretaceous epoch, most, if not all, birds were still possessed of teeth (see Odonotornithes).

The oldest known bird is the Archaeopteryx (q.v.), of the upper Oolite in Bavaria. The imprints in the enormously older red sandstone or Lower Trias of Connecticut, and originally named Ornithichnites, belong to Dinosaurian Reptiles.

A wide gap separates Archaeopteryx from the next order of fossil birds of the Cretaceous epoch, and, since freshwater deposits of that age are rare, bird remains are uncommon. Many bones formerly referred to birds have since proved to belong to Pterodactyls, e.g. Cimolornis from the English Chalk. But in 1858 were disclosed in the Upper Greensand of Cambridge-shire remains which are now known as Enaliornis. W. Dames has described bones from the Chalk of southern Sweden under the name of Scaniornis, probably allied to Palaeolodii. From the Cretaceous rocks of North America a large number of birds have been described by O. C. Marsh. Of these the most interesting are Ichthyornis, (= Graculavis) and Hesperornis, from the Cretaceous shales of Kansas. They were placed by Marsh in a distinct subclass of birds, Odontornithes (q.v.). Probably all birds of Cretaceous age were still possessed of teeth. Baphornis, another ofMarsh's genera, seems to be allied to Enaliornis, Palaeolodii and Talmatornis, were by him referred to Limicoline and Passerine birds. Laurornis from the Cretaceous marls of New Jersey was as large as a swan.

The lower Eocene has furnished a greater number of bird bones. Some of the latest are those of Gasornis, with three species from France, Belgium and England. Much difference of opinion obtains as to the affinities of these birds, which were far larger than an ostrich; they were undoubtedly incapable of flight and there are indications of teeth in the upper jaw. Provisionally this genus has been grouped with the Ratitae, which at any rate are a heterogenous assembly. Sir R. Owen's Dazornis, of the London Clay, known from an imperfect cranium, and E. D. Cope's Diatryma of New Mexico, based upon a gigantic

![FIG. 17.—Remains of head of Odontopteryx, from the original in the British Museum; side view; natural size.](image)

metatarsus, may also belong there. The London Clay of South England has likewise supplied some long upper arm bones, Argillornis. The most remarkable specimen is a skull, Odontopteryx taliapius (figs. 17, 18); the edges of the jaws were serrated like those of certain tortoises. The character of this skull and the compound rhamphotheca (known by the imprints left upon the jaws) indicate affinities with the Steganopodes. Remnants

The upper Eocene has yielded many birds, most of which are at least close forerunners of recent genera, the differentiation into the leading orders and families being already well marked, e.g. Gallinaceous birds, stork- and crane-like waders, rails, birds of prey, coromants, &c. Especially numerous bones have been found in the Paris basin, chiefly described by G. Cuvier, F. L. P. Gervais, E. Blanchard, and above all by A. Milne-Edwards, and in the equivalent beds of Hampshire. Others have been discovered in Wyoming; a giant penguin, *Palaeoeludytes*, is known from New Zealand, and *Palaeousferozinus* from Patagonia. The Miocene has yielded by far the greatest number of bird-bones, including even eggs and imprints of feathers. For instance, from the lower Miocene beds of Allier and Puy-de-Dôme Milne-Edwards has described about 50 species. Of these *Palaeolodus* was an ancestral flamingo, but with shorter legs; *Limnakornis* is referred to the hoopoes. The existing genera include *Anas*, *Aquila*, *Bubo*, *Columba*, *Cypreolus*, *Lanius*, *Picus*, *Phalarocorax*, *Sula*, &c. Very interesting is the fact that *Serpenatius*, *Psittacus* and *Trogons* are amongst this list of birds, which are now restricted to the tropics. A similarly mixed avifauna has been found in the mid-Miocene beds of various other parts of France, Germany and Italy. In Colorado and New Mexico Marsh has detected bones of *Melegris*, *Puffinus*, *Sula* and *Uria*, all existing genera, but the first is especially suggestive, since it is one of the most characteristic forms of the New World.

Here may be interpolated a short account of the very peculiar avifauna found in the Tertiary strata of Santa Cruz in Patagonia. Instead of the age of lower Eocene, as had been stated originally, these beds are not older than mid-Miocene, and not a few of the bones are of a much younger, even latest Tertiary date. Discovered, and partly described, by F. Ameghino, the bones have been sumptuously monographed by F. P. Moreno and A. C. Maunder, who proposed for them the name of Steevesia. On the other hand, the late Tertiary Dryornis is a member of the Cathartidae or American vultures, and *Mesembriornis*, likewise of late Tertiary date, is a close forerunner of the recent genus *Rhea*.

Piocene remains are less numerous than those of the Miocene. From Pikhervi in Greece is known a *Gallus*, a *Phasianus* and a large *Grua*. From Samos a large stork, *Anhiflopilus*, and a typical *Struthio*; from the Sivalik Hills on the southern flanks of the Himalayas also an ostrich, and another Ratite with three toes, *Hypselestrus*, as well as *Pelecanus*, *Pelecanus* and *Phalarocorax*. The fossil egg of a struthious bird, *Struthidiosaurus*, has been found in the United States, and in China, Dromeos. The Suffolk Crag has yielded the unmistakable bones of an albatross, *Diomedea*.

Most Pleistocene birds are generically, even specifically, identical with recent forms; some, however, have become extinct, or they have become exterminated by man. A great number of birds' bones have been found in caves, and among them some bearing marks of human workmanship. In France we have a large and extinct crane, *Grus primigenius*, but more interesting are the numerous relics of two species, the concomitants of the reindeer, which were abundant in that country at the period when this beast flourished there, and have followed it in its northward retreat. These are the snowy owl, *Nyctea scandiaca*, and the willow-grouse, *Lagopus albus*. A gigantic swan, *Cygnus falconeri*, is known from the Zebeg cavern in Malta. From caves of Minas Geraes in Brazil, O. Winge has determined at least 126 species, of which nearly all still survive in the country.

Kitchin-middens of England, Ireland and Denmark reveal the existence of the capercaillie, *Tetrao urogallus*, and of the great auk or gare-bowl, *Alca impennis*; both species long since vanished from those countries. In the fens of East Anglia have been found two hunnert, one of them immature, of a true *Penelope*, a bird now no longer inhabiting middle Europe.

Until a very recent epoch there flourished in Madagascar huge birds referable to the *Rattae*, e.g. *Aepyornis maximus*, which laid enormous eggs, and not unnaturally recalls the mythical "roc" that figures so largely in Arabian tales. New Zealand has also yielded many flightless birds, notably the numerous species and genera of *Dinornithidae*, some of which survived into the 19th century (see Mos); *Pseudapteryx* allied to the *Kiwi*; *Cnemornis*, a big, flightless goose; *Aptornis* and *Notornis*, flightless rails; and *Harpagornis*, a truly gigantic bird of prey with tremendous wings and talons.

It is, of course, quite impossible, in a survey of extinct birds, to divide them into those which are bona fide fossil, sub-fossil, recently extirpated and partially exterminated. Nor is it possible, except in a few cases, to decide whether they have come to an end through the agency of man or through so-called natural causes. Like other creatures birds have come, some to flourish and stay, others to die out.

Mauritius is famous for the dodo, killed off by man; there was also a curiously crested parrot, *Lophophius* (fig. 19). In the Marc aux Songs have been found the bones of another new tropical bird, capercally, *Fregilamus*. Rodriguez was inhabited by *Penaphas*, the solitaire, *Necropsittacus* and *Palaeornis exigus*, which is now
probably extinct. The Antilles tell a similar tale. The great auk, once common on the British coasts, those of Denmark, the east coast of North America, then restricted to those of Newfoundland, Greenland and Iceland, has been killed by man, and the same fate has overtaken the Labrador duck, the Phillip Island parrot, Nestor productus, and the large cormorant of distribution of animals.” Next we have to mention F. Tiedemann, the Heidelberg anatomist, who has been generally ignored, although he surpassed many a recent zoogeographer by the wide view he took of the problem; in fact he was the first to connect distribution with environmental or bionomic factors; e.g. the remark on p. 451 of his work that “the countries of the East Indian flora have no kinds of birds in common with America which are vegetable feeders.” L. K. Schmarda divided the land into twenty-one realms, characterizing these mainly by their birds. P. L. Sclater was the first to divide the world into a few great “regions,” the Palaearctic, Ethiopian, Indian and Australian forming one group, the “Old World” (Palaeargoa); and the Nearctic and Neotropical forming a second, the Neotropical (Neogaea).

Birds being of all animals most particularly adapted for extended and rapid locomotion, it became necessary for him to eliminate from his consideration those groups, be they small or large, which are of more or less universal occurrence, and to ground his results on what was at that time commonly known as the order Insectores or Passeres, comprehending the orders now differentiated as Passeriformes, Coraciiformes and Cuculiformes, in other words the mass of arboreal birds. His six main divisions—practically adopted by A. R. Wallace & in his epoch-making work—are excellent, taken separately. They express the main complexes of land with their dependencies in well-chosen terms; for instance the “Neotropical region” stands short for South and Central America with the Antilles.

But these six divisions of Sclater and Wallace are not all equivalent, only some are of primary importance; they require co- and sub-ordination. This most important advance was made by T. H. Huxley. Some of the “regions” have now to be called subregions, e.g. the Nearctic and the Palaearctic. The reduction of the Oriental to a subregion, with consequent “provincial” rank of its main subdivisions, will probably be objected to, but these are matters of taste and prejudice. Above all it should be borne in mind that nearly all the last subdivisions or provinces are of very little real value and most of them are inapplicable to other classes of animals.

Besides some occasional references in the text, only a few more of the general works dealing with the distribution of birds can here be mentioned. Special attention has to be drawn to the article “Geographical Distribution,” in Newton’s Dictionary of Birds. See also A. Heilprin, The Geographical and Zoological Distribution of Animals (New York, 1887); W. Marshall and A. Reichenow, two maps with much detail, although badly arranged, in Berghaus’ Physicalischer Atlas, pt. vi. (Atlas d. Thierverbreitung), (Gotha, 1887); A. Reichenow, “Die Begrenzung der voraussichtlich in einem Teil der Welt vorkommenden Vertreter der Thiere,” Zoolog. Jahrb., ii., 1888, pp. 671-704, pl. xxvii.; E. L. Trouessart, La Géographie zoologique (Paris, 1890).

The scheme adopted in the following account stands as follows:

(A) Austro-Gaea or I. Australian Region
   Australian
   Papuan
   Antillean
   Neotropical
   Patagonian

(B) Neogaea or II. Neotropical Region
   (III) Holartic Region
   (IV) Palaearctic
   Nearctic
   Ethiopian
   Oriental

(C) Arctogaea or Region

In the following account the characterization of the various regions and subregions has to a very great extent been adopted from Newton’s article in his Dictionary of Birds, and from the chapter on distribution in the article on “Birds” in the Encyclopaedia Britannica, 9th edition. This applies especially

R. K. Schmarda, Die geographische Verbreitung der Thiere (Wien, 1853).

P. L. Sclater on the general geographical distribution of the members of the class “Aves,” 2. Linn. Soc. ii. pp. 130-145, 1858.

Bering Island, Phalacrocorax perspicillatus; and how long will the flightless cormorant, Ph. harrisi of the Galapagos, survive its quite recent discovery?

C. Geographical Distribution

The study of the extinct organisms of any country leads to a proper appreciation of its existing flora and fauna; while, on the other hand, a due consideration of the plants and animals which may predominate within its bounds cannot fail to throw more or less light on the changes it has in the course of ages undergone. That is to say, the distribution of forms in time is a subject so much connected with the distribution of forms in space, that the one can hardly be separated from the other. Granting this is a general truth, it must yet be acknowledged as a special fact, that in fossil birds we have as yet but scanty means of arriving at any precise results which will justify bold generalization in the matter of avine distribution. Remains of extinct birds are, compared with those of other classes of vertebrates, exceedingly scarce, and these have been found in very few, widely separated countries. The great problems involved in the study of geographical distribution must therefore be based mainly upon the other classes, both vertebrate and invertebrate, which, moreover, enjoy less great facilities of locomotion than the birds.

Yet it so happens that the great zoogeographical regions of the world, now more or less generally accepted, have been based upon the distribution of birds. The whole subject was properly introduced by Treviranus, who in his large philosophical work devotes considerable space to the “geographical

1 Treviranus, Biologie oder Philosophie der lebenden Natur, vol. ii. cap. 4, § 2 (Göttingen, 1803).
to those instances in which the members of families, genera, and species are mentioned. The families are those which are enumerated in Garow's classification. The numbers of genera and species of birds are, of course, a matter of personal inclination. If we take a moderate rough computation the number of recent species may be taken at 10,000-11,000. Dr. R. B. Sharpe increases their number to about 15,000 in the New Handbook of Birds, published by the British Museum. In the first two volumes fossil birds, occasionally based upon a fragmentary bone only, are also included.

(A) Austrogae, the Australian region in the wider sense, with the Papuan, Australian and New Zealand subregions, including also Polynesia. We may here quote Newton (Encyclopedia Britannica, 9th ed.), "The Papuan region is an appendage between this region and the rest of the Old World;" the prevalent zoological features of any Region are of two kinds—negative and positive. It is therefore just as much the business of the zoogeographer, who wishes to arrive at the truth, to ascertain what groups of animals are wanting in any particular locality (altogether independently of its extent) as to determine those which are forthcoming there. Of course, in the former case it would be absurd to regard as a physical feature of any great value the absence from a district of groups which do not occur except in its immediate neighbourhood; but when we find that certain groups, though abundant in some parts of the vicinity, suddenly cease to occur, it appears a matter of reduced numbers, and occasionally in abnormal forms, the fact obviously has an important bearing. Now, mere geographical consideration taken from the situation and configuration of the islands of the so-called Indian or Malay Archipelago, would indicate that they extended in an unbroken series from the shores of the Strait of Malacca to the southern coast of New Guinea, which confronts that of New South Wales. But it is to the eastward which the true, very necessary, Australia, often applied to this part of the world, would induce the belief that the all the islands, be they large or small—and some of them are among the largest on the globe—were in fact portions of the same land of Asia. But so far from this being the case a very definite barrier is interposed. A strait, some 15 m, or so in width, and separating the two widely but otherwise insignificant islands of Bali and Lombok, makes such a frontier as can hardly be shown to exist elsewhere. The former of these two islands belongs to the Indian Region, the latter to the Australian, and between them there is absolutely no trace of the species that is, so to both groups, cannot be easily accounted for by the various accidents and migrations that in the course of time must have tended to mingle the productions of islands so close to one another. The fauna of the two are as absolutely distinct as those of South America and Africa, and it is only because they are separated by a narrow strait instead of the broad Atlantic that they have become so slightly connected by the interchange of a few species and genera.

1 Now, first, of the forms of birds which are prevalent throughout the Indian Region, but are entirely wanting in the Australian, we have at once the bulbuls (Ixvdae), very characteristic of most parts of India. The Phylloscopidae, which are peculiar to the Indian Region; the widely-spread families of barbets (Megalaimidae) and vultures (Vulturidae); and the pheasants (Phasianidae), which attain so great a development in various parts of the Indian Region, all belong to the suborder which must not be regarded as fixed. Some naturalists would add the finches (Fringillidae), rightly if we assume that the Ploceidae or weavers constitute a separate family. Then, of forms which are but weakly represented, we have the otherwise abundant thrushes (Turdidae), and, above all, the woodpeckers (Picidae), of which only very few species, out of 400, just cross the boundary and occur in Lombok, Celebes or the Moluccas, but are unknown elsewhere in the region.

But the Australian region is also remarkable for its ornithic singularity. All the existing Rattic (with the exception of the ostrich, and the elephant bird of South America, belonging to the genera Struthio and Rheas, and comprising at most only five species) are confined in Austrogae and nowhere else. Of the Passeres the honey-suckers (Maliphagidae) are most characteristic, and, abounding in

1 The following old-fashioned rough computation may serve an indication of the relative size of the orders and suborders of recent birds:—

Raphidia 20
Sphenisciformes 15
Gaviiformes 15
Charadriiformes 650 (incl. Columbidae)
Colymbiformes 20
Ciconiiformes 150
Sphenisciformes 600 (incl. Pasticci)
Procellariiformes 150
Gaviiformes 1600 (incl. Trochilidae)
Anseriformes 130
Geognathornithiformes 150
Ciconiiformes 1000
Pelecaniformes 600
Charadriiformes 250
Gruiformes 1000
Sphenisciformes 350
Gaviiformes 150
Sphenisciformes 250
Gaviiformes 1000
Aves 300

The boundaries of the subregions are not well defined.

The New Zealand Subregion, considered by Professors Newton and Huexley and various other zoogeographers as deserving the rank of a region, is, and to all appearance has long been, more isolated than any other portion of the globe. Besides the three larger islands numerous satellite islands belong to the subregion, as Lord Howe, Norfolk and Kermadec islands, with the Chatham, Auckland and Macquarie groups. The main affinities of the avifauna are, of course, Australian. The most extraordinary feature is unfeasibly the former existence of the gigantic Dinornithes or moas (q.v.) and, another family of Rattia, the weird-looking kiwis or Apterygys, which are totally unlike any other existing birds. Of other peculiar genera it

will suffice to mention only the more remarkable. The Ratilidae present the very noteworthy woolhens, Ocydromus, and the takahi, Notornis, which is almost extinct. The widely-spread plowers, Charadriidae, have two not less singular generic developments, thinus and the extraordinary wrybill, Anarhynchus. There is an owl, the genus Scolopacidae. Of parrots, Sittagps, the kakapo or owl parrot is certainly peculiar, while Nestor constitutes a peculiar subfamily of the brush-tongued parrots or Trichoglossidae. Xenicus and Acanthisitta form a little family of truly mesomydian Passeres Clamateros. Of the Maliphagidae the genera Prothamnernectes, Pogonornis and Anithornis are peculiar. The starlings, Sturnidae, are represented by Callaeas, Creation and the very abnormal Heterorhina. The gallinaceous birds are represented by the psitac, Columba novaelandiae, now exterminated. A large flightless goose, Ansericornis, allied to the Australian Cereopsis, and the gigantic rupis Haporgone, have died out recently, with the moas. In all, there is a wonderful amount of specialization, though perhaps in a very straight line from generalized forms; but the affinity to Australian or Polynesian types is in many cases clearly traceable, and it cannot be supposed but that these last are degenerate offspring of those of New Zealand. A very long period of isolation must have been required to produce the differences so manifestly to be observed, but a few forms seem at rare intervals to have immigrated, and this immigration would appear to be kept up in our own day, as shown by the instance of Zosterops lateralis, which is said to have lately made its first appearance, and to have established itself in the country, as well as by the fact of two cuckoos,
the widely-ranging *Endomychis taitensis* and *Chreoscyrso lucidas*, which are annual visitors.

**Polynysia** forms, of course, part of Austroagae. Its extent is so vast that it necessarily contains some peculiar, outlying forms, so to say forms. The word "Outlying" here signifies something that is not altogether foreign to itself, or that is largely developed by selective means, to suit itself to the conditions of its environment. For instance, the kagu (*Rhinocheta*) of New Caledonia, a queerly specialized form with Grünne affinities pointing only to South America. The tooth-billed pigeon (*Diduncula*) is restricted to South America, and *Macroura* is found in the West Indian Archipelago. In the **Australian Subregion** we find a remarkable example of the same extraordinary development of its peculiar family *Drepanidae*, which includes all of the Australian pigeon and their allies. There is a raven (!), a coot (!) and the scrub-bird (Atrichia). Among the more curious forms of other land-birds may be especially mentioned the *Megapodidae*, *Lophorina* and the rail *Tribonyx*. The subfamily *Microdactylinae* represents the characteristic Tasmanian Turdus in Australia. The presence of bustards (*Evodotis*) is a curious example of interrupted distribution, since none other of the Otidae are found nearer India to the west. *Pteridacis* represents two species each of *Dromaeus*, besides the cassowary of Cape York peninsula, and the extinct Dromornis and Genyornis with its enormous skull.

The *Papuan Subregion*, chiefly New Guinea with its dependencies, the Timor group of islands, the Moluccas and Celebes, is one of the world's peculiarities. On the whole its avifauna presents some very remarkable features. Its most distinctive characteristic is the presence of the birds of paradise, the most peculiar and bizarre of all birds. The phrase has been coined for catching a bird of paradise in Australia, to indicate that this is a peculiar and bizarre group of birds. The presence of birds of paradise, Chlamydotis and others, of Australia, belong to the same family; they are far less highly specialized than the beautiful and extraordinary forms which are found, within very restricted limits, along the coast of the South American continent. Another remarkable feature of Australia is the extraordinary development of the cassowaries, the richness and specialization of the kingfishers, parrots, pigeons, honey-suckers and some remarkable flycatchers. It has several marked deficiencies compared with Australia, among which are the honey-guides (Timetidae), the blackbirds (*Platyssecinae*) among parrots, diurnal birds of prey and the emus. As a whole, the birds of Papua are remarkable for their brilliance of plumage, or their metallic colouring. The birds of paradise, the racquet-tailed kingfishers, *Tanyopidae*, the largest and smallest of parrots, *Calyptrornis* and *Atrichia*, and the great crowned pigeons, *Goura*, are very characteristic. As is the case with the avifauna of various lands, the early explorers have given the birds very incorrect names. On Australia we find that the number of species amounts to about 3600. Of these, 2000, or a good deal more than half, belong to the order Passeriformes. But the total number of the species of which the Avifauna is most certainly brought out when we learn that of the 2000 species just mentioned only about 100 belong to the higher suborder of Oiscines, that means to say, nearly one-half belong to the lower suborder Cllamatorres. This is a state of things which exists nowhere else; for except in Australia, where a few indigenous and peculiar low-non-Oiscines are found, and in the Nearctic country, whither one family of Chlamatores, viz. the Tyrannidae, has evidently been led by the geographical conditions of the country to make itself felt. It is an anomaly that of the 2000 species of birds that Australia possesses, none of them do not occur elsewhere. According their disproportionate prevenient in South America points unerringly to the lower rank of the avifauna of Australia, and this is the state of things which existed before the formation of putting it next in order to that of the Australian region, the general fauna of which is admitted by the lowest in the world. Huxley has urged with his usual perspicacity the alliance of these two regions, which, besides their regional affinities, are substantially related in the same evidence, in great measure on the evidence afforded by the two main sections of the Galli, viz. the *Peristeropodes* and the *Alectoropodes*, the former composed of the families *Mepapidae*, almost wholly Australian, and the *Cacatuidae*, entirely Neotropical. (Cf. D. S. 1868. pp. 294-319.)

Leaving, however, this matter as in some degree hypothetical, we have some genera, or perhaps even larger groups, a great many very remarkable forms which are characteristic of, or peculiar to, the Neotropical region in part, if not as a whole. Of these we may mention the curious family *Hirundinidae*, which besides at least eight groups, which are peculiar to the New World, and extend their range into the Nearctic region, but are there so freely developed that their original may be safely ascribed to the southern hemisphere. The *Rhamphastidae*, or the extraordinary family of humming-birds (*Trochilidae*), which are by far the most numerous of all birds, and have the most peculiar forms, are confined to South America, and one of the most extraordinary is the *Tandayapa*, a bird of the **Antillean Subregion**, remarkable for its presence, and nearly 150 genera (of which only three occur in the Nearctic region) and than species. Then the tyrants (*Tyrannidae*), or, with seventy genera (ten of which range into the northern region), and over 300 species. To these follow the tanagers (*Tara-gridae*), with upwards of forty genera (only one of which crosses the border) and about thirty species. Certain other birds, such as the ant-thrushes, *Formicariidae*, with more than thirty genera, and nearly 200 species; all of which, although they are not peculiar to any one country, are by no means as clearly defined as many other birds. The antbirds, or *Thraupidae*, the cacamars (*Galbulidae*), the motmots (*Momotidae*), the todies (*Todidae*), the trumpeters (*Phapsiphinae*), and the screamers (*Pala-medidae*); besides such isolated forms as the seriemas (*Cariama*) and the sun-bittern (*Eurypteryx*). The nature of the South American avifauna will perhaps become still more evident if we arrange the characteristic groups as follows:

1. Birds which are restricted to, probably indigenous of the **Antillean**: *Tandayapa*; *Hirundinidae*; *Rhamphastidae*, *Diniphrastidae*, *Thinocorys* and *Attigas*; *Cacatuidae*; *Opisophomus*; of parrots *Ara* and *Cacatua*; with their allies, *Monotis*, incl. *Todus*; *Sloctenius*; *Galeophasia*. Besides *Formicariidae*, *Pteropodidae*, of the *Tyrannidae* the Cotinginae.

2. Birds which are indigenous, but extend far into North America: *Cathartes*, *Tyrannidae*, *Tyrannidae*.

3. Birds which are primarily immigrants from North America: *Pollicipespoli*, with the lightless *Centropela* on *Lake Titicaca*, *Ceryle*, the only genus of kingfishers in the New World; all the *Ostrea*.

More or less cosmopolitan groups like herons, *Todinae*, *Anseres*, *Columbae*, etc., and circumtropical families like *Parridae*, *Trogodinae*, *Capitolineae*, are to be excluded from these lists as indifferent. The **Tyrannidae**, the family of birds upon which the Neotropical region hinges, is a remarkable example of the development which America is fundamentally and prove the independence or superior value of the Neotropical region as one of the principal realms.

It is difficult to subdivid the Neotropical region into sub-regions; the best suggestion is that of Newton: **Antillean**, with the exception of the islands of Trinidad and Tobago, as well as those which lie on the northern coast of South America; **Patagonia**, including Chile and part of Peru; **Columbian**, comprising the rest of the continent and all Central America.

The **Antillean Subregion** is in many respects one of the most suggestive and interesting, comparatively small though it be. For nearly all of this country are in the near stem of the Central America, between the Bahamas and Florida, and between Grenada and Tobago, the fauna of the Antillean chain, instead of being as a whole, the most remarkable, is very much diversified, and exhibits in some groups a degree of specialty which may be not unfitted with that of oceanic islands. Except such as are of coral formation, the Antillean are billy, not to say monotonous; the only places to an elevation of 8000 ft., and nearly all, prior to their occupation by Europeans, were covered with luxuriant forest, which, assisting in the collection and condensation of the clouds brought by the trade winds, ensured its own vitality by precipitating frequent and long-continued rains upon the fertile soil. Under such conditions we might expect to find an exceedingly plentiful animal population, one as rich as that of South America. In the **Patagonian Subregion**, however, the extent of land so highly favoured by nature is so poorly furnished with the higher forms of animal life. Here, as over so large a portion of the American region, we find birds constituting the supreme class of the region. Being exterminated in some special manner, as a normal effect of insularity.

There is one peculiar subfamily, *Todinae*, represented by only four species, *Todus*; *Phalacrocoracidae*, and *Rhamphastidae*, and any of those gruiform genera which are so characteristic of the continent. There is no family of birds common to the Nearctic area and the Antillean subregion without occurring elsewhere. One of the chief suborders of the Neotropical region, the **Microcousidae**, is peculiar to South America, and to an extraordinary extent to the same suborder, which is naturally devoid of a good many typically tropical forms. But the **Patagonian Subregion**, most extratropical, is naturally devoid of a good many typically tropical forms. But the **Patagonian Subregion**, most extratropical, is naturally devoid of a good many typically tropical forms.
DISTRIBUTION

features of the whole region are here well represented, e.g., Rhea, Timami, Chonupa, Diclophus, Atttagis, Petroilophinae, and indeed we find some of the best evidence of the antiquity of its position. The last-mentioned family is the Discover, and we have been able to get a clear view of the Neotropical regions, including the Palaearctic and Nearctic subregions, and the Faunistic problems of the Nearctic subregion.

The Nearctic Subregion.—The affinity of Nearctic birds with the Nearctic subregion becomes at once apparent when we exclude the groups of birds which we have good reason to believe have their original home in the Nearctic region, notably numerous Tyrannidae, humming-birds, and the turkey-buzzards.

Such groups may be mentioned as characteristic and typically American, and, since we consider them as comparatively recent immigrants into the Nearctic region, as originally peculiar to the Nearctic region: Myioborus, Oryzomyas, Ictidae, Stenopidae, and others. Restricting our attention to the Nearctic subregion only is the only Osprey family of Chamaeleoninae, restricted to the coasts of the Nearctic region. More than one-third of the genera of Nearctic birds are common also to the Nearctic subregion. If we restrict our attention to the Nearctic subregion, we find that, besides the Nearctic, there are about 120 common to the two regions. Nearctic birds in the Nearctic subregion are occasional, and about 50 are Nearctic, which from time to time stray to Europe or Asia. This, however, is by no means the only point of resemblance. Of many genera, the so-called species found in the Nearctic subregion are often found in the Nearctic subregion. It is often possible but not an expert can distinguish them, and of such representative 'species' about 80 might be enumerated (Newton, Dict. Birds, p. 335).

Of other attempts to divide the Nearctic subregion, the same authority favours that of Dr. S. F. Baird, who distinguishes between Canadian, Alleghanian, Middle or Missourian, Californian, and Alaskan provinces.

Dr. Hart Merriam takes the broad point of view that the whole of extratropical North America consists of but two primary life regions, a Boreal region, which is circumpolar, and a Sonoran or Mexican tableland region which is unique. The first of these supports Newton's contention of the essential unity of the Nearctic and Palaearctic areas. In any case the various Nearctic subregions completely merge into each other, just as is to be expected from the physical configuration and other biomic conditions of the Nearctic area.

The Nearctic Subregion is, broadly speaking, Europe and Asia, with the exception of China and the Himalayas. The province of composition of this region is the Great American moist forest belt, which is first shown by Dr. P. L. Sclater, and as regards the distribution of most classes of animals there have been few to doubt that it is an extremely natural one. Not indeed altogether so homogeneous as the Nearctic subregion, but with a more variable climate, its exceptional species, and its very striking difference between the bulk of its birds. Though far removed from the western Europe, and though a few generic forms and subfamilies inhabit the one without also frequently the other, yet there is a notable similarity in a large part of the latter subregions. In some cases the closest examination has failed to detect any distinction that may be called specific between the members of their avifauna; but in most it is possible to discover just sufficient difference to warrant a separation of the subjects. Nevertheless, it is clear that in Japan we have, as it were, a repetition of some of our most familiar species—the red-breast and the herring-sparrow. This is very noticeable in the management of their songs, as to furnish instances of the most accurate representation, e.g., Cyanopica cyanus of Portugal and Spain, and C. cyana of Moorland and Asia.

Like the Nearctic the Palaearctic subregion seems to possess but one single peculiar family of land birds, the Panuridae, represented by the beautiful species known to Europeans as the bearded tit-mimics. The few subfamilies that are characterized by the Nearctic families, are, according to Newton, 67, and of the genera 332. Of these 128 are common to the Nearctic subregion. Species of 51 more seem to occur as true natives within the Ethiopian and Indian regions. Though these 18 appear to be common to the region, that without being found in the Indian, and no fewer than 71 to the Indian without occurring in the Ethiopian. To compare the Palaearctic genera with those of the Nearctic subregion is a hazardous time of the year, for the points of resemblance are extremely few, and such as they are lead to nothing. It will therefore be seen from the above that next to the Nearctic area the Palaearctic has a much greater affinity to any other, a fact which might be expected from geographical considerations.

Having shown this much we have next to deal with the peculiarities of the Palaearctic subregion. The Palaearctic is the region of the Eurosiberian and Eurosiberian elements. The Palaearctic genera seem to be peculiar to it, though it is certain that species of several are regularly won to wander beyond its limits in winter following a southern climate. Of the Palaearctic genera only a few examples shall be named. 

Bullula, the sandpiper of Siberia; Syrhopus, the sandgrouse of central Asia; Musciops of Europe.

We notice a well-marked contrast between the Palaearctic and the Nearctic subregion, and the same holds true of the Palaearctic and the Nearctic subregion, and of the Nearctic and the Ethiopian subregion. The natural division of the Ethiopian subregion lies between the tropics that no surprise need be expressed at the richness of its fauna relatively to that of the last two subregions we have considered. Between fifty and sixty so-called families of land birds alone are found within its limits, and of them at least nine are peculiar, the typical genera of which are Buphaga, Erycros, Philepitta, Musophaga, Irrisor, Loxosoma, Colius, Serpentarius, Struthio, Astrapia, and the like. Among the first three belong to the Passeriformes, a proportion which is not maintained in any other tropical region. The number of peculiar genera, besides those just mentioned, is too great for them to be named here; some of the representatives are Austrelux, merlin, and the large-headed heron; Balearica, the crowned crane; Podica, finfoot; Numida and allied genera of guinea fowl.

The natural division of the subregion is that into an African and a Madagascar province. Subdivision of the continental portion is best with great difficulties, and none of the numerous attempts have proved long-lived. The forest-clad basin of the Congo, with its tributaries, the bed of Guinea, seem to form one domain in opposition to the rest.

The Malagasy province comprises, besides Madagascar, the Mascarene, Comoro and Seychelles islands. It may be safely deemed one. The peculiar animal characteristic of Madagascar, and its multiformness of its animal, and especially of its ornithic population, New Zealand cannot be compared with it. In A. M. C. P. (A. M. C. P., vol. ii. (Paris, 1875–1884), are enumerated 258 species as belonging to the island, of which 129 are peculiar to it, and among those no fewer than 33 peculiar genera. Erycros of the
Oscines, and *Philepitta* of the Clamatoridea, are remarkable enough to form the types of Passeriform families, and *Miesies* half-way between Galli and Grufornes is of prime importance. The Passerine *Fuscusa*, with its recently extinct allies *Fregilupus* and *Neotropicus* of the Mackerones; the Coracine *Brachypterygus*, *Aletornis* and *Geosittes*, are very abundant, while *Heliodus* is an owl belonging to that subfamily which is otherwise represented only by the widely-spread barn owl, *Strix flammea*. Lastly must be noted the extinct tall Ratite species of *Aepyornis* with its several fancy genera. But, as Newton charmingly puts it (*Dict. Birds*, p. 533), the avifauna of Madagascar is not entirely composed of such singularities as these. We have hitherto general, even among the true Passeres, occurring there—such as *Alauda*, *Arcephalus*, *Motacilla* and *Piprischita*, while the *Cisticola* madagascariensis is only distinguishable from the well-known fan-tailed warbler, *C. schoeniciola* of Europe, Africa and Asia by its rather darker coloration. But there are also species, though not Passerine, which are absolutely identical with those of Britain, the barn owl, common quail, pigmy roller, and little grebe or dabchick, all of them common and apparently resident in the island. Mauritius had the dodo (q.v.), *Lophotislicus* and *Aphanapteryx*. Rodriguez had the solitaire, *Necropitias* and *Neoropos*. Bourbon or Réunion had *Fregilupus*.

Some of the Malagasy avifauna is certainly ancient, aboriginal, and even points to India; other forms indicate clearly their African origin; while, lastly, such strikingly characteristic Indo-African birds as hornbills are unaccountably absent.

The Oriental Subregion comprises all the countries and numerous islands between the Palearctic and Australasian areas; it possesses upwards of seventy families, of which, however, one ten is peculiar, but this family, the *Eurylaemidae* or broadbills, is of great importance since it represents all the Subclamatoridae. Of the many characteristic birds may be mentioned *Pycnonotidae* or bulbuls, of which the *Phyllostomidae* are peculiar, *Campephagidae* or cuckoo-shrikes, *Diarurae* or drongos, *Nectariniidae* or sunbirds; pheasants, together with *Pavo* and *Callops*. Some of the similarities to the Ethiopian and the great differences from the Australian avifauna have already been pointed out. Naturally no line whatever can be drawn between the Oriental and the Palearctic subregions, and many otherwise essentially Indo-Malayan families extend far into the Australian realm, far across Wallace's line, whilst the reverse takes place to a much more moderate extent. Certainly the Oriental area, in spite of its considerable size, cannot possibly claim the standing of a primary region. It is a continuation of the great Arctogaea into the tropics.

Following H. J. Elwes we subdivide the whole subregion into a Himalo-Chinese, Indian and Malayann province. These divisions had the approval of W. T. Blanford, who proposed the terms Cis- and Transgaetic for the two first. The Himalo-Chinese or Transgaetic province shows the characteristics of its avifauna also far away to the eastward in Formosa, Hainan and Cochinchina, and again in a lesser degree to the southward in the mountains of Malaccas and Sumatra. Indo-China is especially rich in *Eurylaemidae*, China proper and the Himalayas in pheasants.

The Indian or Cisgaetic province is the least rich of the three so far as peculiar genera are concerned.

The Malayan province comprising the Malay islands, besides the Malay peninsula, and the very remarkable Philippines possesses an extraordinary number of peculiar and interesting genera.

The influence of the Australian realm is indicated by a Megapode in Ceylon. *Habu I. Labbardianus* and a third in the Nicobar islands (which, however, like the Andamanese belong to the Indian province), but there are no cockatoos, these keeping strictly to the other side of Wallace's line, whence we started on this survey of the world's avifauna.

D. CLASSIFICATION OF BIRDS

Fürbringer's great work, published in the year 1888 by the *Natura Artis Magistra* Society of Amsterdam, enabled Gadow not only to continue for the next five years the same lines of morphological research, but also to investigate those questions which were still left in abeyance or seemed to require renewed study. The resulting "classification is based on the examination, mostly autopic, of a far greater number of characters than any that had preceded it; moreover, they were chosen in a different way, discernment being exercised in siting and weighing them, so as to determine, so far as possible, the relative value of each, according as that value may vary in different groups, and not to produce a mere mechanical 'key' after the fashion become of late years so common." (Newton's *Dictionary of Birds*, Introduction, p. 103). It is not the quantity but the quality of the anatomical and bionomic characters which determines their taxonomic value, and a few fundamental characters are better indications of the affinities of given groups of birds than a great number of agreements if these can be shown to be cases of isomorphism or heterophyletic, convergent analogy. Nature possesses three great educational or developmental schools—terrestrial, aquatic and aerial life. Each of these affords animal, vegetable or mixed diet. Animal diet implies the greatest variety with regard to locality and the modes of procuring the food. Each of these schools impresses its pupi, in the case of the birds, with its own stamp, but there are many combinations, since in the course of phyletic development many a group of birds has exchanged one school for another. Originally terrestrial groups have taken to an entirely aquatic life, and vice versa; others, originally endowed with the power of flight, have become, or are transforming themselves into, absolutely cursorial forms; some members of one group live entirely on seeds, while others have become fierce fishes, and so forth. Only by the most careful inquiry into their history can their relations or pedigree be unravelled. A statement may now be given of Gadow's classification of birds, in which the extinct forms have been intercalated so far as possible. The few characters assigned to the various groups are sufficiently diagnostic when taken together, although they are not always those upon which the classification has been established:—

CLASS AVES

I. Sub-class *Archaeornithes*—The three fingers and their metacarpals remain separate, each with a claw. Well-developed remiges. Both jaws with alveolar teeth. Amphicoelous. Caudal vertebrae more than thirteen, without a pygostyle, but with about twelve pairs of rectrices. *Archaornexia*, *A. lithographica*, *s. macorea*, two specimens from the upper Oolite of Solenhofen, Bavaria.

II. Sub-class *Neornithes*—Metacarpals fused. Second finger the longest. Not more than thirteen caudal vertebrae.

3. Order **Casuarii.**—Three toes. Aftershaft as long as the other half. Casuarius and Dromaeos, Australian. Hypsiporos, Ploceon of Sivalik Hills.

6. Order **Aepyornithes.**—Aepyornis, recently extinct, Madagascar.

To the Ratitae belong possibly also the imperfectly known Diatryma, Eocene. New Zealand. Gigantorhith and Dinorhith, Eocene of Europe. Genyornis, Plsteocence of Australia.

II. Division **Oontolae.**—Marine, flightless, without sternal keel. Upper and lower jaws with teeth in furrows. Cretaceous epoch. Enalornis, Europe, vertebrae chiefly biconcave; *Hesperornis,* North America, vertebrae heterocercous.

III. Division **Carinatae.**—With keeled sternum.

2. Order **Cyclornithes.**—Plantigrade, aquatic. All toes webbed, fourth largest, hallux short; metatarsus laterally compressed; tibia with high, pyramidal crest. Bill straight, pointed, with single tooth. *Withnaresimperviae.*

Sub-order 1. **Cormyli.** Divers, Front toes completely webbed. Holarctic. *Columbus.*

5. Order **Ciconiiformes.**—Swimmers or waders. Desmognotous, without basipterygoid processes; with one pair of sternotracal muscles.

Sub-order 1. **Steganopleg.**—Well flying, aquatic, nidicolous; with all the four toes webbed together; Rhamphotheca compound; cosmopolitan. *Pelecanus,* tropic-bird; *Sula,* gannet; *Phalacrocorax,* cormorant and plotus, snake-bird; *Pelecanus,* ibis-bird; *Pelecanoides.* Here also *Pelargornis,* Miocene of France; *Argyornis* and probably *Odontopteryx* from the London Clay.

Sub-order 3. **Ciconia.**—Zooplagious, nidicolous, waders; with simple hypotarsus and without cervical apertia. *Ciconiidae,* storks. *Ibis,* ibises and spoonbills.

6. Order **Anseriformes.**—Desmognotous, nidicolous; with two pairs of sternotracal muscles; with complete basipterygoid processes and with a penis.

Sub-order 1. **Palameae.**—Screamers. Riles without arcus; *Anas* without hypotarsus; *Pelecanorhith.* Neotropical. *Anas.*

Sub-order 2. **Anseres.**—Family *Anatidae.* Hypotarsus complex. *Anser,* *Anatura,* *Cygnus,* since Miocene.

Sub-order 3. **Ciconiiformes.**—Swimmers or waders. Desmognotous, without functional caeca. Terrestrial, aerial.

Sub-order 1. **Cathartae.**—American vultures. With nares perviae. *Cathartes,* turkey buzzards, *Sarcohampus* *kyphus,* condor *Cypagopus* *bpper,* king vulture.

Sub-order 1. **Cathartae.**—American vultures. With nares perviae. *Cathartes,* turkey buzzards, *Sarcohampus* *kyphus,* condor *Cypagopus* *bpper,* king vulture.

PICI. the Zygodactylous. It the four second branched characters, when the lower and upper "foot" are taken in a similar sense comes, the phrase "bird's-eye maple," a speckled variety of maple-wood, or the "bird's-eye handkerchief" mentioned in Thackeray's novels.

**Birdsnesting,** a general term for the practice of collecting and preserving birds' eggs, with or without the nests themselves. The nests and eggs of wild birds are nowadays protected by local laws almost everywhere in both Great Britain and the United States. By law they may be taken for scientific purposes only, by special licence. In order not to interfere seriously with the young, it is customary to leave nests alone if the nest itself be taken, to wait until the young birds have left it. Every egg, unless "hard-set," should be blown as soon as removed from the nest.

This is done by opening a small hole in its side by means of a drill with a conical head, manufactured for the purpose, a minute hole for the insertion of the drill-head having first been made in the shell with a needle, which is then used to stir up the contents, so that they shall flow easily. A blow-pipe with a curved mouth is then inserted, the egg is held hole downwards, and the contents blown out. The old-fashioned method of removing the egg from the shell is quite different. Should the egg be "hard-set" a somewhat larger hole is made and its edges reinforced with layers of paper pasted round them. Minute forces are then introduced and the embryo cut into pieces small enough to pass through the hole. The inside of the egg is then rinsed out with clean water, and also before being placed in the cabinet, with a solution of corrosive sublimate, which prevents decay and consequent discoloration of the inner membrane. Finally the egg is placed with the hole downwards upon a sheet of white blotting-paper to dry. The authentication of the eggs is the most important duty of an egg-collector, next to identifying the bird in the egg if the latter is possible. The method is to mark with a fine pen on the egg itself the variety, scientific name, locality of nest, date of taking and the initials of the collector, as well as a reference to his note-book or catalogue. Others advocate keeping the authentication separate with only a numbered reference on the egg itself. Eggs should not be transported in bran or sawdust, but in strong wool-lined boxes. The best cabinets are fitted with drawers, pulled out to inspect the eggs, but at other times closed to preserve them from the light, which is injurious to their delicate colouring. If the interior nests of birds should be disinfected with hypo- sulphite of soda or insect-powder.

**Neornithes**

The Odonata seem to be an early specialized offshoot of the Colymbomorphae-Pelagornithae brigade, while the Ratitae represent a number of side branches of early Alectorornithae. The Ratitae branched off, probably during the Eocene period, from that still indiffereent stock comprising the third or fourth legions of the Gallo-Galliformes, when the members of this stock were still in possession of those archaic characters which distinguish Ratitae from Carinatae. It follows that new groups of Ratitae can no longer be developed since there are no Carinatae living which still retain so many low characters, e.g. configuration of the palate, precocairoid, pelvis, intestinal convolutions, copulatory organ, &c. Loss of the keel is co-ordinated with the power of using the forelimbs for locomotion; although a "Ratite" character, it is not sufficient to turn a Notornis, Ciconiere, or Stringops, not even a Phororesicus into a member of the Ratitae. Another branch of the Alectorornithae, in particular of the Galliformes, when these were still scarcely separated from the Gruiformes, especially rai-like birds, leads through Opiathecini to the Cuculiformes. These are, again, in an ascending direction, connected with the Coraciiformes, out of which have arisen the Pterocnemididae, and these have blossomed into the Oiscines, which, as the apotaxis of bird life, have conquered the whole inhabited world.

**Bird-louse**

Any small flat degenerate wingless neuropteron insect of the group Mallophaga, parasitic upon birds and mammals and feeding upon dermal excretions or upon the softer parts of hair and feathers. The term "biting-lice" is sometimes given to these parasites, in allusion to the mandibulate character of their mouth-parts, which serves to distinguish them at once from the true lice of the order Rhynchota in which the jaws are haustellate.

**Bird's-eye,** a name applied to various small bright flowers, especially those which have a small spot or "eye" in the centre. The primula is thus spoken of, on account of its yellow centre, also the adonis, or "pheasant's eye," and the blue veronica, or germander speedwell. The word is also applied to a sort of tobacco, in which the stalks (of a mottled colour) are cut up when the leaves are taken in a similar sense comes, the phrase "bird's-eye maple," a speckled variety of maple-wood, or the "bird's-eye handkerchief" mentioned in Thackeray's novels.

**Birdsnesting,** a general term for the practice of collecting and preserving birds' eggs, with or without the nests themselves. The nests and eggs of wild birds are nowadays protected by local laws almost everywhere in both Great Britain and the United States. By law they may be taken for scientific purposes only, by special licence. In order not to interfere seriously with the young, it is customary to leave nests alone if the nest itself be taken, to wait until the young birds have left it. Every egg, unless "hard-set," should be blown as soon as removed from the nest.

This is done by opening a small hole in its side by means of a drill with a conical head, manufactured for the purpose, a minute hole for the insertion of the drill-head having first been made in the shell with a needle, which is then used to stir up the contents, so that they shall flow easily. A blow-pipe with a curved mouth is then inserted, the egg is held hole downwards, and the contents blown out. The old-fashioned method of removing the egg from the shell is quite different. Should the egg be "hard-set" a somewhat larger hole is made and its edges reinforced with layers of paper pasted round them. Minute forces are then introduced and the embryo cut into pieces small enough to pass through the hole. The inside of the egg is then rinsed out with clean water, and also before being placed in the cabinet, with a solution of corrosive sublimate, which prevents decay and consequent discoloration of the inner membrane. Finally the egg is placed with the hole downwards upon a sheet of white blotting-paper to dry. The authentication of the eggs is the most important duty of an egg-collector, next to identifying the bird in the egg if the latter is possible. The method is to mark with a fine pen on the egg itself the variety, scientific name, locality of nest, date of taking and the initials of the collector, as well as a reference to his note-book or catalogue. Others advocate keeping the authentication separate with only a numbered reference on the egg itself. Eggs should not be transported in bran or sawdust, but in strong wool-lined boxes. The best cabinets are fitted with drawers, pulled out to inspect the eggs, but at other times closed to preserve them from the light, which is injurious to their delicate colouring. If the interior nests of birds should be disinfected with hypo- sulphite of soda or insect-powder.

**Birds of Paradise,** a group of passerine birds inhabiting New Guinea and the adjacent islands, so named by the Dutch voyagers in allusion to the brilliancy of their plumage, and to the current belief that, possessing neither wings nor feet, they passed their lives in the air, sustained on their ample plumes, resting only at long intervals suspended from the branches of lofty trees by the wire-like feathers of the tail, and drawing their food "from the devils of heaven and the nectar of flowers." Such stories obtained credence from the fact that so late as the year 1760, when Linnaeus named the principal species apoda, or "footless," no perfect specimen had been seen in Europe, the natives who sold the skins to coast traders invariably depriving them of feet and wings. The birds now usually included under this name belong to the family Paradisaeidae, closely allied to the crows. The largest is the great emerald bird (Paradisea apoda), about the size of the common jay. Its head and neck are covered with short thick-set feathers, resembling velvet pile, of a bright straw colour above, and a brilliant emerald green beneath. From under the shoulders on each side springs a dense tuft of golden-orange plumes, about 2 ft. in length, which the bird can raise at pleasure, so as to enclose the greater part of its body.
two centre tail feathers attain a length of 34 in., and, being desti-
tute of webs, have a thin wire-like appearance. This splendid
plumage, however, belongs only to the adult males, the females
being exceedingly plain birds of a nearly uniform dusky brown
colour, and possessing neither plumes nor lengthened tail feathers.
The young males at first resemble the females, and it is only
after the fourth moultling, according to A. R. Wallace, who has
studied those birds in their native haunts, that they assume
the perfect plumage of their sex, which, however, they retain
permanently afterwards, and not during the breeding season
only as was formerly supposed. At that season the males
assemble, in numbers varying from twelve to twenty, on certain
trees, and there disport themselves, so as to display their mag-
nificent plumes in presence of the females. Wallace in his
_Malay Archipelago, vol. ii., thus describes the attitude of the
male birds at one of those "sacaleli," or dancing parties, as the
natives call them: "their wings," he says, "are raised vertically
over the back, the head is bent down and stretched out, and the
long plumes are raised up and expanded till they form two
magnificent golden fans striped with deep red at the base, and
fading off into the pale brown tint of the finely-divided and
softly-waving points; the whole bird is then overshadowed by
them, the crouching body, yellow head, and emerald green
throat, forming but the foundation and setting to the golden glory
which waves above." It is at this season that those birds are
chiefly captured. The bird-catcher having found a tree thus selected
for a "dancing party," builds a hut among the lower branches in
which to conceal himself. As soon as
the male birds have begun their graceful antics, he shoots them,
and bringing them to the ground without drawing blood, which
would injure their plumage; and so eager are those birds in their
courtship that almost all the males are thus brought down
before the danger is perceived. The natives in preparing the
skins remove both feet and wings, so as to give more prominence to
the commercially valuable tuft of plumes. They also remove
the skull, and the skin is then dried in a smoky hut. The great
emerald bird, so far as yet known, is only found in the Aru
Islands. The lesser bird of paradise (Paradisina minor), though
smaller in size and somewhat less brilliant in plumage, in other
respects closely resembles the preceding species and is in some
more common, and much more widely distributed, being found
throughout New Guinea and the neighbouring islands. Its
plumes are those most generally used as ornaments for ladies' head-dresses. Both species are omnivorous, feeding voraciously
on fruits and insects. They are strong, active birds, and are
believed to be polygamous.

The king bird of paradise (Cicinnurus respublica) is one of the smallest and most brilliant of the
group, and is specially distinguished by its two middle tail
feathers, the ends of which alone are webbed, and coiled into a
beautiful spiral disk of a lovely emerald green. In the red
bird of paradise (Paradisaea rubra) the same feathers are greatly
elongated and destitute of webs, but differ from those in the other
species, in being flattened out like ribbons. They are only found
in the small island of Waigiu off the coast of New Guinea. In
the long-billed paradise birds the most remarkable is that known
as the "twelve-wired" (Seleucides albo), its delicate yellow
plumage, twelve of which are transformed into wire-like bristles
nearly a foot long, affording a striking contrast to the dark
metallic tints of the rest of its plumage.

**BIRDWOOD, SIR GEORGE CHRISTOPHER MOLESWORTH** (1832— ), Anglo-Indian official and writer, son of General
Christopher Birdwood, was born at Belgaum, in the Bombay
presidency, on the 8th of December 1832. He was educated at
Plymouth grammar-school and Edinburgh University, where
he took his M.D. degree. Entering the Bombay Medical
Service in 1854, he served in the Persian War of 1856-57, and
subsequently became professor at the Grant Medical College,
registrar of the university, curator of the museum, and sheriff
at Bombay, besides acting as secretary of the Asiatic and
Horticultural societies. His work on the _Economic Vegetable
Products of the Bombay Presidency_ reached its twelfth edition in
1868. He interested himself prominently also in the municipal
life of the city, where he acquired great influence and popularity.
He was obliged by ill-health in 1868 to return to England, where
he entered the revenue and statistics department of the India
Office (1871-1902). Whilst engaged there he published im-
portant volumes on the industrial arts of India, the ancient
records of the India Office, and the first letter-book of the East
India Company. He devoted much time and energy to the
encouragement of native literature, and on various aspects of what
he wrote valuable monographs, and his name was identified with
the representation of India at all the principal international
exhibitions from 1857 to 1901. (See _Journal of Indian Art_, vol.
_viii. "The Life and Work of Sir George Birdwood.") His
researches on the subject of incense (Trans. Linn. Soc. xxvii.,
1871; Ency. Brit. 9th ed. "Incense," 1881; revised for the
present edition by him), a good example of his mastery of
detail, have made his historical and botanical account of this
subject a classic. Nor can his lifelong association with journal-
ism of the best sort be overlooked. From boyhood he was a
diligent contributor of articles to the leading journals and
newspapers; in India he helped to convert the _Standard into
the Times of India_, and edited the Bombay _Saturday Review_;
and after his return to London he wrote for the _Pall Mall,
Atheneum, Academy, and Times_; and with Chenery, the editor of
_The Times_, and others he took the initiative (1882) in cele-
brating the anniversary of Lord Beaconsfield's death as "Prim-
rose Day" (April 19). He kept up his connexion with India
by constant contributions to the Indian press; and his long
friendships with Indian princes and the leading educated native
officials made his intimate knowledge of the country of particular
value in the handling of the problems of the Indian empire.
In 1887 he was created a K.C.I.E.; and, besides being given his
L.L.D. degree by Cambridge, he was also made an officer of the
Legion of Honour and a laureate of the French Academy.

**BIREJIK (Arab. Bir; classical, Apamea-Zeugma), a town of
North-West Mesopotamia, in the Aleppo vilayet, altitude 1776 ft.,
built on a limestone cliff 420 ft. high on the left bank of the
Euphrates. Pop. about 15,000, three-quarters Moslem. It is
situated at one of the most important crossings of the Euphrates,
where there was, in ancient times, a bridge of boats, and is now
a ferry and market place to Urfa, Hacchoura, and Mosul. Birejik corresponds actually to Apamea, which lay opposite
Zeugma, and commanded the bridge with its strong castle
(Kala Beda) now much ruined. The place seems to have had
a pre-Seleucid existence as Birliha, a name which revived under
Roman rule (we hear of the emperor Julian resting there on his
march into Mesopotamia, a.d. 363), and is preserved to this
day. The ferry over an unusually deep and narrow part of the
Euphrates has been used from time immemorial in the passage
from North Syria to Haran (Charraré), Edessa and North Mes-
opotamia, and was second in importance only to that to
Thaphaces, by which crossed the route to Babylon and South
Mesopotamia. Birejik was the scene of an unusually cruel
massacre and persecution of Armenians in 1895.

**BIREN (or BÜREN), ERNST JOHANN (1660-1772), duke of
Courland, was the grandson of a groom in the service of Duke
Jacob III. of Courland, who bestowed upon him a small estate, which Biren's father inherited and where Biren himself was born. He received what little education he had at the academy of Königsberg, from which he was expelled for riotous conduct. In 1714 he set out to seek his fortune in Russia, and unsuccessfully solicited a place at the shabby court of the princess Sophia Charlotte, the consort of the tsarevich Alexis. Returning to Mittau, he succeeded in gaining a footing at court there through the other of his sisters, who was the fancy of the ruling minister, Peter Bestuzhev, whose established mistress was no less a person than the young duchess Anne Ivanovna. During his patron's absence, Biren, a handsome, insinuating fellow, succeeded in supplanting him in the favour of Anne, and procuring the disgrace and banishment of Bestuzhev and his family. From henceforth to the end of her life Biren's influence over the duchess was paramount. On the elevation of Anne to the Russian throne in 1740, Biren, who had in the meantime married a Friedlein von Treiden, came to Moscow, and honours and offices were heaped upon him. At the coronation (10th May) he was made grand-chamberlain, a count of the empire, on which occasion he is said to have adopted the arms of the French ducal house of Biron, and was presented with an estate at Wendten with 50,000 crowns a year. He soon made himself cordially detested by Russians of every class. He was not indeed the monster of iniquity he is popularly supposed to have been. His vices were rather of the sordid than of the satanic order. He had insinuating manners and could himself very agreeable if he chose; but he was mean, treacherous, rapacious, and vindictive. After the death of his patron, Peter, of Anne's reign, Biren increased enormously in power and riches. His apartments in the palace adjoined those of the empress, and his livery, furnitures and equipages were scarcely less costly than hers. Half the bribes intended for the Russian court passed through his coffers. He had landed estates everywhere. A special department of state looked after his brood mares and stallions. The magnificence of his plate astonished the French ambassador, and the diamonds of his duchess were the envy of princes. The climax of this wondrous elevation was reached when, on the execution of the line of Kettler, the estates of Courland, in June 1737, elected him their reigning duke. He was almost as much loathed in Courland as in Russia; but the will of the empress was the law of the land, and large sums of money, smuggled into Courland in the shape of bills payable in Amsterdam to bearer, speedily convinced the electors. On her death-bed Anne, very unwillingly and only at his urgent entreaty, appointed him regent during the minority of the baby emperor, Ivan VI. Her common-sense told her that the only way she could save the man she loved from the vengeance of his enemies after her death was to facilitate in time his descent from his untenable position. Finally, on the 26th of October 1740, a so-called "positive declaration" signed by 104 dignitaries, in the name of the Russian nation, conferred the regency on Biren.

Biren's regency lasted exactly three weeks. At midnight of the 15th of November 1740 he was seized in his bedroom by his ancient rival, Field Marshal Münich. The commission appointed to try his case condemned him (11th of April 1741) to death by quartering, but this sentence was commuted by the clemency of the new regent, Anna Leopoldovna, the mother of Ivan VI., to banishment for life to Polin in Siberia. At once his vast property was confiscated, including his diamonds, worth £660,000. For twenty-two years the ex-regent disappeared from the high places of history. He re-emerges for a brief moment in 1762, when the philo-German Peter III. summoned him to court. He was now too old to be in any one's way, and that, no doubt, was the reason why Catherine II. re-established him (1763) in his duchy, which he bequeathed to his son Peter. Misfortune had chastened him, and the last years of his rule were just and even benevolent, if somewhat autocratic. He died at Mittau, his capital, on the 28th of December 1772.

See Robert Nisbet Bain, The Pupils of Peter the Great (London, 1897); Christoph Hermann von Mannstein, Memoirs (Eng. ed., London, 1856); Claudius Rondou, Diplomatic Dispatches from Russia (St Petersburg, 1889-1892). (R. N. B.)

BIRETTA (Ital. barretta, Med. Lat. biretum, birettum, dim. of birrus, "a hooded cloak"); from the Fr. form barrette is derived the Eng. "barret-cap"), a cap worn by the Catholic clergy. It is square and stiff, being made of a framework of cardboard covered with cloth or silk; on the top, along the sutures of the stuff are three or four raised, board-like, arched ridges, at the junction of which in the centre is a knob or tassel (floris). Its colour varies with the rank of the wearer, that of the pope being white, of the cardinals red, of bishops purple, and of the lower clergy black. It is not in the strictest sense a liturgical head-dress, its use not being confined to liturgical functions. In these functions, moreover, its use is strictly limited; e.g. it is worn at low masses by the priest only when he goes to and from the altar, at high masses also when the celebrant sits during the singing of the Kyrie, Gloria and Credo, and at processes when these take place outside the church and are not sacredental, and so on.

Though the form of the biretta, devised in the 17th century, is peculiar to the Roman Church, it is but a variant of the original biretum, which developed in various countries into head-coverings of different shapes and significance. At the outset there was little to distinguish the biretum from the pileus or pileolus (skull-cap), a non-liturgical cap worn by dignitaries of the Church under the mitre and even under the biretta. When the word biretum first appears in the 15th century, it practically means no more than "cap," and is used as a synonym of pileus. As an ecclesiastical head-dress the biretum, under the name of pileus, to the 12th century; under that of infusa, to the end of the 10th. It would seem to have been worn by the cantors as a protection against cold. The same utilitarian reason led to its introduction among the clergy generally. Thus in 1243 Pope Innocent IV. granted leave to the Benedictines of St. Augustine's at Canterbury, and to those of Winchester, to wear the pileus in choir. With the extension of its use, too, the custom grew up (c. 1300) of investing clerks with the biretum as the symbol of the transfer of a benefice, a custom which survives, in Roman Catholic countries, in the solemn delivery of the biretta by the head of the state to newly created cardinals, who afterwards go to Rome to receive the red hat. This red biretta is called the zucchetto.

This use of the biretum as a symbol of office or dignity was not confined to the clergy. With various modifications of form it was worn by all persons of standing, e.g. barons, judges, and doctors and masters of the universities. The biretum was also used in the investiture of laymen with office, e.g. a duke or the prefect of the city of Rome (Du Cange, Gloss. s. v. biretum). The "cap of maintenance" still bears before the English sovereign on state occasions is a barret-cap of the type of the 14th and 15th centuries; it symbolized the cherished feudal right of maintaining a personal armed following. By the 16th century the barret-cap had become the common head-gear of all people of substance, men and women. It was flat, square or round, sometimes with edges that could be turned up or down according to convenience, and was often elaborately decorated. By the 17th century it had given place in ordinary civil life to the brimmed hat; but in various shapes it still survives as official head-gear in many European countries: the Baret, worn in church by the Lutheran clergy, in the courts by German lawyers, and by the deans and rectors of the universities, the barrette of French judges and barristers, the "black cap" of the English judge, and the "college cap" familiar in English and American universities, and vulgarly known as the "mortar-board."

Meanwhile the ecclesiastical developments of the biretum are not without interest and significance. Originally this had been a round cap, low or moderately high, slightly bulging out at the top, and ornamented with a round knob. By the 16th century, both in England and on the continent, a tendency had begun to emphasize the ridge of the sutures and thus produce a square shape. Henceforth the evolution followed different lines. In England, in the 17th century, the square flat top began to be
enlarged, forming a rim of thick stuff projecting beyond the close-fitting cap. This was the "square cap" so virulently denounced by the Puritans as a symbol of High Church Erastianism. With the triumph of High Church principles at the Restoration it was natural that a loyal clergy should desire to emphasize this squareness, and the consequent exaggeration on the square top of the cap necessitated a further stiffening. In the 18th century, accordingly, the top began to be made of a board of wood or card covered with cloth, the close-fitting cap proper retired farther from the edges, the knob developed into a long tassel, and the evolution of the modern "college cap" was complete (see fig. 1).

On the continent, meanwhile, in the Roman Catholic Church, the biretum had also developed into its present characteristic form, and by a All who were professed monks or cistercians, in a certain number of the churches in the south of Italy, he was known as "the squareness," and the actual form of the biretum, as described above, had become fixed (see fig. 2). Only in Spain has the biretuta continued to be worn without the raised ridges.

The use of the Roman biretum has been introduced by a certain number of the clergy into the Anglican Church. It is clear that there is no historical justification for this; for, though both college cap and biretum are developed from the same "square cap," the biretum in its actual shape is strictly associated with the post-Reformation Roman Church, and its actual ceremonial use is of late growth. Braun (Liturgische Gewandung, p. 513) thinks that the symbolism of the cross may have had some influence in fixing and propagating the square shape, and he quotes a decree of the synod of Aix (1585) ordering the clergy to wear a biretum sewn in the form of a cross (biretum in modum crucis consuutum, ut ecclesiastici homines decreti soce). As far as the legality of the use of the biretum in the Church of England is concerned, this was pronounced by Sir R. Phillimore in the Court of Arches (Elphinston v. Purchas, 1870) to be legal "as a protection to the head when needed," but this decision was reversed on appeal by the judicial committee of the privy council (Hobart v. Purchas, 1871). Of late years the old square cap of soft padded cloth or velvet has been revived in the Anglican Church by some dignitaries.

See J. Braun, S.J., Die liturgische Gewandung (Freiburg-i-B., 1907); Liturgica Anglica, part ii. (London, 1903); H. Drueff, Costume on Brabant (London, 1866). (W. A. P.)

BIRGER (7–1266). Swedish statesman, nephew of Birger Bross, and the most famous member of the ancient noble family of the Folkungätten, which had so much to say for itself in early Swedish history, was created jarl of Bjällö by King Erik Eriksson in 1238 and married the king's sister. On Erik's death (1250) Birger's son Valdemar was elected king while his father acted as regent. During the sixteen years of his sway Swedes advanced greatly in fame and prosperity. In 1249 he led an expedition to Finland, built the fortress of Tavastehus, and thus laid the foundations of Sweden's overseas empire. He also built Stockholm, and enriched it by making it the chief mart for the trade of Lübeck, with which city he concluded a commercial treaty. As a lawyer also Birger laboured strenuously in the interests of civilization. In his old age he married the daughter of Knut Abel. There is a fine statue of the great jarl in the Riddarholm church at Stockholm, erected by Fogelberg at the expense of the Stockholm magistracy in 1684. He is also the central figure of Fr. Hedberg's drama Brörlöpet på Ulftasa (1865). See Steyring's Historia, vol. i. (Stockholm, 1879–1883).

BIRIBI, or CAVAGNOLE, a French game of chance, prohibited by law since 1857. It is played on a board on which the numbers 1 to 70 are marked. The players put their stakes on the numbers they wish to bet on. The banker is provided with a bag from which he draws a case containing a ticket, the tickets corresponding with the numbers on the board. The banker calls out the number, and the player who has backed it receives sixty-four times his stake; the other stakes go to the banker. In the French army "to be sent to Biribi" is a cant term for being sent to the disciplinary battalion in Algeria.

BIRJEND, the capital of Kāf, a sub-province of Khorasan in Persia, in 35° 52' N. 59° 10' E., and at an elevation of 1550 ft. It is situated 328 mi. from Meshed by the direct road, in a fertile valley running east and west, of which the southern boundary is a lofty range of barren hills known as Kuh i Bākerān. Through the valley runs the Khūsp river, which loses itself in the desert towards the west; it is, however, generally dry. The water-supply of the town and of the 70 or 80 villages under its jurisdiction is very scanty. On the east of the town at the foot of a hill stands a dilapidated fort. Birjend has six good caravanserais, a college and some mosques; post and telegraph offices were established there in 1902.

BIRKBECK, GEORGE (1776–1841), English physician and philanthropist, was born at Settle in Yorkshire on the 10th of January 1776. He early evinced a strong predilection for scientific pursuits; and in 1799, after graduating as doctor of medicine, he was appointed to the chair of natural philosophy at the Andersonian Institution of Glasgow. In the following year he delivered, for the benefit of the working-classes, a gratuitous course of scientific lectures, which were continued during the two following years and proved eminently successful. He removed to London in 1804, and there he endeavoured to prosecute his philanthropic schemes, at first without much success, but ultimately very successfully. In 1823 he contributed to found the Mechanics' Institute, the name of which was afterwards changed to Birkbeck Institution or College, in honour of its founder. He was appointed director of the institute, which he had originally endowed with the sum of £3500, and held the office till his death on the 1st of December 1841. The sphere of usefulness of the institution was gradually enlarged, and an enlargement of the buildings was carried out in 1883–1885. The college now holds day and evening classes in many of the sciences, in literature, languages and art.

BIRKENFELD, a medieval town, the capital of the principality of the same name, on the Zimmerbach, 25 m. S.E. of Trier and on the main line of railway from Bingerbrück to Neunkirchen. Pop. 2500. Close by, on an eminence, lie the ruins of the castle of Birkenfeld, dating from the 14th century, once the residence of the counts palatine of Zweibrücken. The town has an Evangelical and a Roman Catholic church, a grand-ducal high school and a hospital. Besides brewing and tanning, its industries include the manufacture of tobacco and chincory. There is also a considerable trade in cattle.
BIRKENHEAD, a municipal, county and parliamentary borough, and seaport of Cheshire, England, on the river Mersey, 195 m. N.W. of London. Pop. (1901) 116,975. It lies opposite Liverpool, on the east shore of the peninsula of Wirral, and is served by the Birkenhead (London & North-Western and Great Western joint) and the Wirral railways. It is wholly of modern growth, although the name of Byrkhead is traced to the forest which is believed to have extended between the mouths of the Dee and the Ribble in Lancashire. A Benedictine monastery was founded (c. 1150) by Hamon de Masye, third baron of Dunham Massey, and dedicated to St Mary and St James. It drew its main revenues from tolls levied at the Mersey ferry; and its prior sat in the parliament of the earls of Chester, enjoying all the dignities and privileges of a Palatinate baron. A fine crypt, along with remains of the prior's lodging, refectory and chapel, may still be viewed, as the priory was purchased by private subscription and handed over to the municipality in 1896.

The rise of Birkenhead, from a hamlet of some 50 inhabitants in 1818 to its present importance, was due in the first place to the foresight and enterprise of William Laird, who purchased in 1824 a few acres of land on the banks of a marshy stream, known as Wallasey Pool, which flowed into the Mersey about 2 m. west of the village. Among other engineers, Telford and Stephenson favoured the project of converting Wallasey Pool into a great basin for shipping; but, largely owing to the fears of Liverpool lest a formidable rival should thus be created, it was not until 1843 that parliamentary powers were obtained, and the work entrusted to James Rendel, who finished it in less than five years. The basin, which covered an area of 7 acres, were opened in 1847, and after thrice changing hands were made over in 1858 to the Mersey Docks and Harbour Board, a body created by act of 1857, to control the harbourage on both sides of the river.

Meanwhile, the town itself grew rapidly. In 1833 an act was passed for paving, watching, cleansing and improving the streets; as well as for the regulation of police, and the establishment of a market. The Improvement Commissioners constituted by this act included the mayor, bailiffs and four aldermen of Liverpool, under whose care the main streets were laid out on a regular plan, intersecting one another at right angles; and the first iron tramway in England was laid down. Electricity was subsequently applied to the tramway system. Noteworthy public buildings are St Aidan's College, a large brick building at Tudor style, for the use of Anglican students in theology; the market hall (1845); town hall, a free library with branches, borough hospital, built at the cost of Sir John Laird; and many schools both public and private, including the industrial schools built as a memorial to Albert, prince consort, at the cost of Sir W. Jackson, and the school of art, given by Sir John Laird. There are many handsome modern churches, all built since 1821. Rosary and Catholic Chapels are especially numerous, owing to the presence of a large Irish population.

The town is well furnished with open spaces. Birkenhead Park was opened in 1847, Mersey Park in 1853; while a tract of moorland 6 m. distant in the township of Thurstaston, was allotted to the borough of Birkenhead in 1887; and Meols Common, comprising over 50 acres of pastureland on the shores of Liverpool Bay, was made over to the corporation in 1900.

The increase of railway accommodation has been swift. In 1878 the old Monks Ferry station on the Great Western system was superseded by the opening of the Woodside passenger station, and a few years later the Birkenhead town station was opened. In 1886 the Mersey tunnel, connecting Birkenhead with Liverpool, was opened by the prince of Wales. The system extends from Rock Ferry and Park stations on the Cheshire side to the low-level at Central Station in Liverpool, and has connexions on the Cheshire side with the Great Western, North-Western, Wirral and various local lines. The Wrexham, Mold & Connah's Quay railway which was taken over by the Great Central company in 1905, helped to bring the mineral wealth of Flint and North Wales generally into the Birkenhead docks.

Woodside Ferry may still be regarded as the principal entrance to Birkenhead and the Wirral from Liverpool. The exclusive right of ferryage was granted to the priory in 1332. In 1842 the Birkenhead Commissioners purchased it, under an act of parliament, from the lord of the manor, Mr F. R. Price. In 1897 the corporation further acquired the rights over the Rock Ferry and the New Ferry at the southern end of the town.

Despite competition from the Mersey tunnel, these ferries continue to transport millions of passengers annually, and have a considerable share in the heavy goods traffic.

Although at the outset a mere commercial offshoot of Liverpool, Birkenhead has acquired a large export trade in coal and manufactured articles, importing guano, grain and cattle in return. Iron foundries, breweries, oil-cake and seed mills also exist side by side with such immense engineering and shipbuilding works as the Britannia Works, Canada Works, and, above all, Laird's shipbuilding works, where several iron vessels were built, and many cruisers and battleships have been launched. Huge warehouses and sheds have been erected along the quays for the storage of freight. In 1847 the Birkenhead Dock Warehousing Company opened its first warehouse, capable of holding 80,000 tons of goods. A line called the Dock Extension railway was carried round the whole, and the company erected, for their workmen, the Dock Cottages. This entire property is now under the authority of the Mersey Docks and Harbour Board.

The pile of buildings known as the corn warehouses are traversed by a canal which gives access to its several departments, and are provided with mechanical grain-elevators. There are also extensive lairages for live-stock, and cold storage for dead meat. On the north and north-east, and partly on the east, Birkenhead is bounded by its docks, which extend, for a distance exceeding 2 m., from the landing-stage at Woodside Ferry to the Wallasey Bridge. Of these the principal are the Egerton, Morpeth, Morpeth Branch and Wallasey Docks; while the Alfred Dock, with its three entrances, nineteen pairs of lock-gates, 8 acres of water, and 460 lin. yds. of quay-space, fulfils the part of an entrance-lock to the whole system. The great Float, now occupying the site of Wallasey Pool, separates Birkenhead from Poulton-cum-Seacombe in the parish of Wallasey. It forms an immense dock of 120 acres, with a quay-space of about 5 m.; and communicates on the E. with a low-water basin of about 14 acres and with the Alfred Dock; on the S.E. with the Morpeth, Morpeth Branch and Egerton Docks.

The Morpeth Dock (about 11 acres, quay-space 1290 lin. yds.) is in communication with the Morpeth Branch Dock (about 33 acres, quay-space 600 lin. yds.); both being set apart for the use of steamers. The total water-space of these docks amounts to 165 acres, and the linear quay-space is about 69 m. The entrances to the Birkenhead Docks are capable of docking the largest class of steamers afloat.

The massive iron bridges across the dock entrances are opened and closed by hydraulic power, which is likewise applied to the cranes, coal-hoists, warehouse-lifts and other machinery about the docks. At the extreme western end of the West Float are three large graving docks, two about 750 ft. in length, and 130 and 80 ft. respectively in width; while the largest measures about 900 ft. in length and 130 ft. in width.

In 1861 Birkenhead was created a parliamentary borough, returning one member. In 1877 it received a municipal charter, the boundaries of the borough including the suburban townships of Tranmere, Claughton, Oxton and part of Higher Bebington. The borough is under a mayor, 14 aldermen and 42 councillors. Area, 3848 acres.
BIRMINGHAM, a city and the county-seat of Jefferson county, Alabama, U.S.A., in the north-central part of the state, 96 m. N.W. of Montgomery, at an altitude of 600 ft. It is served by the Southern, the Louisville & Nashville, the Seaboard Air Line, the Central of Georgia, the Alabama Great Southern (of the Queen & Crescent Route), the Illinois Central, the Atlanta, Birmingham & Atlantic, the Birmingham Southern (for freight only), and the Kansas City, Memphis & Birmingham (Frisco system) railways. Pop. (1890) 26,178; (1900) 38,415, of whom 16,575 were of negro descent, and 17,76 were foreign-born; (1910) 132,685.

Birmingham is situated in Jones Valley, between two mountains which lie south-east and north-west of the city. Its streets are wide and well constructed, and there are gardens and parks in the southern part of the city. Birmingham, however, is famous for its manufacturing establishments and buildings. The city is the seat of the University of Birmingham, the Birmingham Medical College and the Birmingham Dental College; it has a school of art and a conservatory of music. The city contains a large number of factories, and is the centre of a large manufacturing district.

In the city, the most important educational institutions are the Birmingham Medical College and the Birmingham Dental College, with a school of art and a conservatory of music. There are also several private schools, including the Birmingham High School and the Birmingham Academy. The city is also the seat of the University of Birmingham, which is one of the largest and most important universities in the country.

Birmingham is a commercial centre, and is a large manufacturing and industrial city. It is the centre of a large manufacturing district, and is famous for its textile and metal industries. The city is also the seat of the University of Birmingham, which is one of the largest and most important universities in the country.

BIRMINGHAM, a city and a municipal, county, and parliamentary borough, the metropolis of one of the greatest industrial districts in England. Pop. (1901) 522,304. It lies in the north-west of Warwickshire, but its suburbs extend into Staffordshire on the north and into Worcestershire on the south. It is 113 m. north-west from London by the London & North-Western railway, lying on the loop line between Rugby and Stafford; it is also served by the northern line of the Great Western, and by the north and west (Derby-Bristol) line of the Midland railway.

Site.—Birmingham, built upon the New Red Sandstone, is situated in the valleys of the Rea and other small feeders of the river Tame, near their sources, and upon the rising ground between these valleys. The site is, therefore, boldly unhulating, rising from 200 to 300 ft. above sea-level, steadily towards the north and west, and the well-marked line of the Lickey hills skirts the site on the south-west, extending thence south-eastward. From the high ground to the south-east Birmingham thus presents the appearance of a vast semicircular amphitheatre, the masses of houses broken by innumerable factory-chimneys; the whole scene conveying a remarkable impression of a community of untried industrial activity. The area of the town is nearly 20 sq. m., the greatest length from north to south 7 m., and the greatest breadth about 4 m. Yet Birmingham is a fraction only of an industrial district, of which it forms the south-eastern extremity, which itself resembles one vast city, and embraces such famous manufacturing towns as Dudley, Wolverhampton, Walsall, Wednesbury and many others. This is the district commonly known as the “Black Country,” which forms part of the South Staffordshire industrial district. Birmingham, however, does not lie actually within the “Black Country” properly so-called.

Streets and Buildings.—The plan of the town, as dictated by the site, is irregular; the streets are mostly winding, and often somewhat narrow. In the centre are several fine thoroughfares, the most notable are the High Street, with nearly all these thoroughfares, Corporation Street and Colmore Row are the chief of these. At the western end of New Street is a fine group of buildings, including the council house and art gallery, the town hall and post office. The council house and art gallery, begun in 1874 and completed in 1888, is in Renaissance style, and the material is red sandstone, Spinkwell and Wrexham stone. The entrance is surmounted with a pediment filled with groups of excellent sculpture. The erection of that part which forms the art gallery was the work of the gas committee, to whom the council granted the sum of £100,000 towards it; they that would build such a gallery over their own office, the council having no powers at all to raise the required funds. The art gallery contains a fine collection of modern paintings, including masterpieces of David Cox, Millais, Hunt, Henry Moore, Albert Moore, Briton-Riviere and Burne-Jones. In the industrial hall are rich stores of Oriental metal work, Limoges enamel, English and foreign glass and Japanese ceramics. In the side galleries are various textiles, and Persian, Rhodian, Grès de Flandres and other pottery. There is a remarkable collection of Wedgwood. Notable also is the collection of arms, which is probably the most complete in the country. The purchase of pictures has been made from time to time by means of an art gallery purchase fund of £12,000, privately contributed and placed under the control of the corporation. Many valuable works of art are the gift of individuals. In 1896 plans were obtained for additional municipal offices and another art gallery on a site on the opposite side of Edmund Street from the council house. The town hall, completed in 1850, is severely classic, modelled upon a Greek temple. The lower stage consists of a plinth or basement, 23 ft. high, upon which is reared a façade of pedimental character, with eight Corinthian columns (36 ft. high) at the two principal fronts, and thirteen columns on each side. These columns (imitated from those of the temple of Jupiter Stator at Rome) support a bold and enriched cornice, finished at each end with a lofty pediment and entablature. The exterior of the hall is built of Anglesea marble. The interior consists chiefly of a regularly-built room,
BIRMINGHAM

designed specially for meetings and concerts, with an orchestra containing a fine organ. The hall seats upwards of 2000 persons, but when cleared of benches, as is the case at great political meetings, over 5000 may find standing room. The Midland Institute, adjacent to the town hall on the west, has a fine lecture theatre. To the south lie the post office, the inland revenue offices, Queen's College hall, the north is the Gothic building of Mason College, an institution merged in the university. The Central free library, adjoining the Midland Institute, was rebuilt in 1879, after a fire which destroyed the fine Shakespeare library, the Cervantes collection, and a large series of books on, and antiquities of, Warwickshire, known as the Stanmore collection. The Shakespeare series was as far as possible replaced, and the whole forms one of the largest reference and lending libraries in England. Edmund Street and Colmore Row are fine thoroughfares running parallel in a north-easterly direction from either side of the council house; in the first the principal building is the school of art, in the second are several noteworthy private buildings. Both terminate at Snow Hill station, that of the Great Western railway. New Street station, that of the London & North Western and Midland railways, lies close to the street of that name, fronted by the Queen's hotel. The station is nearly a quarter of a mile in length. The roof of the older portion consists of a vast arch of glass and iron, carried on pillars on each side, and measuring 1300 ft. in length, 80 ft. in height, and 212 ft. in width in a single span. The Royal Exchange New Street itself with a fine classic portico; here are also the exchange (Gothic) and the grammar school of King Edward VI, a Perpendicular building dating from 1540, designed by Sir Charles Barry. Corporation Street was the outcome of a great "Improvement scheme" initiated in 1875, with the object of clearing away a mass of insanitary property from the centre of the town and of constructing a main thoroughfare from the centre to the north-eastern outlet, starting from New Street, near the railway station to Bull Street, and thence continuing to the Aston Road. The scheme received parliamentary sanction in 1876, and was finished in 1882 at a cost of £2,500,000. This broad road is the almost total extinction of the residential quarter in the centre of the town. The finest building in this handsome street is the Victoria assize courts. The foundation stone was laid by Queen Victoria in 1857, after Birmingham had been created an assize district; the building was completed in 1861. There is a handsome entrance, and within is a great hall, 80 ft. by 40, with a series of stained-glass windows. The exterior is red, and highly ornamented in the style of the Renaissance.

Among other noteworthy buildings are the county court, erected by the county memorial committee. Among a fine series of statues and monuments may be mentioned the statue of Nelson by Richard Westmacott, in the Bull ring; those of Joseph Sturge, at the Five Ways, and of Thomas Attwood, the founder of the Political Union, in Stephenson Place, both by J. E. Thomas; James Watt, a singularly beautiful work, in Ratcliff Place, by Alexander Munro; Sir Robert Peel, in New Street, by Peter Hollins; Albert, prince consort, in the council house, by J. H. Foley; and Queen Victoria, by Thomas Woolner; Sir Rowland Hill, in the hall of the post office, by Matthew Noble; and the Prince of Wales, in New Street, by F. J. Williamson. There is also a fountain behind the Town Hall, commemorative of the mayoralty of Mr Joseph Chamberlain, and flanked by statues of Sir Josiah Mason, and George Dawson, who took active part in the municipal reform movement previous to Mr Chamberlain's years of office. Sir Francis Chantrey's famous statue of James Watt was in a special chapel at Handsworth church.

Suburbs.—The principal streets radiating from central Birmingham to the suburbs are served by electric tramways worked by the Birmingham and the Midland Railway, and also by motor omnibuses. The principal suburbs are as follows: Edgbaston, lying south-west of the centre of the city, being approached by Broad Street. These form a residential district principally inhabited by the richer classes, and owing to the enforcement of strict rules by the ground landlord, retain a remarkable semi-rural character, almost every house having a garden. Here, moreover, are Calthorpe Park, the botanical gardens, and the large private grounds attached to Edgbaston Hall, also the Warwickshire county cricket ground. To the south of Edgbaston, however, are the growing manufacturing districts of Selly Oak and Edgbaston, and south-east of these St. Martin's and King's Norton, in Worcestershire. The districts to the east of central Birmingham are Balsall Heath, Sparkbrook, Small Heath and Saltley. On the south-east is the residential suburb of Moseley, and on the east that of Yardley. Between Moseley and King's Heath to the south, is Highbury, the seat of Mr Joseph Chamberlain, whose active interest in the affairs of the town, both during his mayoralty (1873-1876) and at other times, was a principal factor in such works as the municipalization of the gas and water supply, the Corporation Street improvement, and the foundation of Birmingham University. On the east side the transition from the town to country is clearly marked. This, however, is not the case on the west side, where the borough of Smitheford adjoins Birmingham, and the roads through West Bromwich and towards Oldbury and Dudley have the character of continuous streets. On this side are Soho and Handsworth, which give name to a parliamentary division of Staffordshire. To the north lies Aston Manor, a municipal borough of itself, with Perry Bar beyond. To the north-east a populous district extends towards the town of Sutton Coldfield. Aston Hall is a fine Jacobean mansion standing in an extensive park. Aston Lower Grounds is an adjoining pleasure-ground. Besides these, the Cadburys, the Aston grounds the chief parks are Summerfields Park, towards Smitheford; Soho Park; Victoria Park, Handsworth; Adderley Park, towards Saltley; and Victoria Park, Small Heath. There is a race-course at Castle Bromwich, 3 m. east of the town.

Churches and Religion.—Birmingham is not rich in ecclesiastical architecture. It became a bishopric under the Bishops of Southwark and Birmingham Act 1904, including the arch-deaconry of Birmingham and the rural deanery of Handssworth, previously in the diocese of Worcester. Before 1721 it was in the diocese of Lichfield. There were formerly a religious house, the priory of St Thomas the Apostle, and a Gild of the Holy Cross, an association partly religious and partly charitable, having a chantry in the parish church. The possessions of the priory went to the crown at the dissolution, and the building was destroyed before the close of the 16th century. The lands of the Gild of the Holy Cross were granted by Edward VI to trustees for the support of the free grammar school. Until 1713 there was but one parish church, St Martin's, a rectorcy, having the reversion of the vicarage. St Martin's was erected about the middle of the 13th century, but in the course of ages was so disfigured, internally and externally, as to present no traces, except in the tower and spire, of its former character. In 1835 the tower was found to be in a dangerous condition, and together with the spire was rebuilt. In 1873 the remaining part of the old church was removed without disturbing the monuments, and a larger edifice was erected in its place. St. Philip's, a stately Italian structure, designed by Archer, a pupil of Wren, was the next church erected. It was consecrated in 1737, enlarged in 1884, and became the pro-cathedral on the foundation of the diocese. It contains a rich series of stained-glass windows by Burne-Jones. Then followed St Bartholomew's in 1749, St Mary's in 1774, St Paul's in 1790, St James's, Ashfield, in 1791, and others. St Alban's is a good example of J. L. Pearson's work, and Edgbaston church is a picturesque Perpendicular structure.

Under the Commonwealth Birmingham was a stronghold of Puritanism. Clarendon speaks of it and the neighbourhood as "the most eminently corrupted of any in England." Baxter, on the other hand, commending the garrison of Coventry, says it contained "the most rebellious men of the parts round about, especially from Birmingham." The traditional reputation for Nonconformity is maintained by the town, all varieties of dissenters being numerous and influential. The Unitarians, the
BIRMINGHAM

985

oldest body established here, have among their chapels a hand-some structure in Bristol Road, the Old Meeting, which in 1885 replaced the building in which the congregation was formed on the Presbyterian model by a number of ministers ejected under the Act of Uniformity. Another chapel, the New Meeting, in Moor Street, is memorable as having been the place of Dr Joseph Priestley's ministerial labours from 1780 onwards. In 1866 the Unitarians removed from this place to a new Gothic building called the church of the Messiah, in Broad Street, where they preserve a monument of Priestley, with a medallion portrait in profile, and an inscription written by Priestley's friend, Dr Parr. The first meeting-house of the Society of Friends dates from about 1690. Among Independent chapels, that of Carr's Lane had John Angell James and Robert William Dale as ministers. The Baptists first erected a chapel in Cannon Street in 1738. The Wesleyan Methodists were established in Birmingham by John Wesley himself in 1745, when he was roughly handled while preaching on Gos Green. In 1903 a very fine central hall, with lofty tower, was opened by this body, in the style of the Renaissance, fronting upon Corporation, Ryder and Dalton streets. The Presbyterians have also places of worship, and the Jews have a synagogue. From the revolution of 1688 until 1789 the Roman Catholics had no place of worship here; but Birmingham is now a Roman Catholic bishopric. The cathedral of St Chad was built from the designs of A. W. Pugin. At Erdington, towards Sutton Coldfield, is a large Benedictine Abbey (1867) of the Beuron congregation, founded as a monastery in 1856; and in the vicinity, at Oscott, is St Mary's College, where the chapel is a fine example of Pugin's work. Cardinal Newman was superior of the Oratory of St Philip Neri from its foundation in 1851.

Administration. — The government of the town resided originally in the high and low bailiffs, both officers chosen at the court of the lord of the manor, and acting as his deputies. The system was a loose one, but by degrees it became somewhat organized, and crown writs were addressed to the bailiffs. In 1382, when the town was enfranchised, they were made the returning officers. About the beginning of the 19th century, however, a more regular system was instituted, by an act creating a body of street commissioners, who acted for the parish of Birmingham, the hamlets outside its boundaries having similar boards of their own. The annoyance and difficulty caused by these bodies, thirteen in number, led to a demand for the incorporation of Birmingham as a borough; and a charter was accordingly granted by the crown in 1838, vesting the general government in a mayor, sixteen aldermen and forty-seven councillors. The powers of this body were, however, unusually restricted, the other local governing bodies remaining in existence. It was not until 1851 that an act of parliament was obtained, altering the system and altering the corporation and transferring all powers to this body. Another local act was obtained in 1862, and in 1883 these various acts were combined into the Birmingham Corporation Consolidation Act. In 1889 Birmingham was created a city, and a grant made of an official coat of arms carrying supporters. The title of lord mayor was conferred on the chief magistrate in 1897. The city council consists of eighteen aldermen and fifty-four councillors, selected from eighteen wards; it is divided into seventeen committees, most of which consist of eight members. The corporation is the largest employer of labour in the borough, and is also a large landowner.

The gas, electric and water supplies are in its hands. The gas supply was taken over in 1875, and the electric in 1900 for £200,000. The local sources of water-supply are the rivers Bourne and Blythe, the Plant Brook and the Perry Stream, and eight deep wells. These works can provide 20 million gallons daily in dry weather. A large area outside the city boundaries is supplied, and in 1891, the demand having risen to nearly 17 millions a day, new sources had to be considered, and it was determined to seek an entirely new supply in Wales. By an act of 1892 power was given to acquire the water rights of the rivers Elyn and Claerwen, tributaries of the Wye, lying west of Ryhader in Wales, and to construct the necessary works, the capital authorized being £6,000,000. About £5,000,000 had been spent when, on the 21st of July 1904, King Edward VII. formally opened the supply. Two reservoirs on the river Elyn, formed by masonry dams from 98 to 128 ft. above the river-bed, were then completed, the construction of the three planned on the Claer-wen being deferred until necessity should arise. Nearly a mile below the confluence of the rivers the great Caban Coch dam, 122 ft. high, and the same in thickness at the base, and 600 ft. long at the top, holds up the water for over 2 m. In the Elyn, and over 2 in the Claerwen, having a capacity of 1500 million gallons. A series of thirty filter beds is included in the original scheme; and the water travels 73-3 m. from the source to Birmingham by gravity alone with a fall of about 170 ft. The area of the gathering ground is 45,652 acres, the mean annual rainfall in the district being 63 in. The complete scheme provided water for fifty years in advance, and a maximum of 75 million gallons a day was taken into account, in addition to 27 million gallons for compensation water to the river. The part of the works opened in 1903, provided about 27 million gallons of supply daily to the city. The corporation is obliged by the act to supply towns within 15 m. of the line of the aqueduct. A village for the accommodation of workmen was established near the Caban Coch dam; and the corporation adopted a modified form of the Gothenburg system in respect of the supply of intoxicating liquors, permitting no publican to open a licensed house.

The administration of the poor-law is vested in a board of guardians of sixty members for the parish of Birmingham. The parish of Edgbaston (wholly within the borough) is in the poor-law union of King's Norton, and that part of the parish of Aston included in the borough is in the Aston Union. There are three workhouses—that for Birmingham parish, situated at Birmingham Heath, is capable of receiving over 2000 inmates. In 1882 a superintendent relieving officer was appointed, and a system of cross-visitation started for the purpose of checking abuses of outdoor relief. Workhouses, infirmaries and cottage homes are managed by the board, on which women first sat in 1886. The administration of justice was performed from 1838 to 1884 by a court of quarter sessions, with a recorder, and a court of petty sessions. In 1884 Birmingham was made an assize district of Warwickshire. In 1905 a special juvenile offenders' court was initiated. The borough gaol is at Winson Green towards Smethwick. The drainage system is managed by the Birmingham, Tame and Rea District drainage board, constituted in 1877, and consisting of members from the city council and from districts outside the municipal area.

Birmingham was enfranchised in 1832, when two representatives were assigned to it, and Thomas Attwood and Joshua Scholefield, leaders of the Political Union, were elected. In 1867 the vote was extended to females, and by a subsequent act the number was increased to seven, and a corresponding number of parliamentary divisions created, namely Bordesley, Central, East, Edgbaston, North, South and West. By the Provincial Local Government Board Act of 1891 four local board districts were added to the city of Birmingham for local government—Harborne (Staffordshire), Balsall Heath (Worcestershire), Saltley and the rural hamlet of Little Bromwich (Warwickshire). These districts were by the act declared to be in the county of Warwick, though still remaining in their respective counties for the exercise of freehold votes. By this act the boundaries of the city were made conterminous for parliamentary, municipal and school board purposes. The area is 12,630 acres.

The population of Birmingham in 1700 was about 15,000. In 1801 it was 73,000, and it increased rapidly through the century. In 1891 it was 278,113, and in 1901, 522,204.

Education. — The oldest educational institution is the grammar school of King Edward VI., founded in 1552 out of the lands of the Gild of the Holy Cross, then of the annual value of £21. The endowments now yield upwards of £57,000. The principal school included in the foundation is the boys' high school, held in the building in New Street. It has a classical and a modern side, and educates about 500 boys. Adjoining it, in a new building opened in 1896, is a large high school for girls, with 300
pupils. There are also on the foundation seven middle schools, called grammar schools, four for girls and three for boys, situated in different parts of the city, and containing about 1000 pupils altogether. The schools have numerous scholarships tenable at the schools as well as exhibitions to the universities and other places of higher education. Queen’s College, founded in 1828 as a school of medicine, subsequently embraced other subjects, though in 1882 only the medical and theological departments were maintained. In 1882 a large part of the scientific teaching, hitherto done by professional and unaccredited teachers, was transferred to the created University of Birmingham. In 1882 the whole medical department was removed to the same institution under an order from the court of chancery. This change helped to advance the Birmingham medical school to a position of high repute. The theological students (Christ Church of England) of Queen’s College are few. The idea of developing Queen’s College into a university had long existed. But it was destined to be realized in connexion with Mason College, founded by Sir Josiah Mason in 1870. Subsequent deeds (1874 and 1881) added Greek and Latin to the practical, mechanical and artistic curriculum of the university. The fund provided that instructions may be given in all such other subjects as the trustees may from time to time judge necessary, while once in every fifteen years the provisions of the deed may be varied to meet changing needs—theology only being definitely excluded. In 1897 a new act was passed at the instance of the trustees, creating a court of 150 members, and removing the theological restriction. A measure of popular control is given through the appointment by the city council of five out of the eleven trustees. In 1898 a public meeting carried a resolution in favour of creating a university. It was estimated that a quarter of a million was needed to endow and equip a university on the scale proposed. Including £50,000 offered by Mr Andrew Carnegie, an equal amount from an anonymous donor, and the rest from local subscribers, in the autumn of 1899, £125,000 had been subscribed, and the privy council was at once petitioned for a charter, which was granted. The draft provided for the incorporation of the university of Birmingham with faculties of science, arts, medicine and commerce, with power to grant degrees, and for its government by a court of governors (of which women may be members), a council and a senate. Mason College was merged in the universi- ty. The faculty of art hitherto held in the building, the industrial department was greatly enlarged, resulting in the creation of one of the best metallurgical schools in the kingdom. The Municipal Technical School was established in 1863 in the building of the Midland Institute, and in 1895 was housed in a fine building of its own, in Suffolk Street, whither the whole of the scientific teaching of the institute was transferred. It contains metallurgical and engineering workshops and laboratories, lecture theatres for the teaching of chemistry and physics, a women’s department, and rooms for the teaching of machine drawing and building con- struction. Among other educational foundations may be mentioned a number of industrial schools, reformatory and private schools of a good class.

The principal libraries are the Birmingham library, founded in 1798 by Dr Priestley, in a modern building, the Central free library, and other free libraries in different parts of the city, each with a lending department and a reading room. Charities.—The general hospital, the foundation of Dr Ash, an eminent local physician, was opened in 1779. The old corporation charity was replaced by a splendid new one in St Mary’s Square, costing £306,000. The Queen’s hospital, Bath Row, the other large hospital of the town, was founded in 1840 by W. Sands Cox, F.R.S., an eminent local surgeon, who also founded the Queen’s College as a medical school. The General dispensary, the officers of which visit patients at their own homes, relieves about 8000 yearly. The children’s hospital (free) established in 1864 by Dr Heslop, has two establishments—for out- patients (a handsome Gothic building) in Steelhouse Lane, and an in-patient department in Broad Street. There is also a women’s hospital (free) for the special disease of women; a lunatic asylum for the county; and the West End Sanatorium for consumption, in Fryer’s Lane, an establishment founded in 1885 by Mr Lawrence, F.R.C.S. Asylums, for the modern dispensary in Paradise Street. The majority of the hospitals and dispensaries are free. Nearly all these medical charities depend upon subscriptions, donations, legacies and income from invested property. There are two public organizations for aiding the charities, both of which were begun in Birmingham. One is a simultaneous collection in October in churches and chapels, on the Sunday called Hospital Sunday, established in 1881; the other is the Saturday Hospital collection, made by the workpeople in March, which was established in 1873. A musical festival is held triennially in aid of the general hospital. There is a sanatorium at Blackwell, near the Lickey Hill, 10 m. south of Birmingham, common to all the hospitals. Amongst the non-medical charities the principal are the blind institution and the deaf and dumb asylum, both at Edgbaston; and Sir Josiah Mason’s orphanage at Erdington. There are also in the town numerous almshouses for aged persons, the chief of which are Lench’s Trust, the James Charities, and the Licensed Victuallers’ almshouse for distillers of spirits; others such as the Oddfellows’, Foresters’, &c., which are strongly supported in Birmingham, the workpeople have numerous clubs of a charitable kind, and there are several important local provident societies of a general character, with many thousand members.

Commerce.—From an early period Birmingham has been a seat of manufactures in metal. Hutton, the historian of the town, claims for it Saxo or even British antiquity in this respect, but without foundation. The first direct mention of Birmingham trades is to be found in Leland’s Itinerary (1548). He writes:—

“I came through a pretty street as ever I entered into Birming- ham town. This street, as I remember, is called Dirtey [Deritend]. In it dwell smiths and cutters. There be many smithies in the town whose trade to make knives and all manner of cutlery tooles, and many lorimiers that make bitteres, and a great many naylers, so that a great part of the town is main- tained by smithies, who have their iron and sea-cole out of Staffordshire.” The cutters no longer exist, this trade having gone to Sheffield; but the smiths remain, and the heavier cutting tools are still largely made here. The wide importance of Birmingham as a centre of manufactures began to decline at the close of the 17th century, one great source of it being the absolute freedom of the town, there being no gilds, companies or restric- tions of any kind; besides which the easy access to cheap coal and iron indirectly helped the development. It is remarkable that two important trades, now located elsewhere, were first established here. Steel was made in Birmingham until 1797, but then ceased to be so for about seventy years, when an experiment in steel-making was made by a single firm. Cotton-spinning was begun in Birmingham by John Wyatt, Lewis Paul and Thomas Warren as early as 1730; but the speculation was
BIRMINGHAM

987

abandoned before the end of the century. The great staple of Birmingham is metal-working in all its various forms. The chief variety is the brass-working trade. Iron-working, though largely carried on, is a much less important trade, works of this kind being chiefly established in the Staffordshire district. Jewelry, gold, silver and gilt come next to brass. The remarkable development of this branch of industry is demonstrated by the increase in the amount of gold and silver marked, as recorded by the Assay office—the figures of 4,812,3 oz. of gold and 8,523 oz. of silver in 1870 had been increased to 363,000 oz. of gold and nearly 3,000,000 oz. of silver by the end of the century. Then follow "small arms" of all kinds. Until 1906 a Royal Small Arms factory was maintained by the government at Sparkbrook, but it was then transferred to the Birmingham Small Arms Company, which had already extensive works in the district. Buttons, hooks and eyes, pins and other articles used for dress, constitute a large class of manufactures. Glass, especially table glass, is a renowned staple of the town. Crowns, nails, &c., are made in enormous quantities; indeed, Birmingham has a monopoly of the English screw trade. Steel pens are also a specialty, the name best known in this connexion being that of Sir Joseph Mason. Electro-plating, first established in 1841 by the firm of Elkington, is one of the leading trades. Among other branches of manufacture are wire-drawing, bell founding, metal rolling, railway-carriage building (a large and important industry), the manufacture of cutting implements and tools of all kinds, die-sinking, paper-maché making and a variety of other trades. Birmingham is a centre of the manufacture of stamps, by which this art is carried on in a modern and systematic way. A factory was established in 1829, where 500,000 stamps were made annually. The factory, followed in 1839 by an almost equally sudden collapse, but this industry is maintained and accompanied by the manufacture of motor cars, tyres and accessories, for which Birmingham is one of the principal centres in Great Britain.

Birmingham may claim as her own the perfection of the steam engine, through the genius of James Watt and the courage of Matthew Boulton. The memory of the great Soho factory is one of the most precious heritages of the town, and Watt's own private workshop continues just as he left it, with no single article disturbed, carefully preserved in the garret of his house at Heathfield. The name of Watt and of Soho is linked with the memories of distinguished inventors and others who have been connected with Birmingham. Here John Baskerville, the printer, carried on his work. An institution called the Lunar Society, which met each month about the time of full moon, brought together a brilliant company—Watt, Boulton, Joseph Priestley, Josiah Wedgwood, Erasmus Darwin, Samuel Parr, Dr William Withering, Richard Lovell Edgeworth, Sir Joseph Banks, Sir William Herschel, Dr Solander, John Roebuck, James Keir and many others. William Murdock, the inventor of gas, was a Soho man, and first used his invention to light the Soho factory at the peace of Amiens in 1802. The series of inventors is continued by the names of Gillott, Elkington, Chance, Mason and others. Thomas Rickman, the reviver and historian of Gothic architecture, practised as an architect in Birmingham. William Hutton, the antiquary and historian, carried on his bookselling business here. Many of the best engravers were Birmingham men, notably James Tittibits Willmore and John Pye, the special translators of Turner's marvellous creations. Atwood, Joseph Parkes, John Bright and Joseph Chamberlain speak for Birmingham in the region of politics and statesmanship.

One of the most marked features of social life in Birmingham is the fact that contrasts in the distribution of wealth are less strongly marked than in most other great cities. The distance between the poorest and the richest is bridged over by a larger number of intermediate gradations. Colossal fortunes are few; on the other hand there is a numerous class of rich men. These, however, for the greater part are actually engaged in trade or manufactures, and hold their place in local life rather on account of industry pursued than of wealth possessed. The number of the leisure class, enjoying large incomes without participating in any local industry, is relatively small, but is said to be on the increase. There are many manufacturing companies, but great private firms are also numerous. In regard to labour conditions, the system of small masters holds its own in the manufactures of Birmingham, and shows no signs of extinction. One effect of this condition is that capital and labour are not brought into enmity, and consequently strikes and disputes are infrequent. As regards the condition of the working classes it may be noted that Birmingham was the birthplace of the freehold land and building societies, by which workmen are enabled to own houses free from mortgage. The risk of an overcrowded population is consequently minimized; the houses, moreover, are generally well situated as regards light and air, and many have small gardens. Among industrial communities where peculiar attention is paid to the housing of workmen and their families, that of Bournville, occupied by the employers of Messrs Cadbury, chocolate manufacturers, is well known.

History.—Owing to its rapid expansion, and the consequent newness of most of the public and other buildings, Birmingham is often supposed to be a modern town. It was, however, in existence as a community in the Saxon period. Proof of this was given in 1309 by William de Birmingham, then lord of the manor, who showed in a law-suit that his ancestors had a market in the place and levied tolls before the Conquest. Some authors have endeavoured to identify the town with the supposed Roman station called Bremenium, but this claim has long been abandoned as fabulous. A Roman road runs north and south across the site of the town, but no remains have been found other than a very few coins. The origin of the name is untraceable; the spelling itself has passed through about 100 different forms. Dugdale, the historian of Warwickshire, adopts Bromwicham, which is said to be a corruption of "Bromwichham," the name of a hamlet or "village" near the town, and in which Birmingham, has the fanciful etymology of Brom (broom), wych (a descent), and ham (a home), making together the home on the hill by the heath.

In Domesday Book Birmingham is rated at four miles of land with half a mile of woods, the whole valued at £203. Two hundred years later the family of de Birmingham, the owners of the place, came into sight, one of them, William, being killed at the battle of Evesham, in 1265, fighting with Simon de Montfort and the barons against Henry III. The son of this William afterwards took part in the French war, and was made prisoner; his father's estates, forfeited by treason, were restored to him. Henceforward the family engaged in various local and other offices, but seemingly abstained from politics. They held the place until 1527, when Edward de Birmingham was deprived of his property by means of John Dudley, duke of Northumberland, who trumped up a pretended charge of riot and robbery against him and procured Birmingham for himself. On the attainder of Dudley the manor passed to the crown, and was granted to Thomas Marrow, of Berkswell, from whom by marriage and descent it went to Christopher Musgrave, and finally, as regards the only valuable part—the market tolls, to purchase the town itself. In the Wars of the Roses it does not seem that Birmingham took any part; but energy revived in the Civil War under Charles I., when the town sided actively with the Parliamentarians. In 1642, when Charles was marching from Shrewsbury to relieve Banbury, the Birmingham people seized part of his baggage, including much plate, money and wine, which they sent to the Parliamentary garrison at Warwick. Before the battle of Edgehill Charles rested for two nights at Aston Hall, near the town, as the guest of Sir Thomas Holte. The Birmingham people courted this by helping the Parliamentarians to capture the Hall and to levy a fine upon Sir Thomas Holte. They also supplied the Parliamentary army with 15,000 sword blades, refusing to make a single blade for the Royalists. These manifestations of hostility were avenged in April 1643 by Prince Rupert, who, with 2000 men and several pieces of artillery, attacked the town, planting his cannon on an eminence near Sparkbrook, still known as Camp Hill. The townspeople resisted, but were beaten, many persons being killed or wounded. Amongst the former was Lord Denbigh, one of the Royalist officers. Having captured the place, Prince Rupert allowed his troops to plunder it, to burn about eighty houses and to set their prisoners to ransom. He also levied a fine of £10,000,
equal to at least £100,000 of the present value of money. This bitter lesson kept Birmingham quiet during the rest of the Civil War, though the sympathies of the people with the Parliamentarians were unabated. In 1665 Birmingham suffered heavy losses by the plague, great numbers of dead being buried in the Pest Field, at Ladywood, then a lonely place far outside the town, but long since sweetheart station, which was turned into the town in 1677. The destruction provoked a temporary outbreak of Protestant feeling. James II. had given timber from the royal forest of Needwood, near Burton, to build a Roman Catholic chapel and convent in a place still called Mass-house Lane. This edifice the mob promptly destroyed when James gave place to William and Mary. Rather more than a century of quiet prosperity ensued, and then occurred the serious and most lamentable outbreak of popular fury known as the Church and King riots of 1791. For some years there had been much political activity in Birmingham, the dissenters, particularly the Unitarians, long desirous of relief from the political and religious disabilities under which they laboured. The leader in these movements was the famous Dr Priestley, who kept up an active controversy with the local clergy and others, and thus drew upon himself and his co-religionists the hatred of the more violent members of the Church and Tory party. The smouldering fire broke out on the occasion of the French Revolution. On the 14th of July a dinner of Birmingham Liberals was held at the Royal Hotel to celebrate the destruction of the Bastille. This was the signal of a popular outbreak. A Church and King mob, encouraged and organized by Birmingham gentry, who in cowardly fashion showed themselves, began an attack upon the Unitarians. Priestley was not present at the dinner, but his house at Fair Hill, Sparkbrook, was one of the first to be sacked and burnt—his library and laboratory, with all his manuscripts, the records of life-long scientific and philosophical inquiries, perishing in the flames. The house and library of Hutton the historian were also destroyed. The Unitarian chapel was burnt, and several houses belonging to members of the sect were sacked and burnt. The riot continued until a strong body of troops was marched into the town, but before their arrival damage to the amount of more than £50,000 had been done. Some of the rioters perished in the burning buildings, in the cellars of which they drank themselves into stupefaction. Others were tried and imprisoned, and four of the prisoners were hanged. The persecuted Unitarians recovered a small part of their losses from the county; but Priestley himself, owing in a great measure to the unworthy prejudice against him, was forced to remove to the United States of America, where he spent the rest of his life. A late atonement was made by the town to his memory in 1873, by the erection of a statue in his honour in front of the town hall and the founding of a Priestley scholarship at the Midland Institute.

As if ashamed of the excesses of 1791, Birmingham thenceforth became, with one or two exceptions, a peaceful town. In the dismal period from 1817 to 1819, when the manufacturing districts were heavily distressed and were disturbed by riots, Birmingham remained quiet. Even when some of the inhabitants were tried and punished for demanding parliamentary representation, and for electing Sir Charles Worsley as their delegate, there was no demonstration of violence—the wise counsels of the leaders inducing orderly submission to the law. The same procedure was observed when in the Reform agitation of 1831-1832 the Political Union was formed, under the leadership of Thomas Attwood, to promote the passing of the Reform Bill. Almost the whole town, and great part of the surrounding district, joined in this agitation; vast meetings were held on Newhall Hill; there was much talk of marching upon London 100,000 strong; but, owing to the firmness and statesmanship of Attwood and his associates, there was no rioting or any sign of violence. Ultimately the Political Union succeeded in its object, and Birmingham helped to secure for the nation the enfranchisement of the middle-class of the people and the political reform. One exception to the tranquility of the town has to be recorded—the occurrence of riots in 1839, during the Chartist agitation. Chartism took a strong hold in Birmingham, and, under the influence of Feargus O'Connor and some of his associates, nightly meetings of a threatening character were held in the Bull Ring. The magistrates resolved to put these down, and having obtained the help of a detachment of the metropolitan police—the town then having no local police force—a meeting was dispersed, and a riot ensued, which resulted in injury to several persons and property, and finally resulted in the town beingbaumed, and the 4th of July. On the 15th of the same month another meeting took place, and the mob, strongly armed and numbering many thousands, set fire to several houses in the Bull Ring, some of which were burned to the ground and others were greatly damaged. The military again interfered, and order was restored, several of the ringleaders being afterwards tried and imprisoned for their share in the disturbance. There was another riot in 1867, caused by the ferocious attacks of a lecturer named Murphy upon the Roman Catholics, which led to the sacking of a street chiefly inhabited by Irishmen; but this incident was comparatively trivial and further disorders were prevented by the prompt action of the authorities.

BIRNEY, JAMES GILLESPIE (1792-1857), American reformer, leader of the conservative abolitionists in the United States from about 1835 to 1845, was born in Danville, Kentucky, of a family of French Huguenot descent. He was educated in a school near Cincinnati, and graduated at the College of New Jersey (now Princeton University) in 1810. In 1814, after a course of legal study, he began the practice of the law at Danville. He entered immediately, as a Democrat, into Kentucky politics, and political ambition caused his removal in 1818 to northern Alabama, near Huntsville. There was at that time in the south-west much anti-slavery sentiment. Birney's father was among those who advocated a "free state" constitution for Kentucky, and the home environment of the boy had thus fostered a questioning attitude towards slavery, though later he was himself a slave-holder. In the general assembly of Kentucky in 1816, and in that of Alabama in 1819, he opposed inter-state rendition of fugitive slaves and championed liberal slave-laws. His career as a lawyer in Alabama was exceptionally brilliant; but his political career was abruptly wrecked by his opposition in 1819 to Andrew Jackson, whose friends controlled the state. His tariff and anti-slavery views, moreover, carried him more and more away from the Democratic party and toward the Whigs.

About 1826 he began to show an active interest in the American Colonization Society, and in 1832-1833 served as its agent in the United States. In 1834 his public opinions brought him into conflict with the convention of the American Anti-Slavery Society; and it was in that year, by the formation of the Anti-Slavery Society at Danville (1835). For this he was ostracized from Kentucky society; his anti-slavery journals were withheld in the mails; he could not secure a public hall or a printer. In these circumstances, he removed to Cincinnati, Ohio, and there, in January 1836, founded the Philanthropist, which, in spite of rancorous opposition, became of great influence in the north-west. Birney soon relinquished its active control in order to serve the Anti-Slavery Society as secretary and as a lecturer. He favoured immediatism, but he differed sharply from the Garrisonian abolitionists, who abhorred the federal Constitution and feared to associate with the party. He always wore black clothes and laboured for the permanent safety of the Union. The assaults of the South in defence of slavery upon free speech, free press, the right of petition and trial by jury, he pronounced...
BIRON—BIRRELL

989

"exorbitant claims . . . on the liberties of the free states"; the contest had become, he said, "one not alone of freedom for the blacks but of freedom for the whites." Twenty-three years before, William H. Seward characterized it as an "irresistible conflict" the antagonism between freedom and slavery. Biron proclaimed: "There will be no cessation of conflict until slavery shall be exterminated or liberty destroyed"—"liberty and slavery cannot both live in juxtaposition" (1835). The ends being political, so also, thought Biron, must be the means; as parties in the south were fusing, he laboured to re-align parties in the north, and advocated the formation of an independent anti-slavery party. After the separation of the Garrisonian and the political abolitionists in 1840 the new party was formed, and in 1840, and again in 1844, as the Liberty party (q.v.), it made Biron its candidate for the presidency. In 1850 he received 7009 votes; in 1844, 62,636. A fall from his horse in 1845 made him a hopeless invalid, and completely removed him from public life. He died at Perth Amboy, New Jersey, on the 25th of November 1857.

Two of Biron's sons, William Birney (1810-1897) and David Bell Birney (1825-1864), were prominent as officers on the Federal side during the Civil War in America.

His Titles and Works (1890), by his son, William Birney; and his principal writings: On the Sin of Holding Slaves (1834). Letter on Colonization (1834). Vindication of Abolitionists (1835), American Churches the Bulwark of American Slavery (1846); An Address to the black people of America (1851); Letters to Parliament (1851); Speeches in England (1840); and Case of Strader et al. (1848).

BIRON, ARMAND DE GONTAUT, BARON DE (1524-1592), a celebrated French soldier of the 16th century. His family, one of the numerous branches of the house of Gontaut, took its title from the territory of Biron in Périgord, where on a hill between the Dropt and the Lide still stands the magnificent castle begun by the lords of Biron in the 12th century. As a page of the queen of Navarre Burgundy was informed of the notice of the marshal de Brissac, with whom he saw active service in Italy. A wound received by him in his early years made him lame for life, but he did not withdraw from the military career, and he held a command in Guise's regiment of light horse in 1557. A little later he became chief of a cavalry regiment, and in the wars of religion he repeatedly distinguished himself.

His great services to the royal cause at Dreux, St Denys, Jaranc and Moncontour were rewarded in 1569 by his appointment as a privy councillor of the king and grand master of artillery. He commanded the royal forces at the siege of Poitiers in 1568, and he was rewarded with a marshal of France. From 1576 to 1588 he was almost continuously employed in high command. From 1586 he supported the cause of Henry of Navarre, but was suspected of prolonging the civil wars in his own interest. Biron was killed by a cannon-ball at the siege of Epernay on the 26th of July 1592. He was a man of considerable literary attainments, and used to carry a pocket-book, in which he noted everything that appeared remarkable. Some of his letters are preserved in the Bibliothèque Nationale and in the British Museum; these include a treatise on the art of war.

His son, CHARLES DE GONTAUT, duc de Biron (1562-1602), fought brilliantly for the royal party against the League. He was made marshal of France in 1592, and marshal in 1594; governor of Burgundy in 1595, he took the towns of Beaune, Autun, Auxonne and Dijon, and distinguished himself at the battle of Fontaine-Française. In 1596 he was sent to fight the Spaniards in Flanders, Picardy and Artois. After the peace of Vervins he discharged a mission at Brussels (1598). From that time he was engaged in intrigues with Spain and Savoy, and, notwithstanding, directed the expedition sent against the duke of Savoy (1599-1600). After fulfilling diplomatic missions for Henry IV, in England and Switzerland (1600), he was accused and convicted of high treason and was beheaded in the Bastille on the 31st of July 1602.

His collateral descendant, ARMAND LOUIS DE GONTAUT, duc de Lauzun, afterwards duc de Biron (1747-1793), is known for the part he played in the War of American Independence and the revolutionary wars. Until 1788, when he succeeded to the duchy of Biron on the death of his uncle,—Louis Antoine de Gontaut, duc de Biron (1700-1788)—he bore the title of duc de Lauzun, which had passed, on the death of Antoine Nonpas de Caumont, de Lauzun (1633-1723), on his maternal uncle, Charles Armand de Gontaut, duc de Biron (1663-1756). After for a while wasting his fortune in dissipation in various parts of Europe, he attracted attention by an essay on the military defences of Great Britain and her colonies (État de défense d'Angleterre et de toutes ses possessions dans les quatre parties du monde). This led to his appointment to a command against the English in 1779, in which he gained several successes. In the following year he took a conspicuous part in the War of American Independence, and on his return to France was made maréchal de camp. In 1789 he was returned as deputy to the states-general by the noblesse of Querrieu, and attached himself to the revolutionary cause. In 1791 he was sent by the Constituent Assembly to receive the oath of the army of Flanders, and subsequently was appointed to its command. In July 1792 he was nominated commander of the army of the Rhine, with the duty of watching the movements of the Austrians. In May 1793 he was transferred to the command of the army of La Rochelle, operating against the insurgents of La Vendée. He gained several successes, among them the capture of Saumur and the victory of Parthenay; but the incoordination of his troops and the intrigues of revolutionary ministers made his position difficult. He was thereupon accused by the notorious Carlier of incivisme and undue leniency to the insurgents, deprived of his command (July), imprisoned in the Abbaye and condemned to death by the Revolutionary Tribunal. He was guillotined on the 31st of December 1793. Some Mémoires, which come down to 1783, were published under his name in 1822 (new ed. 1858), and in 1865 letters said to have been written by him in 1780 to friends in the country, describing the states-general.

BIRR, or PARRSONTOWN, a market-town of King's county, Ireland, is an agricultural centre, but the Birr, and on a branch of the Great Southern & Western railway by which it is 87 m. W.S.W. from Dublin. Pop. of urban district (1901) 4438. Cumberland Square, in which there is a Doric column surmounted by a statue of the duke of Cumberland, to commemorate the battle of Culloden, is the point from which several principal streets diverge in regular form. The fine castle of Birr, beside its historical interest, has gained celebrity on account of the reflecting telescope erected here (1828-1845) by William, third carle of Rosse. This is 56 ft. in length and weighs 3 tons; and 8 ft. 6 in. in diameter. It is the largest instrument in the world. The model and preparatory schools of the Brothers of the Presentation Order are noteworthy. There is a bronze statue by Foley of Lord Rosse (d. 1867). Some trade is carried on in corn and timber, and in brewing and distilling.

An abbey was founded at Birr by St Brendan (d. 573), to whom the present parish church is dedicated. The district formed part of Ely O'Carroll, and was not included in King's county till the time of James I. A great battle is said to have been fought near Birr in the 3rd century between Cormac, son of Con of the Hundred Battles, and the people of Munster. The castle was the chief seat of the O'Carrolls. In the reign of James I. it and its appendages were assigned to Lawrence Parsons, brother of Sir William Parsons, surveyor-general. From him the alternative name of the town is derived. The castle was more than once besieged in the time of Cromwell, and was taken by Ireton in 1650. It also suffered assault in 1688 and 1690.

BIRRELL, AUGUSTINE (1839-1898), English author and politician, son of a Nonconformist minister, was born near Liverpool on the 19th of January 1850. He was educated at Amersham Hall school and at Trinity Hall, Cambridge, where he went to the bar, and gradually obtained a good practice. In 1883 he became a K.C., and he was professor of law at University College from 1896 to 1890. But it was as a literary critic of unusually clever style and an original vein of wit, that he first became known to the public, with his volume of essays entitled Obier Dicta (1881). In 1889 he was returned to parliament for West Fifeshire as a Liberal. In the House of Commons his light
but pointed humour gradually led to the coining of a new word, "birrelling," and his literary and oratorical reputation grew apace. Whether he was writing miscellaneous essays or law-books, his characteristic style prevailed, and his books on copyright and on trusts were novels indeed among legal textbooks, no less sparkling than his literary *Obiter Dicta*. A second series of the latter, *The Legal Diary of Frederick Locker-Lampson*, appeared in 1892 and various other volumes followed, for he was in request among publishers and editors, and his easy charm of style and acute grasp of interesting detail gave him a front place among contemporary men of letters. Mr Birrell was first married in 1878, but his wife died next year, and in 1888 he married Mrs Lionel Tennyson, daughter of the poet Frederick Locker (Locker-Lampson). At the general election of 1900 he preferred to contest the N.E. division of Manchester rather than retain his seat in Fifeashire, but was defeated. He died valuable service, however, to his party by presiding over the Liberal Convention at a time of division, and at the general election of 1906 he was returned for a division of Bristol. He had been included in Sir Henry Campbell-Bannerman's cabinet, and as minister for education he was responsible for the education bill which was the chief government measure in their first session. But the prolonged controversy over the bill, and its withdrawal in the autumn owing to the refusal of the government to accept modifications made by the House of Lords in the denominational interest, made his retention of that office impossible, and he was transferred (January 1907) to the post of chief secretary to the treasury, which he subsequently retained. Mr Asquith became prime minister in 1908. In the session of 1909 he introduced an Irish Councils bill, a sort of half-way house to Home Rule; but it was unexpectedly repudiated by a Nationalist convention in Dublin and the bill was promptly withdrawn. His prestige as a minister, already injured by these two blows, suffered further during the autumn and winter from the cattle-driving agitation in Ireland, which he at first freely criticized and finally strongly denounced, but which his refusal to utilize the Crimes Act made him powerless to stop by the processes of the "ordinary law"; and the scandal arising out of the theft of the Dublin crown jewels in the autumn of 1909 gave a further blot on the Irish administration. On the other hand his scheme for a reconstituted Irish Roman Catholic university was very favourably received, and its acceptance in 1908 did much to restore his reputation for statesmanship.

**BIRTH** (a word common in various forms to Teutonic languages from the root of the verb "to bear"), the act of bringing forth a child, or the fact of its being born; so also a synonym for descent or lineage. In law, a child not actually born, but *en ventre sa mere*, is supposed for many purposes to be actually born, and may be registered as such if it should have subsequently been actually born, i.e. it may take as legatee or devisee, or even as next-of-kin or heir, but none of these conditions will take effect, unless the child is born alive (see MEDICAL JURISPRUDENCE). The given year of age of a child is gained at the first instant of the day preceding the birthday, and no account is taken of parts of a day, e.g. a child born at 11.59 on the night of the 2nd-3rd of May 1900, would be of age the first moment after midnight of the 1st-2nd of May 1921. In English law, by the Offences against the Person Act of 1861, it is a misdemeanour punishable by a maximum term of imprisonment with hard labour, to endeavour to conceal the birth of a child by any act of disposition of its dead body, whether the child died before, after or at its birth.

**Registration of Births.**—The registration of births is said to have been first introduced by Thomas Cromwell when vicar-general in 1538, but it is only in comparatively modern times that registration has been fully carried out. The law relating to the registration of births was consolidated for England by the Births and Deaths Registration Act 1874, and for Ireland by the Births and Deaths Registration Act (Ireland) 1881. In Scotland it depends upon the Law of Registration of Births, Deaths and Marriages (Scotland) Act 1852, as amended by subsequent acts. Presumably up to the passing of the Births and Deaths Registration Act 1836, the records of the births were compiled from parish registers, which were formerly a part of the ecclesiastical organization, and continued to be attached, more or less, to the church till the passing of the act of 1836. That act provided a far more complete machinery than that before existing for the exact record of all births. The new system relieved the clergy from all functions previously thrown upon them, and finally, after improvement by subsequent acts, was made compulsory in 1874. The act of 1836 established a general register office in London, presided over by an officer called the registrar-general, with general superintendence over everything relating to registration. The registrar-general is appointed under the Great Seal. Every poor-law union or parish is divided into districts, each of which is called by a distinct name, and is in charge of a registrar, who is a local officer appointed by the guardians of the union. Over each union is a superintendent registrar, who has supervision over the registrars within his district. The office of superintendent registrar is usually filled by the clerk to the guardians of the union. He receives quarterly from every registrar within his district certified copies of the births registered by him and having verified their correctness, transmits them to the registrar-general.

He takes charge of the register-books within the district, when filled. Every registrar is required to inform himself carefully of every birth which happens within his sub-district and register the same, with the various particulars required, according to the forms laid down for the purpose. It is the duty of the father or mother of any child born alive, or in their default, then of the occupier of the house (if he knows of the birth) or any person present at the birth or having charge of the child, to notify to the registrar within the specified time the fact of the birth, information of the particulars required to be registered concerning the birth, and in the presence of the registrar to sign the register. Every person required to give information concerning any birth who wilfully refuses to answer questions put to him by the registrar concerning the particulars required to be registered, or who refuses or fails without reasonable excuse to give information of any birth, becomes liable to a penalty of forty shillings. After three months a birth can only be registered in the presence of the superintendent registrar, and the expiration of twelve months a birth can only be registered with the written authority of the registrar-general. In the case of an illegitimate child, no person as the father of such child is required to give information, nor is the name of any one entered in the register as the father of such a child, unless at the joint request of the mother and the person who acknowledges himself to be the father. An additional duty is placed upon the father by the Notification of Births Act 1907. By that act it is the duty of the father of a child if he is actually residing in the house where the birth takes place at the time of its occurrence to give notice in writing of the birth to the medical officer of health of the district in which the child is born by three o'clock on the third day after the exact time of thirty-six hours of the birth. The same duty is also imposed upon any person in attendance (i.e. medical practitioner or midwife) upon the mother at the time of or within six hours after the birth. The medical officer of health is then in a position to take such steps, by advice or otherwise, as may, in his opinion lead to the prevention of infant mortality. Notice under the act is given by posting a prepaid letter or postcard to the medical officer of health giving the necessary information. Failure to give notice entails summary conviction a penalty not exceeding twenty pounds. In England the medical officers of health or other local authorities, but may be enforced within any area by the Local Government Board. By the Births and Deaths Registration Act 1874 and the Merchant Shipping Act 1894, commanding officers of ships trading to or from British ports must, under a penalty, transmit returns of all births occurring on board their ships to the registrar-general of shipping, who furnishes certified copies of such returns to the registrars-general for England, Scotland and Ireland. These returns of births (and deaths) constitute the "Marine Register Book." Registration is generally not carried out in practically every European country, with the exceptions of Turkey and Russia. In the United States laws requiring registration vary in the different states.
BIRUNI—BISCAY, BAY OF

Tax on Birth.—In 1694 an act was passed in England for allowing to His Majesty certain rates and duties upon marriages, births and burials, upon bachelors and widowers for the term of five years, for carrying on the war against France with vigour. The rates were graduated, rising from four shillings on the birth of the humblest person to £50 in the case of a duke or duchess. The duties were paid according to the rank of the parents. A duke paid £50 on the birth of an eldest son, and £25 for every other child; a baronet or knight, £5 for an eldest son, and £1 each for other children. An archbishop or bishop, or a doctor of divinity, law or physic paid £1 for every child; a gentleman having a personal estate of £500 or a real estate worth £50 per annum, paid ten shillings on the birth of each child. Every other person not receiving alms paid a tax of two shillings on the birth of each child. This measure, however, was only temporary, and passed for revenue purposes solely.

BIRUNI [Abûl-Râhmân Muḥammad al-Birûnî] (973-1048), Arabian scholar, was born of Persian parentage in Khwarizm (Khiva), and was a Shi’ite in religion. He devoted his youth to the study of history, chronology, mathematics, astronomy, philosophy and medicine. He corresponded with Ibn Sinâ (see AVICENNA), and the answers of the latter are still preserved in the British Museum. For some years he lived in Jurjân, and then he went to Persia, where he remained some years tramping over Greece, learning philosophy and learning Indian. In 1017 he was taken by Maḥmûd of Ghazni to Afghanistan, where he remained until his death in 1048. His Akhâr ul-Bâkiya (Vestiges of the Past) was published by C. E. Sachau (Leipzig, 1878), and a translation into English under the title The Chronology of Ancient Nations (London, 1879). His History of India was published by C. E. Sachau (London, 1887), and an English translation (2 vols., London, 1888). Other works of his, chiefly on mathematics and astronomy, are still in manuscript only.

See Brockelmann, Geschichte der arabischen Literatur (Weimar, 1898), vol. i. pp. 475-476.

BISALTAE, a Thracian people on the lower Strymon (Struma; Karasu, “black water”), in the district between Amphipolis and Heraclea Sintica on the east and Crestonice on the west. They also made their way into the peninsulas of Acte and Pallene in the south, beyond the river Nestus in the east, and are even said to have raided Cardia. Under a separate king at the time of the Persian wars, they were annexed by Alexander I. (498-454 B.C.) to Macedonia. The district of Macedoniana was divided into four districts by the Romans after the battle of Pydna (168) the Bisalatae were included in Macedonia Prima (Livy xlv. 20).

Their country was rich in figs, vines and olive trees; the silver mines in the mountain range of Dysorum brought in a talent a day to their conqueror Alexander. The Bisalatae are referred to by Virgil (Georgics, iii. 461) in connexion with the treatment of the diseases of sheep. The fact that their eponyms is said to have been the son of Helios and Ge points to a very early settlement in the district.

See Smith's Dict. of Greek and Roman Geography; M. Ihm in Pauly-Wissowa's Realencyclopädie, iii. part i. (1897); W. Tomasek, Die alten Thraker (Vienna, 1893); and for the coins of the Bisalite kings, B. V. Head, Historia Numorum, p. 178.

BISCAY (Vizcaya), a maritime province of northern Spain; bounded on the N. by the Bay of Biscay, E. by Guipúzcoa, S. by Álava and W. by Burgos and Santander. Pop. (1900) 311,307; area, 836 sq. m. A small strip of isolated territory within the borders of Biscay, on the west, is officially included in the province of Santander. Biscay is one of the Basque Provinces, and its name is occasionally employed as geographically equivalent to Basque, in that case including the three provinces of Biscay proper, Guipúzcoa and Álava. The coast-line, which extends from Ondarroa to a short distance east of Castro Urdiales, is bold and rugged, and in some places is deeply indented. The surface of the country is for the most part very mountainous, being traversed towards the south by the great Cantabrian range, but at the same time it is diversified with numerous narrow valleys and small plains. Some of the mountains are almost entirely composed of naked calcareous rock, but most of them were formerly covered to their summits with forests of oaks, chestnuts or pine trees, now destroyed to provide fuel. Holly and arbutus are common, and furze and heath abound in the poorer parts. The only river of any size is the Nervión, Ansa or Ibaizabal, on which Bilbao is situated; the others, which are numerous, are merely large mountain streams. The climate is rather inclement and variable; but the thermometer seldom drops below freezing point, nor does snow fall frequently in winter except on the highest summits. The rainfall is on an average greater than in any province except those of the extreme north-west. The soil, though not very fertile, except in some of the valleys and sheltered hill-sides, produces wheat, maize, barley, rye, flax, grapes, peaches, apples and other fruits. The mountainous slopes of Biscay are studded with the traditional Basque caserio, or farmhouse, in which the peasantry live on the mêlée system, dividing the profits of the soil with absentee landlords. The farms are generally small, and are for the most part tilled by manual labour. The fisheries are actively prosecuted along the coast by a hardy race of fishers, who were first of their craft in Europe to pursue the whale, formerly abundant in the Bay of Biscay. Cod, bream, tunny and anchovy are the principal fish taken. The fishing fleet consists of several hundred boats, manned by nearly 5000 men and boys. Biscay is very rich in minerals. Iron of the finest quality is found in almost every part, and forms a main article of export. At the beginning of the 20th century an average of about 5,000,000 tons was produced every year, and a large number of industry, lead, copper, and zinc are mined in much smaller quantities, alum and sulphur are also present, and marble, lime and sandstone are abundant. Another very important industry is the manufacture of dynamite and other explosives at Baracaldo, closely connected with the mining interests. There are also potteries, paper, soap and shoe factories, flour mills and breweries, and the many mineral springs and spas are frequented by people from all parts of Spain. The mining and industrial interests of Biscay were very materially assisted by the quick and important development of means of communication of every kind. The provincial and parish roads kept up by the local government, are excellent. No province in Spain had at the beginning of the 20th century such a complete network of railways, all built since 1870.

Bilbao (pop. 83,306), the capital and principal port, and Baracaldo (15,031), an important industrial town, are described in separate articles. Sestao (18,833) is the only other town of more than 10,000 inhabitants; the port of Bermeo (9061) is the chief fishing station; Durango (4310), on the river of the same name, was founded by the early kings of Navarre in the 11th century, containing the ancient seat of the bishop in 1553, and contains the oldest churches in the Basque Province; San Pedro de Tavira; Guernica (3250), a picturesque village on the river Mondaca, was until 1876 the meeting-place of the provincial parliament. The deputies assembled under an old oak-tree, celebrated by the Basque poet, José María Iparraquíre, in a song which is regarded by the Spanish Basques almost as a national anthem. For the history of the Basques, see BASQUE PROVINCES; for their origin, language and customs, see BASQUES. The inhabitants of Biscay are intelligent, enterprising and well-educated; and, owing to the uniformly high birth-rate, low death-rate, and very small increase of population, their numbers increased rapidly during the latter part of the 19th century, until in 1900 the density of population (372.4 per sq. m.) was greater than in any other Spanish province.

BISCAY, BAY OF (Fr. Golfe de Gascogne; Sp. Golfo de Vizcaya), an inlet of the Atlantic Ocean; bounded on the E. and N.E. by France, as far as the island of Ushant, and on the S. by Spain as far as Cape Ortegal. The Bay of Biscay is the Sinus Aquitanicus, Sinus Cantabricus or Cantiber Oceanus of the Romans; hence it is sometimes known as the Cantabrian Sea. Its modern English name is a corrupt form of the Spanish Vizcaya. Its southern boundary forms a fairly regular curve, broken on the French sea-board only by the estuaries of the Loire, Garonne, Adour and other rivers. The rugged Spanish coast is indented by many
The most extensive, and in minutes. Few and largely a porcelain, "canopied 30,885. Flower, copal unimportant.

The BISCUIT to jute, machinery, (pronounced iron-founding. To the battle, on the 12th of May 1813, between the French and the Allies after Napoleon's retreat from Moscow. In the days of Benno, bishop of Meissen, in the 11th century, and the "Bishop's Road" still runs from here to Meissen.

BISCHOFSWERDA, a town of Germany, in the imperial territory of Alasce-Lorraine, district of Lower Alasce, 23 m. by rail N. by E. from Strassburg. Pop. (1800) 7897. It has manufactures of jute and machinery, brewing and iron-founding.

BISCEGLIE (perhaps anc. Natilium), a seaport and episcopal see of Apulia, Italy, on the S.E. coast, in the province of Bari, from which it is distant 21½ m. by rail. Pop. (1901) 30,885. Two towers, one some 90 ft. high, of an once strong Norman castle still remain; the cathedral belongs to the same period. The church of S. Margherita, founded in 1197, has fine canopied Gothic tombs of the Falcone family.

BISCHWEILER, a town of Germany, in the imperial territory of Alsace-Lorraine, district of Lower Alsace, 23 m. by rail N. by E. from Strassburg. Pop. (1800) 7897. It has manufactures of jute and machinery, brewing and iron-founding.

BISCEGLIE—BISECTRIX

 fjord-like inlets, especially in the west, where navigation is sometimes difficult and dangerous; but its rivers are comparatively unimportant. The exposed position of the bay, and the diversity of its currents, have rendered it notorious for its storms.

is the feeding of portions of this slab of dough to a cutting and panning machine. In details this apparatus differs as supplied by different makers, but the broad principle is the same in every case. The dough, after first passing through a pair of gauging rollers, which still further thin out the sheet and are capable of regulating its thickness with the utmost nicety, is received by an endless conveyer-band of webbing or similar material. By this band it is carried forward by intermittent motion to a set of punches or stamps which, in quick succession, and serve to mould the surface and cut the edges to the required pattern. This operation completed, the moulded dough passes forward on the endless band. The dough has now been cut into two distinct divisions, the moulded biscuits and the unworked portion which forms a continuous sheet of a sort of scrap. The latter is separated from the moulded dough, and is carried upwards by another band, which delivers it on a tray or box whence it is returned to the rollers to be reworked. The moulded dough intended for the sojourn in the oven, and discharged at the opposite end. Some ovens are provided with a sort of endless belt of iron plates on which the biscuits are placed. These travelling bands are used chiefly for ship and also for dog biscuits, but the most usual type is the oven in which trays are moved on the travelling chains already described. The exact rate of travel, or the time during which the biscuits are in the oven, can be easily adjusted by means of counter-shafts and leather belts running on cone pulleys fitted at the discharging end. The heat of the oven as well as the rate of travel is varied according to the kind of biscuit, some varieties requiring a gentle heat and a comparatively long sojourn in the oven, while others must be exposed to a fierce heat, but only for a few minutes. The ovens, fired by coke, may be 30 ft. in length. Their temperature is not generally raised above 500 degrees, but the speed of travel of the trays ranges between 18 and 25 minutes. The whole process of biscuit-making is thus rapid and continuous. The dough is kneaded in the mixers in a few minutes, and when discharged on the dough table is rapidly moulded into the required form by the cutter and panner. By means of endless bands the material is kept moving forwards, whether on the cutter or in the oven. For certain fancy biscuits special processes are used. Piping and sugar decoration is still necessarily done by hand, and the glaze on some fancy biscuits is imparted by spraying the moulded biscuit with very fine jets of fresh milk. Cracknels are made from a very stiff dough, and when cut out are thrown intooppers of boiling water. They speedily float to the top, remaining apart and not forming into groups. From these coppers they are taken out in trays pierced so as to drain off the water. Then they go into vats of cold water, from which they are again removed, and after being strained of their moisture are panned and baked in a fierce oven. (G. F. E.)

BISECTRIX (fem. of Lat. bisector, from bi-, two, secare, to cut), i.e. a point which divides a line, or a line which divides an angle, into two equal parts; in crystallography it describes the bisector of the angle between the optic axes.
